cited over recent discoveries in that vicinity. A few weeks ago we made mention of a claim located by Doc. Holmes, showing good prospects. It seems that further development on this claim has exposed a well-defined ledge, seven feet wide, which assays over \$100 to the ton, and gives promise of increasing in quantity and richness as it is opened out. This has set others to prospecting, and our informant states that claims are being staked off all round the prospect location. Doc. Holmes' mine is about half a mile due east of the mouth of the Eberhardt & Aurora tunnel, but on higher ground, and easily accessible by wagon.

**THE SHAFES.**—Work on the Jennie A. and Kingmines, on White Pine mountain, has been somewhat retarded for the last two weeks on account of bad ventilation, which necessitated the sinking of air shafts. This work has now been completed in both mines, and the work of development resumed. The Jennie A. has put in an air-blower to clear the mine of deleterious gases which settle at the bottom of the incline. Neither company expect any more trouble on account of ventilation for a long time to come.

**A RICH SPECIMEN.**—Yesterday we saw a beautiful specimen of silver ore from the Safford mine, on Treasure Hill. Experts say it will go \$1,000 to the ton, and the gentleman who took it out assures us the ore body from which the specimen was taken showed a breast of 30 feet and was 10 feet high.

## Arizona.

**MINERAL PARK.**—Cor. *Arizona Enterprise*, Aug. 15: In Mineral Park I found times very dull, but it is expected that the mill will start up soon and run on custom ore and tailings, in which case the town will again have life distilled into it.

There are ten or twelve men chloriding on the Keystone, and they are getting out some ore that will work as high as \$1,200 to the ton.

**MAYNARD DISTRICT.**—A mill will soon be put up on the Dean mine in Maynard district, Wallapai mountains. The parties who bonded the mine have paid \$13,000 in cash. They are to put up a 10-stamp mill on the mine, and if they do not, by the 1st of August, 1878, pay down \$200,000, they are to forfeit the mill and the \$13,000 already paid. Mr. S. Shoultes has recently shipped from the American Flag mine, also in Maynard district, about eight tons of ore that will work \$2,000 per ton.

The old Hackberry mill has been fixed up to work tailings, and it is turning out a considerable quantity of bullion. A day or two ago Mr. Towle, one of the owners, passed through here, en route to the river, with \$6,000, or \$7,000 worth of bullion extracted from these tailings. The new mill will be up in a few months, and then look out for lively times in the vicinity of this famous rich mine. On the 450-ft level they have struck a large body of rich ore, and the mine at this depth makes a better showing than ever before.

**AZTEC.**—*Arizona Citizen*, Aug. 15: Manager Magee came in from the Aztec mine yesterday, with the best of news regarding its development. There is in the open cut a body of solid ore, 6x8 feet, of very rich ore. He brought in about 100 pounds, one piece weighing over 50, and bears evidence of coming from a large vein. Samples of this class of ore were recently assayed in San Francisco, and gave over \$200 per ton. Mr. Magee is about as well pleased with the prospects as any man would care to be under like circumstances.

**ORO BLANCO.**—Mr. Flood is in town from Oro Blanco district. He says the Alaska, Warsaw and other veins himself and partners are developing, show so favorably that next week they intend to begin building a furnace of a daily capacity of five tons. As Mr. Kirkpatrick said some weeks ago when in here, it is the intention to build up gradually and make no failure. They have the ore with silver in paying quantities, and they do not intend to put up very extensive or expensive machinery until they demonstrate just the kind needed to work the ores most profitably.

## Montana.

**SILVER CREEK QUARTZ.**—*Helena Independent*, Aug. 16: Mr. John Murphy is running his mine, which is reported to be paying well. Up the Silver creek road, Messrs. Mayer & Collins have a forest of 10 men at work. The mine pays its owners well. Mr. Thos. Cruse has an arastra near Collins & Mayer's mine. He is crushing ore from the Dinnunum lode, and is doing first-rate. A few miles above is the little town of Idaville. There is a 10-stamp mill and two arastras running steadily and producing a good deal of gold retort. Further up is the town of Cotterville, which is growing rapidly. At this place is located a 10-stamp mill, belonging to Mr. Milo Courtwright. The Bluebird lode, which furnishes the above mill with ore, is a very fine one and is yielding about 40 tons per day. The lode is 18 feet wide at the bottom of the shaft—56 feet. Several levels are being run. There is now on the dump 400 tons of good ore. The owners, Cotter, Hickey & Tierney, expect to erect a 20-stamp mill this fall. Henry Brooks has struck an extension of the Bluebird, and it is as rich as the original. There are several other fine lodes in the neighborhood. There is no doubt that at no distant day this district will be regarded as the most productive in the Territory.

**SILVER MILL IN ELK HORN DISTRICT.**—*Butte Miner*, Aug. 16: Hon. C. Mead, of Bannock, left Butte on Saturday, with a large portion of the machinery for a silver mill he is building in the Elk Horn district, Beaverhead county. The mill will consist of a 25-horse power boiler and engine, six 70-pound stamps, two Purvine pans of large size and one Purvine settler. Will crush and treat a capacity of eight tons per day. The ores of this district are measurably free from lead, zinc, antimony and arsenic; are rich in silver and carry a liberal percentage of carbonate and oxide of copper, with silicious gangue, which, with the fact of their great abundance, makes them very desirable ores for raw amalgamation. The Judge expected himself to be much pleased with Butte, and well satisfied with the work done at A. F. Allen's foundry, which is now turning out castings of excellent quality and good finish. Such enterprises as this of Judge Mead's will do more to give Montana railroad communication with the outside world than all the cheap talk and poor legislation of an entire age.

## Oregon.

**APPROPRIATE MINES.**—*Oregon Sentinel*, Aug. 15: This section of country is becoming famous for the new mines that have been discovered there of late. Very little work has been done so far to prospect them, but the indications are that it will pay to take one of our mining districts. The great advantage it has over our other mines is the abundance of water which can be brought to the mines at a very small cost. The ditch of Pape, Smith & Co. has been completed and work commenced, and they will now have a sufficiency of water to work their claim all the year round. That of Klippel, Hanna & Co. is in course of construction, and will be finished this fall. Considerable capital has been brought into this county lately, which is being used in developing our mines, and a prosperous season may be expected.

## Utah.

**BEAVER DISTRICT.**—Cor. *Salt Lake Tribune*, Aug. 16: Matters remain at a stand-still here in this camp, and I am afraid will continue to for a number of weeks to come unless lead takes another bound and goes up to \$65 at least. Mr. Schofield, the business manager of this smelter, visited us a short time ago and paid up the indebtedness of the concern, and then started for New York. He states that he will return and start things again. The mines look well—those that are being worked—and the Gentile miners are running. The new Godbe smelter will start up soon; the town is growing, and the Big Horn silver mine still gets bigger and richer. The smelter at Millford is also running. Bring down the price of transportation and the price on goods, and the

miner can live in this part of Zion, even at the low price of lead. We don't mean to give up the ship, at any rate.

**SILVER REEF.**—*Pioche Record*, Aug. 18: From Captain Lubback we learn that affairs at Silver Reef, Utah, are moving along with rather better prospects. The Last Chance mine, on Tecumseh Reef, had struck a rich body of ore. Barber is having his ore crushed at the Goss mill, which is working satisfactorily, except in regard to prices charged. The Captain shipped a wagon load of hardware from Pioche to Silver Reef for use in the mines of which he has charge.

**LEADS BULLION.**—\$9,797.76 in bullion arrived in Pioche from Silver Reef during the week.

## The Progress of the Sutro Tunnel.

The Sutro tunnel, one of the great engineering feats of the century, is already within the eastern boundaries of the great Comstock lode, which it is designed to tap, and there are less than 2,000 feet to run to bring the header into the Savage mine workings. The fact is now established that the workmen at the bottom of the Savage-Chollar-Norcross combination shaft and those in the tunnel can bear each other blasting; the first connection of the tunnel will be with this shaft. The question of the utility of the tunnel, and the numerous arguments in connection with the matter, have been discussed so thoroughly that there is no necessity of anything being said on the subject at this time. Great energy has been displayed by the projectors in every way, and the work has been skillfully carried out as well as quickly. More than ordinary interest is centered in the tunnel at this time, as many advantages are expected from its connection with the lode, and it is now at a place where it will settle many questions in connection with the quartz veins to the eastward.

The tunnel was started the 19th of October, 1869, and during the remainder of that year 460 feet were cut. The *Gold Hill News* publishes the following figures of comparative progress, which are of interest:

In 1870 the total progress made was 1,200 feet, and the average monthly progress 107½ feet. During 1871 the total distance run was 915 feet, and the average monthly progress 76¼ feet. In 1872 the total progress was 815 feet, and the average per month 66½ feet. During 1873 the total distance run was 1,919 feet, and the average per month, including 555 feet of drifts run east and west from the bottom of shaft No. 1, was 105 4-12 feet. In 1874 the total distance made was 2,680 feet, the average per month being 223 4-12 feet. On the first day of April of that year the first Burleigh drill was started. June 2d four drills were in operation, and on the 7th day of August, six drills were at work in the face. During 1875 the total distance made was 3,728 feet, and the average per month 310 8-12 feet. In 1876 the total distance run was 3,670 feet, and the average per month 305 10-12 feet. During 1877 the total distance run to August 1st was 2,134 feet, and the average to that date was 305 feet. Since the first of August the average daily progress has been about 11 feet, so that, if nothing serious happens to prevent, the total progress for the year 1877 will not fall much, if any, short of 4,000 feet. At the present rate of work an average of 2,000 car loads of rock, weighing two tons each, are removed monthly.

A *News* reporter entered the tunnel this week, and we condense the following from his observations: It was time for changing shifts, and our party were clad in the most grotesque habiliments, with a long train of low cars following after, each car loaded with four brawny miners in working costume, and carrying flashing lights. The whole train was drawn by a stout mule, with a flaming torch fastened to its collar to light it through the midnight gloom. Taken together with the continually changing scenes of the tunnel, as they flitted quickly past us, the whole formed a comic and interesting picture. The distance from the mouth to face of the tunnel is 17,797 feet, a little less than three and one-half miles. Our mule was driven the greater part of the distance at a fast trot, and it was just one hour from the time of starting until we reached the face of the header, or end of the tunnel.

The face of the tunnel is in soft porphyry, carrying streaks of clay, the whole having the exact appearance of the material that lies next to and adjoining the east wall of the Comstock. It is of just such a character as would lead a miner or an expert to expect the striking of a quartz ledge at any moment. The face of the tunnel has now reached a point 300 feet west of shaft No. 4, and 642 feet east of a direct north and south line from the Savage-Chollar-Norcross combination shaft, which point is 18,439 feet from the mouth of the tunnel. The flow of water from the header is 73 inches. The temperature of the water at this point is 94 and at the mouth of the tunnel 77 degrees Fahrenheit. The temperature of the air at the header is 97 degrees, but is pure, and the men have no difficulty in working. The compressed air for driving the drills in the face and ventilating the tunnel is brought from shaft No. 2, a distance of 10,487 feet. The number of men employed in the header at present is 49, one shift of which, the day before our visit, sent out 42 carloads, containing two tons each, of rock.

A drain tunnel, 1,100 feet in length, has been completed from east of the machine shop, at the mouth of the tunnel, and a shaft sunk 60 feet

in depth to the level of the tunnel. The design of this drain is to create a fall of 60 feet for the water, to obtain a sufficient power to run the entire machinery of the machine shop without the cost of steam. The water from the tunnel will be turned downward through this shaft, at the bottom of which one of Leffel's 13½-inch turbine water-wheels will be placed, capable of making 700 revolutions per minute, and which will furnish 50-horse power. This, it is estimated, will run with ease the entire machinery of the shop. The water, after passing through the drain, will then be used for irrigating purposes by the farmers along the banks of the Carson. The total number of men employed at the tunnel, including foremen, clerks, miners, and other employees, is 82. Mr. Sutro confidently expects the tunnel to reach the workings of the main Comstock by the 1st of January, 1878.

## The Mechanics' Institute Library.

The exhibitions which are given under the auspices of the Mechanics' Institute are not for the individual profit of any one person or set of persons. Whatever profits there are are turned over to the treasury of the Institute, but if there are any losses, the Trustees have to bear them personally. This is a great risk to run or the Trustees, but not for the Institute. The Trustees take all the trouble and risk, with no chance of profit, so that the Library Association reaps the benefit without expense or chance of loss.

The object for which these exhibitions are given is in every way a worthy one. The collection of a large public library is no easy or inexpensive task. To obtain a good standard, as libraries are rated now-a-days, a great deal more money must be spent than usually comes from the monthly subscribers alone. This income is about sufficient to keep the library running, but when it comes to purchasing even half of the books that are published and worthy of a place on the shelves, this amount is insufficient. Text books and works of reference especially are costly, and this class of works are more in demand than others at a Mechanics' Institute.

The library has now a splendid set of works of reference, and is a credit to the city and the coast. New works, however, come out every day and a certain proportion of these are absolutely necessary to keep the library up to the proper standard. With the ordinary funds of the library it would be impossible to make any reasonable additions to the stock of books. For this reason, these exhibitions were inaugurated so that the library would have some pecuniary gain outside of its ordinary income.

The experiment proved so successful that eleven different exhibitions have been given under the auspices of the Institute. These fairs serve also a double purpose, as they give an opportunity for mechanics and manufacturers to display the result of their handiwork and skill in the different branches, and afford to the residents of the coast an opportunity to examine for themselves what can be done here. The Industrial Exhibition deserves the hearty support and encouragement of all progressive citizens, when it is given for such worthy objects.

## A Handy Workman.

Mr. I. A. Heald, machinist, 514 Commercial street, in this city, is an artisan of the right stamp—a man of "good mettle" and "true ring." His work is ditto. We have known him for many years, and can recommend him fully. The *Washington City Chronicle* describes Mr. Heald's former shop in that city in the following happy manner: "We were truly amazed at the skill being there displayed. Models of the most intricate character, machiucs composed of many parts, and of various kinds of metal and wood—all, when set in motion, working smoothly and in perfect order. Every manner of tools are kept on hand with which to perform this difficult work. Models for patents and general machine jobbing are all executed, either in wood or metal, at short notice. Sewing machines, printing presses, musical instruments, and, in fact, anything composed of wood or metal, will be neatly and promptly executed under the immediate supervision of Mr. Heald himself, he having had a large experience at the Washington navy yard, and in other cities. Mr. Heald is also an accomplished musician, being leader of the American brass band."

## Meetings and Elections.

**MARTIN WHITE M. Co.**—August 16. Directors—Annis Merrill, Jno. A. Hooper, C. H. Stanyan, F. D. Sawyer and Mark Shepard.

**CALEDONIA M. Co.**—August 17. Trustees—Geo. W. Beaver, L. S. Adams, R. F. Morrow, W. S. Hobart, John S. Hobart, John Skaa. Officers: Geo. W. Beaver, President; L. S. Adams, Vice-President; R. Vaguer, Secretary.

**OCCIDENTAL M. Co.**—August 17. Trustees—F. H. Follis, C. H. Fish, Geo. R. Wells, Geo. Wallace, C. O'Connor, Officers: R. H. Follis, President; James G. Fair, Superintendent; A. K. Durbrow, Secretary.

**LUCY ROCK M. Co.**—August 20. Trustees—L. L. Blood, Chas. K. Colby, Ernestus Gunn, Jas. Kellogg, G. L. F. Reen. Officers: L. L. Blood, President; E. G. Colby, Superintendent; Chas. S. Healy, Secretary.

**KENTUCKY RUCO M. Co.**—August 20. Trustees—B. A. Becker, J. B. Reynolds, Jas. K. Byrno, G. S. Johnson, Chas. Snyder, Officers: B. A. Becker, President; F. J. Herrmann, Secretary.

FRED. A. MOORE has become local editor of the *Santa Barbara Press*.

## PATENTS AND INVENTIONS.

### A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch, Dated Washington, D. C., August 7th, 1877.

FOR WEEK ENDING AUGUST 7TH, 1877.

**FIRE ESCAPES.**—Benjamin F. Frank, Colfax, Cal.  
**TIGHTENING AND STRETCHING ROPES, BELTS, ETC.**—William Eppelsheimer, S. F.  
**CARPET FASTENERS.**—Jesse Tailing, Umatilla, Oregon.  
**DRIERS FOR FRUIT AND OTHER ARTICLES.**—George Harris, Petaluma, Cal.

LABEL.

**THE STOCK CONDITION POWDER.**—Painter & Calvert, S. F.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

## General News Items.

SEVEN thousand men will leave Spain for Cuba between now and the 20th of September.

THE Western Union and Atlantic and Pacific Telegraph Companies have been consolidated, and are now practically one company.

THE failure of Gamewell & Co., builders of fire alarm telegraph lines, was announced in New York Saturday.

THEY have recommended shipping ore from the copper mines at Copperopolis, above Stockton, to Europe.

THE Treasury Commissioners are engaged in making a series of practical tests, with the view of ascertaining the actual consumption of fuel at the Mint.

PAPERS are being prepared, at the instance of J. C. Morrison, Jr., complaining of a Chinese washhouse, next door to his residence on Howard street, as a dangerous nuisance.

THE Newark City Silk Mills, of Newark New Jersey, have resumed work with half their usual force, with wages as agreed upon by the proprietors and strikers. The Vise and Tool Works at Treuton, New Jersey, have also resumed work.

THE *Sun's* Scranton special says: Between 50,000 and 60,000 miners are now idle in this district, and it is estimated that the sale of at least 300,000 tons of coal has been lost to this region since the strike began. One lot of miners rejected the terms of the masters, demanding an advance of 25 per cent. in wages.

THE Treasury Department declares the importation of sugars, artificially colored for the purpose of securing their entry at the Custom House at a lower rate of duty than would be charged upon colors attained in the ordinary process of manufacture, is regarded as a direct evasion of the revenue law, and all importations of that character made in the United States after October 1st next, will be seized for forfeiture.

THE annual State Fair of California will commence at Sacramento on the 17th of September, and continue through the week. It is the intention of the managers to make the exhibition complete; and \$40,000 in cash premiums will be distributed. The racing will be a prominent feature, and will include the best stock. A premium of \$100 will be offered for the most valuable gold bar exhibited.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

A VALUABLE MINING BOOK

BY J. S. PHILLIPS.

The Explorers', Miners and Metallurgists' Companion  
652 pages, 33 illustrations. Second Edition. A California  
publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and  
meet the requirements of those for whom it has been  
written.—*London Mining Journal*.  
The most practical and comprehensive work on mining  
subjects extant, and valuable book of reference.—*Mining  
and Scientific Press, San Francisco*.  
We know of no work on these subjects in the English  
language at once so comprehensive, practical and intelli-  
gible.—*S. F. Golden Era*.  
He has rendered to the leading industry of the coast a  
valuable service—has furnished the millman and miner a  
safe and much needed practical guide.—*Overland  
Monthly*.  
This book, which treats in an intelligent and practical  
way on almost every topic connected with mining pursuits,  
should be in the hands of every millman, metallurgist,  
prospector and miner on the Pacific coast. Even the cap-  
italist, and in fact, every person already engaged in, or  
likely to become interested in the business of mining,  
will find in this comprehensive work an amount of infor-  
mation that they cannot afford to dispense with.—*S. F.  
Commercial Herald*.  
This book is free from trash, and solid throughout; all  
its matter is intelligible to men of ordinary education, and  
it is the best single work to use, as we know for the use  
of prospectors and practical miners.—*The Engineering  
and Mining Journal, New York*.  
It is very comprehensive, and contains a great deal of useful  
information which cannot be obtained from the previous  
books that have been written on these subjects.—*S. F.  
Daily Examiner*.  
It affords a vast quantity of information as to the ap-  
pearance and value of different ores.—*S. F. News Letter*.  
It is the best single work to use, as we know for the use  
of prospectors and practical miners.—*The Engineering  
and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price  
\$10.50.

Questions of the Times.

Which are the most reliable watches?  
American watches are driving those of foreign  
make out of the market.  
Which is the best American watch?  
The New York watch, made at Springfield, Mass.  
Why is it the best watch?  
Because it is substantial in all its parts, constructed on  
the best principles and embodies those improvements  
which experience has shown to be the most desirable.  
Why is the New York Watch so popular?  
Because in buying one you are sure of getting a good  
time-keeper. While purchasing a watch of most other  
makes is like investing in a lottery—a great many blanks  
to one prize.  
Which is the cheapest watch?  
The most economical is the New York watch. For you  
can get one of these excellent time-keepers for less than it  
costs in a short time to patch up a poor watch, which  
benefits no one but the repairer.  
Where can I get a New York Watch?  
By addressing the long established, practical Watch-  
makers and Jewelers, DEWEY & JORDAN, 433 Mont-  
gomery St., San Francisco, who will send you a descriptive  
price list, including the following styles of movements:  
"John Hancock," "Geo. Sam. Rice," "Chas. E. Hayward,"  
"Aaron Bag," "Theo. E. Studley," "Chester Woolworth,"  
"Frederick Billings," "Railway," "John L. King," "E.  
W. Bond."

TESTING AND WORKING SILVER ORES.—This is the title  
of an illustrated work of 114 pages, for Miners and Pros-  
pectors, by Chas. H. Aaron, published by Dewey & Co. It  
is written for miners, in plain language, and with all nec-  
essary details in description. The author describes the  
different processes of roasting ores, the appliances, meth-  
ods of testing ores, testing for a process, working sam-  
ples, treatment of base metals, use of chemicals, leaching  
processes, different kinds of crushing apparatus, etc.  
This little work abounds with useful hints to miners and  
prospectors, and is written in a practical style. Price,  
post free, 82 cts. Address, Dewey & Co., Mining and  
Scientific Press, 224 Sansome St., San Francisco.

SANTA CLARA, CAL., April 6th, 1875.

MESSRS. DEWEY & CO., GENTS:—We have just received  
Patent No. 100,535, for J. T. Watkins & Co.'s Mammoth  
Road Grader, which was patented through your Agency.  
It is the nearest and best that we have ever received. We  
feel proud of it and thankful to you for the care and at-  
tention that you have given it, and when we have any-  
thing to do in that line of business, we will surely give you  
a call. Very respectfully,  
J. T. WATKINS & CO.

SCIENTIFIC PRESS.—As the old year is drawing to a close  
and the new is rapidly approaching, all our friends  
should subscribe for this scientific journal, espe-  
cially devoted to their interests. It is a California enter-  
prise, and compares favorably with similar organs of  
years more experience and age in the old countries.—  
*Colfax Enterprise*.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), includ-  
ing Chlorination Process for Gold-bearing Sulphurets,  
Arsenurets, and Gold and Silver ores generally, with 120  
Lithographic Diagrams, 1877. The most complete treat-  
ise. Published at this office. Price, \$7.50. Postage, 50  
cents extra.

Mining and Other Companies.

Persons interested in incorporated shares  
will do well to recommend the publication  
of the official notices of their companies  
in this paper, as the cheapest appropriate  
medium for the same.

Bella Union Quicksilver Mining Company.

Location of principal place of business, San Francisco,  
California. Location of works, Napa County, California.  
Notice.—There are delinquent upon the following de-  
scribed stock, on account of assessment No 2 (2), lev-  
ied on the twenty-eighth day of June, 1877, the several  
amounts set opposite the names of the respective share-  
holders, as follows:

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,  
—Also—

Hammered Iron of Every Description and Size.  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. OFFICE: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

HENRY S. SMITH

**ÆTNA IRON WORKS,**

MANUFACTURERS OF

**IRON CASTINGS**

and **MACHINERY**

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

**THE RISDON**

**Iron and Locomotive Works,**

INCORPORATED.....APRIL 30, 1868  
CAPITAL.....\$1,000,000.

LOCATION OF WORKS:

Corner of Beale and Howard Streets,

SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour  
Mill Machinery, Steam Boilers (Marine, Locomotive and  
Stationary), Marine Engines (High and Low Pressure),  
All kinds of light and heavy Castings at lowest prices.  
Cams and Tappets, with chilled faces, guaranteed 40 per  
cent. more durable than ordinary iron.

Directors:

Joseph Moore, Jesse Holladay, C. E. McLane,  
Wm. Norris, Wm. H. Taylor, J. B. Haggin,  
James D. Walker.

WM. H. TAYLOR.....President  
JOSEPH MOORE.....Vice-President and Superintendent  
LEWIS R. MEAD.....Secretary

**SHEET IRON PIPE.**

**Risdon Iron and Locomotive Works**

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

**PHELPS  
MANUFACTURING COMPANY,**

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

**SACRAMENTO BOILER WORKS,**

37 Fremont St., cor. Mission, S. F.

**HALL & KELSHAW,**

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Olders, Bridges  
and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.  
Repairing promptly attended to at the  
lowest possible terms.

**California Machine Works,**

119 BEALE STREET, SAN FRANCISCO.

**BIRCH, ARGALL & CO.,**

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORKS,  
And General Machinists.

**HAWKINS & CANTRELL,  
MACHINE WORKS,**

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE

**Hoisting Engines,**

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery

**PACIFIC IRON WORKS,**

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

**RANKIN, BRAYTON & CO.,**

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

**THOMPSON BROTHERS,  
EUREKA FOUNDRY,**

Light and Heavy Castings of Every De-  
scription Manufactured.

Sole Proprietors and Manufacturers of

**Lynch's Ventilating and Illuminating Tile,**  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

**CALIFORNIA BRASS FOUNDRY,**

No. 125 First Street, Opposite Minna,

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cocks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Cou-  
plings and Connections of all sizes and patterns, furnished  
with dispatch. PRICES MODERATE. J. H. WEED. V. KINGWELL.

**GOLDEN STATE & MINERS' IRON WORKS.**

Manufacture Iron Castings and Machinery  
of all kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

**STEAM ENGINES AND BOILERS**

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

**McAFEE, SPIERS & CO.,**

BOILER MAKERS AND

GENERAL MACHINISTS,

Howard between Fremont and Beale Sts., San Francisco.

**Machinery.**

THE

**LANE & BODLEY COMPANY,**

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

**BRUCKNER'S PATENT  
REVOLVING FURNACE,**

For Chloridizing, Desulphurizing and  
Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEAR-  
ING AND MINING MACHINERY.

Send for our Illustrated catalogue.

**BAKER'S  
ROTARY PRESSURE BLOWER  
(FORCED BLAST.)**

WARRANTED SUPERIOR TO ANY OTHER  
J. C. SENDERLING, Sole Ag't Pacific Coast,  
51 Fremont Street, S. F.

**The Ingersoll Rock Drill**

Is Extensively Used in the East and

**TAKES THE PLACE OF ALL OTHERS.**  
Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other Drill in the market. It has but few parts, is easily  
handled, being light, and has a **WATER-PROOF** FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,  
320 Sansome Street,

(Room 10.)

**The Gardner Automatic Governor.**

When all others fail, buy a "Gardner." We have  
all sizes of these celebrated Steam Governors on hand  
at all times.

**BERRY & PLACE,**  
Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

**DRILL PRESS.**  
From New Patterns.

NEW IMPROVEMENTS  
STRONG AND POWERFUL.

Cost One-third Less than  
any Drill in the Market.

SEND FOR CIRCULAR.

**HAMILTON, OHIO.**

**THE O'HARRA  
CHLORIDIZING FURNACE**

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2 1/2 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61 1/2

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

## TULLOCH'S AUTOMATIC ORE FEEDER,

'Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness.

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Summer mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Strike companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 413 California Street, S. F.

## ASBESTOS COATING

For Steam Boilers, Pipes, etc. Best non-conductor of heat in use. It effects a LARGE SAVING OF FUEL, LASTS AS LONG AS THE IRON to which it is applied, and is reasonable in cost.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

### Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be

lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

### Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

### Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

APPRECIATION ABROAD.—We copy the following from the *Mining and Monetary Gazette*, of London, England: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of *The Gazette*, the full text of the 'United States Mining Laws and Instructions, by the Commissioner of General Land Office,' taken from our talented contemporary, THE MINING AND SCIENTIFIC PRESS, of San Francisco. The documents have now been issued in a handsomely bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very useful to those already interested in American mines, and to others who may be tempted to embark in that enterprise in the States."

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

SAMPLE COPIES.—Occasionally we send extra copies of this paper to those we believe would be benefited by subscribing for it themselves, or who are willing to hand the paper and speak of its merits to others. We call the attention of such to our prospectus and terms of subscription.

All Persons in Delicate Health who need a laxative, corrective, anti-febrile or anti-bilious medicine, are advised to use Tarrant's Effervescent Seltzer Aperient, and for this reason: it removes all acrid matter from the bowels and regulates the secretions and exertions, without impairing the strength. Sold by druggists everywhere.

VOLUME XXXV.  
Number 9.

## Bridge Construction.

The subject of bridge building has of late received a great deal of attention, not only from engineers who have to design bridges, but also from the general public who use them. This is as it should be. Certainly structures which bear such precious burdens of human beings and valuable property as bridges do, should be constructed with all the safeguards made known by experience and the study of the strength of materials.

With a view to extending knowledge on this important subject, we have had the accompanying cuts made by our engraver from drawings kindly loaned to us by the Pacific Bridge Company, of this city. It is claimed that the Sprague & Patterson Howe truss combination bridge possesses the qualities of lightness and cheapness to the greatest degree consistent with safety and durability, the rule in its construction being to use a factor of safety of five; or, in other words, to make the bridge strong enough to bear five times the weight which is likely to be put upon it.

The pedestal, which is shown in detail, receives the ends of the main braces, and supports the strain of the bridge. It, in turn, rests upon rollers, which play in a groove in an iron plate, thus allowing for the expansion and contraction of the bridge under changes of temperature. For a bridge of 150-ft. span and 16-ft. roadway, using Oregon pine, the main braces at the ends of the bridge measure 8x10 inches; the second, 7x9 inches; third, 7x7 inches; fourth, 6x7 inches; and so on, decreasing in size toward the center. The counter braces are all 4x8 inches; floor timbers, 6x14 inches; joists, 3x12 inches; flooring, 3 or 4 inches thick; bulkhead, 2x12 inches.

The top chords are composed of two pieces 6x12, and one piece 8x12; packing 22 inches wide, keyed and bolted by four 3-inch bolts in each panel. Great care is taken that wood shall not abut against wood in such a way as to hold water and promote decay. The top chord, when finished, is covered from the weather, as shown in the small cut, but this does not interfere with the adjustment of the bridge in all of its parts at any time. All the joints of iron are made of cast-iron angle blocks, and thoroughly painted to protect them from rust. The suspension rods, two in number on each side of each panel, as shown in the cut of the lower connection, vary in diameter from one inch at the center of the bridge to two inches on the end panel. The lateral rods, running diagonally from side to side under the floor, are 3/4 of an inch in diameter. Owing to the peculiar manner of attaching the floor beams, the lateral rods can be extended to the outside of the chord, thereby increasing their length about four feet, and giving greatly increased resistance to lateral motion.

The lower-chord bars on each side vary from four bars four inches by three-quarters in the center panel, to two bars four inches by one-half in the end panel.

Any of the braces can be removed and replaced without stopping travel on the bridge. If repairs are needed on the abutments, two men can prepare the bridge for such work in half a day.

Two 12x12 timbers are placed perpendicularly

under the first set of floor timbers from the end; the nuts on the suspension bars are loosened, letting the weight of the bridge fall upon the second pair of braces and the temporary supports above referred to. The main braces and first panel can then be removed, the lower chords of that panel turned up out of the way, and abundant room gained for the use of a pile-driver, if necessary.

In a bridge of 150-ft. span the panels are 15

CHORD COVERING

ANGLE BLOCK

LOWER CONNECTION

PEDESTAL

feet long. As our limited space enables us to give only a few panels, while maintaining the size sufficiently to show the details of construction, our cut does not give a true idea of the fine proportions of the structure.

The above description will apply, in the main, to a bridge erected in 1876 for the Supervisors of Mendocino county, on the stage road from Ukiah to Cloverdale, where Russian river is

PERSONAL.—Mr. George H. Strong, of the firm of Dewey & Co., starts Thursday morning on a visit to the Eastern States. He goes as one of the California team of rifleman, who will contend for the honor of the State at the coming Creedmoor contest. It is over 20 years since Mr. S. left his home in Northampton and came to this State, and, because of close attention to business, has made but one Eastern visit during that time. He has been actively engaged in the

## Mining Accidents.

Mining accidents seem, by some strange fatality, to occur periodically, several at a time, and then we will hear of none for weeks at a time. The past week has been a singularly unfortunate one in this respect, a number of serious accidents having happened. The most disastrous was at the Belcher mine last Friday, in the bottom of the incline of the air shaft. A shift of four men was working in the bottom, engaged in sinking. The men were using a Burleigh drill, and had just commenced to put in a hole, when an explosion occurred. The names of the men in the incline at the time are Pat. Sullivan, Sam Barrett, Billy Hancock and Johnny Uglo. Barrett and Uglo were handling the drill at the time of the explosion, and being much nearer the face of the workings, were more seriously injured. The men were got out as soon as possible through the old Belcher shaft, and were carried by the other miners to the office dressing room, where their wounds were attended to. The *News* says the explosion was undoubtedly caused by the drill striking a giant powder cartridge which had failed to go off at the proper time. This is the only explanation that can be given, and is the true one, in the opinion of Foreman Marshal, as the men had no powder with them. Great care is always used to prevent any such occurrence as the one we have just recorded, but it is sometimes impossible to tell whether a blast has exploded or not. All the men engaged in this work are experienced miners. It cannot be said that the accident was the result of carelessness or ignorance. It is one of those occurrences that cannot be avoided, and against which human skill and knowledge cannot provide.

The coroner's jury, after hearing all the evidence, were unanimously of the opinion that the deceased came to death from the accidental discharge of a blast of giant powder in the incline of the Belcher mine, and that, under the circumstances no blame could be attached to any one. Both Barrett and Uglo are dead, and there are little hopes of the recovery of Sullivan.

Robert Hoar was badly bruised by a cave in the Paymaster mine at Ward, last week.

On Tuesday, Hugh Halligan, a miner, was injured by a blast in the 1600-foot level of the California mine. His injuries will probably not prove fatal, but he was badly peppered with quartz splinters all over his body, and completely covered with flesh wounds.

On Saturday, Samuel B. Banton was caught in the pan shaft of the Petaluma mill, and instantly killed. It seems that Banton was reaching over the shaft; that works the amalgamating pans, when his jumper and shirt got caught by

two set screws on the collar of the shaft. By some means his left foot got entangled in a pulley, and held him fast to the shaft, which was revolving at the rate of 160 revolutions a minute. His head hung downward, and kept striking against the large pulley of the main shaft, which is perhaps five feet below the shaft that works the pans. His death must have been instantaneous.

David Hemming, while doing some work in the Pioneer mine, Amador county, was caved on, last week, and had his hip and knee dislocated, and the end of his thigh bone fractured.

DETAILS OF BRIDGE BUILT BY THE PACIFIC BRIDGE COMPANY.

crossed at Long's ranch. As in that case redwood was used, in place of Oregon pine, the timbers were made somewhat larger. A similar bridge of 128-ft. span was built for Sonoma county over the same river at Pine Flat.

The *Virginia Enterprise* says that a man at Silver City has found a gold mine that has so much free gold in the croppings that he can't get it out himself. He wouldn't have said anything about his find had he not desired the assistance of capital in taking out and sacking up the gold.

invigorated for future effective work in his specialty.

The old Eureka mine paid its 78th and last dividend of \$2 per share, aggregating \$40,000, on the 23d ult. The present company was organized September, 1866, and up to the date of its last annual report, October, 1876, had taken from the mine \$4,480,000, and paid dividends to the amount of \$2,054,000. Since that date one dividend of \$40,000 has been paid, and with the one paid on the 23d, will aggregate a total of dividends of \$2,134,000.

## CORRESPONDENCE.

### Lake Tahoe, the Loch Lomond of California—Its Character—Its Uses.

(Written for the Press by J. W. A. WRIGHT.)

My work for the PRESS in parts of Nevada and Placer counties has recently taken me to that truly splendid body of fresh water, known now as Lake Tahoe, and formerly as Lake Bigler. Perhaps a sketch may be acceptable to your numerous readers, giving some features and interests of that "Big Water"—as the Indian name is admitted to mean—and its prospects, much discussed of late, as a source of unfailing supply of water for at least two of the chief cities, and some of the richest mining regions of California.

Pleasant personal experience has proved to me that Lake Tahoe may, with truth, be called the Loch Lomond of California.

#### Loch Lomond.

April 20th, 1876—a day of bright sunshine, varied by a light shower from a few fleecy clouds which floated quietly by—some 80 or more delegates of the Co-operative Congress of Great Britain, who, for three days previous, at Glasgow, Scotland, had worked hard in their eighth busy and useful session, enjoyed a steam-boat excursion on that most noted of the Scottish lakes, the writer of this sketch accompanying them, by kind invitation, as their guest. On an early morning train we went over that most picturesque route from Glasgow to Balloch, 20 miles. Thence a cosy, Clyde-built steamer bore us over the lake to Rowardennan, at the base of old Ben Lomond—Scotland's most celebrated mountain peak—whose summit, then clad with snow, is reached from this place by a walk or ride of four miles. We next went to Inversnaid, the farthest point on the lake, opposite Balloch, and 21 miles distant. Half way between Rowardennan and Inversnaid we saw distinctly, in that clear atmosphere, "Rob Roy's prison," a rocky cave, of universal interest to tourists. Near Inversnaid are some beautiful falls noted as the scene of Wordsworth's charming poem—"The Highland Girl."

Our truly social party, having enjoyed to the full the wild beauty of these scenes with their pleasing associations in history, poetry, romance, and the novelty of the occasion itself, shared a well-spread lunch and after-dinner speeches, and reached Balloch, on our return trip, before nightfall. The scenes and faces of new friends, made familiar that day, will remain photographed forever on the memory of at least one of that party of co-operators.

#### Lake Tahoe.

July 4th, 1877.—To enjoy a quiet, cool, calm, restful celebration of our national birthday—business having brought me near one of the most fascinating and picturesque regions of our "New World"—after helping to "celebrate" at Placerville, in '75, by a hard but pleasant day's work, and after sharing with many thousands the grand but decidedly heated enjoyment of the World's Celebration, last year, in and around Independence square, Philadelphia, this thought was uppermost.

Is there any happier, better way for one to keep the day which every lover of liberty should always cherish, than to take an uneventful sail on the placid waters of Lake Tahoe, peering into its deep, blue waters; basking in its bright sunshine; breathing its pure, light, invigorating air; gazing at a hundred distant, towering mountain peaks; the whole day long drinking in, until it should become, as it were, a part of one's being, the true grandeur and beauty of its varied, odd, enchanting, almost mysterious scenery and surroundings—thus living, for a day at least, in seclusion from the busy world of action, and in converse with the domains of Nature?

Soon after sunrise, on this Fourth, a stage load of us, animated by some such thoughts, and bent on recreation, left Truckee, the nearest point on the Central Pacific railroad, some 14 miles from either Tahoe City or Hot Springs, on the shores of the lake. Rapidly we made our way up the wild valley of Truckee river to the former place, where this river, so noted for its clear, dashing waters and unsurpassed trout and trout fishing, forms the only outlet of that vast body of fresh water, which nestles among the Sierra Nevada at a height of more than 6,000 feet above the level of the Pacific ocean. By 9 a. m. some 15 or 20 passengers boarded the pleasure *Gor. Stanford*, and, with flags gaily flying, the tour around the lake and observations began, which are the occasion of the present description and items.

Between 5 and 6 p. m. this

#### Inland Voyage

Around and across the lake was completed by touching at or passing the following points in succession from Tahoe City on the north shore back to the same place, going from west to east: First, eight miles out, McKinney's, on the western shore; second, 10 miles further, Emerald bay, passing, on the way, Sugar Pine Point and Rubicon Point; third, four miles to a point familiarly called Yank's, though its name, as a post-office, is Tellac; fourth, four miles again

to Rowland's, which, with the preceding landing, is on the southern shore of the lake and in the lower part of Lake valley, a fine grazing and hunting region, extending back some 14 miles and as much as six miles wide in places; fifth, 14 miles to Glenbrook, an important lumber town, about 16 miles from Carson City—the capital of Nevada, our silver State—and connected with it by stage; thence 22 miles directly across the lake to Tahoe City again. This round trip being completed, the little steamer finished its day's work by a run of 12 miles to Hot Springs, or, as it is sometimes called,

#### Carnelian Warm Springs.

Where it lies at a good wharf for the night, ready to start on its daily round at 7 o'clock next morning. This affords an opportunity, for those who wish it, to stop over night or longer at one of the most noted and, in every way, most pleasant places of resort on the lake, where Mr. Wm. B. Campbell, the proprietor, furnishes the best of quarters, fare, fish, boats and fishing tackle. The warm baths, cooled down from the natural temperature of his noted sulphur springs, which give the name to his place, are truly luxurious, refreshing and healthful, and cannot be had anywhere else around the lake, though there is a soda spring near Tellac. The natural temperature of one of these springs is about 120°, another 200° Fahr. On the way to this most attractive resort, you pass Observatory Point, where Mr. Lick once proposed to place his great telescope; and farther in, to the left, are Carnelian and Agate bays, so called from the small and sometimes very beautiful

#### Specimens of Chalcedony

Found along the beach in large quantities, especially after heavy wind storms. Near Hot Springs is Boundary Point, over which the line between Nevada and California passes, marked here by one monument of granite, another of iron. Those who can spare a week or more, should, by all means, divide their time between this place and the others mentioned, for each point has its specialties and attractions. Mr. Bailey, at Tahoe City; Mr. Clement, at Yanks, and Mr. Rowland, at his place, do everything in their power to secure the comfort and enjoyment of their guests. A stage runs between Hot Springs and Truckee. The fares and charges about the lake are not exorbitant, when we consider the short season and difficult transportation at an altitude of nearly a mile and a quarter above the sea.

The Fourth of July excursion in question was thoroughly enjoyed by all who shared it, coming fully up to expectation, with a few additions. By mid-day some clouds gathered rather ominously and a brisk breeze sprang up, so that when the steamer left Glenbrook, we experienced, on a small scale, some of those bewitching "chop-seas," for which the Straits of Dover and San Francisco bay are noted at times. The boat being small, the passengers soon found that they needed all the "sea-legs" and sea-digestion they could command. Some of our number having but a small stock of either, it was not long before the aforesaid, "peering into the deep, blue waters," was accompanied by slight convulsions and nphaevals—not, however, so destructive to life or lasting in their effects as those geological ones which placed the Sierras where they are, and made for Lake Tahoe its place in nature. Under such circumstances, it is distressing to hear a man exclaim, "Oh! my conscience!"—as if his conscience hurt him—while he rushes to the side of the boat and hangs resignedly over the railing. But, fortunately, on this lake it is not long before his conscience is clear again, and he is none the worse for it.

#### Lakes Tahoe and Lomond Compared.

With the scenery of Loch Lomond fresh in memory, your correspondent could but be impressed at once with many points of similarity in Lake Tahoe. The general outlines of the shores, the contours and arrangement of surrounding mountains and several other objects of interest are wonderfully alike.

There are the same bare granite mountain sides and peaks, overspread in places with similar patches of snow. Tahoe is, perhaps, the more heavily timbered near its shores. Lomond is 21 miles long; Tahoe 22, though the latter has some advantage in width, varying from 10 to 15 miles. Tahoe City is the Balloch; Yank's or Rowland's, the Rowardennan; Mount Tellac, the Ben Lomond; Glenbrook, the Inversnaid; and the Cavern, in Cave rock, is the Rob Roy's prison, of Lake Tahoe. These points all follow in the same order, and correspond very well in distances. From Yank's or Rowland's you make the ascent of Mount Tellac, some 3,400 feet above the lake, and from its dizzy height have one of the finest views on our continent, comprising 36 lakes in sight.

From Rowardennan you ascend Ben Lomond, 3,192 feet high, and from its summit have one of the finest views in Europe, including many lakes, or lochs, as our Scotch friends would call them. From Lake Tahoe, a beautiful stream flows into Emerald bay, forming a fine waterfall some 250 feet high, which, though not coming in the same order, supplies the place of the falls near Inversnaid. As the steamer passes the mouth of Emerald bay, you distinctly see the crystal water of these falls, several miles away, glistening in the sunlight, the whole effect of the scene being one of entrancing beauty.

Other points of similarity, are the same transparency of atmosphere, and the wonderful clearness of the waters of each lake, the bottom near the shore and bright objects and fish being distinctly seen at depths

of 40 and 50 feet, or even more, when the water is perfectly calm. The waters of Tahoe never become at all muddy, which I believe is also true of Loch Lomond.

With but little effort of imagination, then, we can see in Lake Tahoe a counterpart of Scotland's famous lake.

#### Other Points of Interest.

The depth of Tahoe is very great. Until recently no deeper sounding had been made than some 1,600 feet, but Capt. Lapham, commanding our steamer, informed us that Prof. Le Conte's deepest sounding gave the immense depth of 2,700 feet, off Rubicon Point, a bold, precipitous cliff. It seems strange that, as your boat passes over such a vast expanse of water, you may draw a bucket full from any point, and the water is perfectly clear and pure and deliciously cool. Dr. Blake recently showed, in a paper read before the San Francisco Academy of Sciences, that its surface temperature is 62°, while at a depth of 560 feet it is about 39°. The air is delightfully cool most of the 24 hours, the mercury indicating 76° as usually the highest in July. The winters are often severely cold, but the lake never freezes, though the whole surrounding country is covered with deep snow. It is a remarkable fact, whatever may be the cause, that the bodies of persons drowned there—and quite a number of such instances have occurred—have never been found. This is supposed to account in part for the superstitious awe with which the neighboring Indians regard this "Big Water." It is with the greatest difficulty that any of them can be persuaded to go upon the lake in any kind of boat. In a few instances, where they have been induced to go on board a steamboat, they have invariably thrown themselves on their faces and remained in that position till the voyage was ended. The reason they give for this terror is

#### An Indian Tradition.

That many, many moons ago, when their ancestors first came to that lake, many of them tried to cross on rafts and boats, and never were seen or heard of afterwards. To one looking out upon the usually placid surface of this grand lake, where a little steamer—or, occasionally, a schooner's white sails—may be seen once or twice a day, there is a mysterious silence, an impressive stillness and solitude, well calculated to inspire awe—a feature faithfully expressed in the accompanying engraving from the fine painting of Thomas Moran. His view is between Glenbrook and Rowland's, looking south and west. To the left of the boat, Cave rock is seen projecting slightly into the lake. The cavern, 100 feet or more above the lake, is only about 30 feet in depth. Near Glenbrook, Shakespeare rock gives an excellent profile of the great dramatist. There are in all four steamboats on the lake—the *Niagara*, a fast little propeller, being used for excursions in calm weather, and towing a large passenger barge called the *Palace*; also, two others employed in towing rafts of logs from different points to Glenbrook, where four saw mills turn out between 20,000,000 and 30,000,000 feet of lumber annually for Carson and Virginia City. A narrow-gauge railroad, eight miles long, takes the lumber to the summit of a ridge, 2,000 feet above the lake, whence it is conveyed, by a V-flume, 21 miles to Carson, 4,000 feet lower than said summit. The color of this mass of extremely pure water of Lake Tahoe is one of its most striking features. It varies from an indigo-blue, when very deep, to a light green, where it is shallow. The line dividing these colors is marked with wonderful distinctness as you leave Rowland's to go north. You see it from quite a distance, and pass, all at once, from the green to the blue, so sudden is the change to the deepest water.

#### Animal Life.

The scarcity of water fowl was surprising. Only two or three white gulls were seen on the eastern shore. Not a duck or wild goose or swan appeared; not a grebe, or "mud-hen," such as those that abound on Owen's lake. None of the queer worms are found which I described, in a former paper, as so plentiful in the surf of the latter lake. At least four, possibly six, kinds of fish abound in Lake Tahoe—the silver trout, black trout, white fish, a sucker, a chub, and a minnow, used for bait, the latter probably differing as much from the larger kinds as the brook minnow does from other fish in our streams. A harmless spotted water-snake is quite plentiful, but no venomous reptiles have been found in or near the lake.

Mention has already been made of

#### The Carnelians.

Found only along the bay of that name and Agate bay. A curious opinion prevails with some of the old settlers as to the formation of these very pretty minerals, as there found. It may be worth recording and thinking of, whether the theory is correct or not. It is, that these carnelians are a species of fossil resin from the pines around the lake, just as the amber, tossed upon the shores of the Baltic, is known to be of resinous origin, as is proved by the insects sometimes imbedded within it. The idea is, to say the least; ingenious and may deserve further investigation. Our party certainly found pieces of resin still soft which were washed up with the hard carnelians, while some of the latter, hard as any pebble, had very much the shape and appearance of fossilized resin, but we looked in vain for imbedded insects. However this may be in regard to some of these so-called carnelians, there is hardly a doubt that many, if not all of them, are a very pure form

of the well-known mineral, chalcedony.

#### Prospective Uses of Tahoe Water.

It remains to discuss briefly the future value of Lake Tahoe for certain city and mining interests of California.

Could a feasible plan—say Col. Von Schmidt's or any other—be worked out without extravagant outlay, without more watering of stock than the lake water itself would do, without any of those notorious tricks in management which have given our people in town and country a mortal dread of moneyed corporations, and almost totally destroyed their confidence in all enterprises where a large fund is required—so that this inexhaustible source of some of the purest water in the world, literally fed by eternal snows, could hereafter supply the wants of San Francisco, Oakland, Sacramento, and the gravel mines of a large part of Placer county, it would indeed be a God-send to millions of the future population of the Golden State.

Those interested in the fullest prosperity of California cannot examine the extent of Lake Tahoe and enjoy the refreshing draughts of its splendid water, without wishing this result could be consummated at the earliest possible date. Who can doubt, that by the end of this century, less than 23 years hence, the first two cities named will (combined at least) have half a million people with their varied wants to supply, while Sacramento will have grown greatly, and other places in proportion. Recent visits to the mining regions of Placer county have shown me that its two great "divides" of Forest Hill and Iowa Hill, extending up as high as Michigan Bluff, Sunny South, and Last Chance, perhaps even higher, comprise some of the richest deposits of gold in the State, to say nothing of the other valuable minerals, including the finest asbestos. One can but be impressed with the belief, after examining the mining prospects of this and Nevada county, and other mining districts of the Sierras, that a thousand years from this, California will still be furnishing the precious metals and others in abundance, if its people need them in those days. But the pressing want to develop these valuable resources, is just what the interests of agriculture and temperance need in our State, viz.,

#### Plenty of Water.

An examination of the many valuable hydraulic mines around the places named, also about Todd's Valley, Bath, Smith's Point, Yankee Jim's, Damascus, and other places lately prospected, proves how lamentable are the effects of the absence of water, such a dry year as this has been. To my surprise, I find that many have not had enough water to work their mines more than two weeks, others only about a month altogether, the past season. All these points are but 3,000 or 4,000 feet above the sea level, so that the fall from the lake is ample, when the necessary tunnel is once made. Why cannot the interests of our larger cities, and these rich mining districts, and some of our agricultural interests along the route, be judiciously combined, and so managed as to furnish all these wants with an inexhaustible supply of the best of water for all these purposes? Shall the fear of "crooked" management prevent? Must we have the humiliation to admit that, with all our boasted institutions, good laws, the sagacity, inventive genius, and integrity of our people, we cannot have such legislation and control as will work out any such enterprise for our people, or our Government, to a successful and honest result? For the sake of American honor, business tact, and statesmanship, we trust not.

#### Valuable Mines.

While the mass of mines in Placer need this supply of water, some, it is true, do not. Such are, the noted Weske mine, along El Dorado canyon; a new quartz lead, located by Mr. Durning and others, near Yankee Jim's; and, last but not least, Bell's rich and very wonderful mine of decomposed quartz, near Bald hill, four miles northwest of Auburn. The Weske mine is troubled, just now, with too much water. Their tunnel having been completed some 4,000 feet, this mine is remarkable, above all others, by having a steam engine in one of its large chambers, 3,800 feet under ground. It is used to pump out the surplus water.

The local newspaper reports of the rich yield of Mr. Bell's new mine, near Auburn, have by no means been exaggerated. It was discovered by him the latter part of February last by systematic prospecting and tracing, which it is interesting and instructive to hear him explain, while going over the ground. With his pan, he followed up the wagon ruts and small gullies in an old road after a winter's rain, till he found the outcropping rock from which the exceedingly rich deposits have been taken. It began to pay well from the surface. Early in June he had sunk his shaft 40 feet, and since March 1st had taken out somewhere between \$25,000 and \$35,000. This was done chiefly with pick and pan, a single panful of the decomposed rock yielding at times from \$1,000 to \$2,000. When I visited the mine, he was retimbering the shaft and preparing to go deeper. Descending the shaft with him, I saw him take out a panful of rock and clay from the side of the shaft, some 35 feet down, where the ledge is nearly four feet wide. I saw him wash out this panful with no extra care, and when he finished, the result of about 10 minutes' work was some \$25 or \$30 in coarse gold, several lumps of which were worth \$2 or \$3 each. Most of this gold is very pure and of laminated form, the intervals between the folds being often filled by a sub-

Continued on page 134

## MECHANICAL PROGRESS.

## A Cotton-Picking Machine.

If the complex operations needed in cotton picking are successfully performed by mechanism, it would seem that the inventor need shrink from no problem. According to *Legg's Milling News*, the cotton picker has been patented and the following gives an idea of the machine and its task: Cotton plants vary in height from one foot to seven, and are planted in rows at various distances apart, but averaging about three and a half feet. The pods mature at varying times, and when they open, the cotton gradually unfolds itself and hangs down more and more, until, if not picked, it is finally shaken out by the wind, and falls on the ground. The picking season extends usually from the latter part of August to the first of December. From the knowledge of these facts some idea can be formed of the difficulties to be overcome before cotton can be successfully picked by machinery.

We now learn that an apparatus has been constructed and experimented with which promises to fulfill the requisite conditions. It is the invention of Mr. O. R. Smith, of Raleigh, N. C., and was patented April 10th, 1877. It consists of a frame, mounted on three wheels, and spanning two rows of plants, the single front wheel running between the rows, the rear wheels outside. The rear wheels are quite large, so as to carry the framework over the highest plants; the front wheel is much smaller, and works under the machine on a pivot joint, to which the horses are attached.

The picking is done by a series of flexible rubber rods, boarded with fine spines pointing upward, which work alternately up and down through the plants as the machine advances. These rods are fastened to levers, which vibrate alternately, so that as one rod is moving up the next is going down. The cotton adheres to the spines, and is stripped from the bolls on the up-stroke; and on the down-stroke the adjacent rods pick off the cotton from the spines and carry it upward until it is removed at the top by brushes, as from the saws of the cotton gin. An endless apron then carries it into a receptacle at the rear, from which it is removed when sufficient has collected.

These picker rods—of which there are about 200—are just sufficiently flexible to clear themselves from stalks or stumps, and do not, it is stated, injure the plants. The spines with which they are covered will not take hold of leaves or twigs, as nothing but the cotton will adhere to them, and they pick all that is opened, whether on the ground or at the top of the plant. The machine costs \$300, and is estimated to pick the cotton at an expense of one dollar per bale, a great saving over hand labor.

**MACHINE BELTING.**—A specimen of gigantic machine belting, produced from the skin of the walrus or sea-horse, has recently been exhibited in London by the manufacturer, and excited much attention and interest. It is stated, in fact, says the *American Manufacturer*, that this belting cannot be equalled by any yet introduced for strength and durability in case of heavy work, when used upon large drums, such as main driving, and similar requirements. The thickness of the walrus hide is from one-half to one and a quarter inch, so that belts of such substance can be made of solid leather; and the fibers thereof being longer than any other hide used in the making, it presents the valuable advantage of being remarkably tough, and consequently very lasting. The employment of this material in the way named is, of course, not a new resort, but its importance has been only slightly realized. It is well known that, in ordinary double belting, a great strain takes place on the outside lap of the belt, which, of course, owing, of course, to its being of one thickness only; cannot be the case with the walrus-hide belt, it is remarked, moreover, that they run very slack, and do not require to be worked very tight, as some belts do. Indeed, such is the light on the drum, that a 14-inch belt, 90 feet long, will drive 100 horse power with ease.

**A BATHING CAR.**—An exchange says: "The Turkish bath will be introduced on railroad trains. Charles H. Cooper, of Watertown, N. Y., has patented a car for this purpose. The internal arrangement is a parlor or drawing-room, 10 by 15 feet; Russian and plunge bath, 8 by 7½; three shampooing rooms, 6 by 7½; tepidarium, 10 by 23; movable closets, 2½ by 10; passages 18 inches wide. The temperature in the various rooms will vary from 80° to 160°. The whole is lighted by blue glass. The idea of the inventor is that the car may be used on trains or side-tracked at towns where no such establishments are in operation. The entire process of the Turkish bath is to be practiced—from the hot room to the shower bath, plunge and cooling down."

**MUSICAL MACHINERY.**—The average annual value of musical instruments made in Paris during the last six years has been 23,000,000*f.*, divided among 360 makers, employing no fewer than 5,000 workmen. Paris turns out every year 1,320,000 francs' worth of accordions. Pianos figure for 11,400,000*f.*; organs for nearly 5,500,000*f.*; wind, wood, and metal instruments for nearly 4,000,000*f.*; but bowed instruments for less than 500,000*f.*

**FIRING UNDER WATER.**—Major-General Von Uchatius, the inventor of the new field gun adopted in the Austrian army, has made some interesting experiments with the object of ascertaining the effect produced by firing a rifle under water. It is known, he says, that fishes, when they are not too much below the surface of the water, can be shot from the shore or from a boat. The armor-plates of ships of war, however, do not usually extend any lower than from two to three meters below the surface, as beyond that depth ships are regarded as unsalvageable even by the largest shot. This is so, no doubt, when the shot is fired above water; but Major-General Von Uchatius wished to find the result which would be attained by firing under water; for this purpose he procured a wooden raft, to the under surface of which a Werndl rifle was attached with iron clamps in such a manner that when the raft floated on the water the rifle was fired horizontally at a depth of half a meter below the surface. An attendant then opened the lock, introduced a cartridge, placed the rifle at full-cock, and fired it from the shore by means of a string attached to the trigger. The target consisted of a wooden board an inch thick. The result of the experiment was as follows: There was no difficulty in loading and firing the rifle, and there was the advantage that after each shot the inside of the barrel was cleaned by the water. About thirty shots were fired without doing the smallest damage to any part of the rifle. At each shot there was a dull sound, which could not be heard beyond a distance of fifty paces, and bubbles of smoke rose above the surface. At a distance of one and a half meters no impression whatever was produced on the target; at one and a quarter meters the bullet entered to a depth of from three to four millimeters, and at one meter the target was pierced through.

**THE PERILS OF THE FOUNDRY.**—Few appreciate the dangers which the brave mechanics face, or give them proper credit for bravery. We read of an accident in Pittsburg, Pa., which was as follows: A number of men were casting a chilled roll. Nearly two tons of iron were required to make the casting, and the services of 20 men were required to handle it. While they were pouring the molten metal into the mold there was a sudden and terrific report, which was closely followed by a shower of liquid iron. The red-hot metal flew in every direction and dropped upon and about the workmen. They ran to escape the shower, in their terror dropping the ladle which yet contained most of the metal. The ladle was overturned and immediately great streams shot out in quick pursuit of the flying laborers. Two of the workmen, closely followed by streams of the red-hot iron, fell into adjoining pits and the metal ran in upon them, burning their flesh to a crisp in many places. One man's face was burned to a crisp and his eyes burnt out of his head, and in their places the sockets were filled with chunks of chilled metal. That man was George L. Elbert, of Allegheny. Walter Mbran's eyes, too, were burnt from the sockets, and his face, breast, arms and hands were burnt to a crisp at different places. Here and there the red-hot metal had actually eaten its way to his bones. Mr. Totten was interrogated as to the cause of the explosion, and he attributed it to a "damp cave." In other words, the sand with which the mold had been packed was not properly dried, and perhaps, too, not properly grooved, so that the steam generated could not escape.

**AN IMMENSE CONTRACT.**—We read in the *Polytechnic Review* that the largest single contract ever taken in this country from a foreign nation is the \$17,000,000 one given to the Providence Tool Company by the Turkish Government. The Tool Company was three years in preparing to begin the work upon the contract, and now employ 2,500 men, who turn out 200,000 guns per year, or 600 finished guns in a day. These guns are the Martini Henry rifles. One of the side businesses of magnitude which has grown principally out of this contract is that of the Excelsior Box Company, of Providence, of which James A. L. Amoreux, of this city and South Hadley Falls, is treasurer. The Excelsior Box Company is now busy making 20,000 boxes per year for the Tool Company, in which to ship their guns to Turkey. Each box is made to hold 20 of the guns, and with such accuracy are the groove pieces for the interior of the boxes made, that they do not allow a play of even 1-200 part of an inch of the arms, when packed with the muzzle-tip and shoulder-piece resting in the grooves. No other precaution is needed or used in packing the guns for shipment to Turkey. The machinery for the manufacture of these boxes was perfected in an invention for the purpose. The company has still two years in which to complete the number of these boxes that they contracted to make; by which time, also, the Tool Company will have completed their immense contract with the Turkish Government.

**CASTING BABBIT BEARINGS.**—The Keystone Portable Forge Co. kindly gives the *Polytechnic* some points relative to its successful practice with Babbitt metal bearings. The first usage was to run the bearing on a highly finished steel mandrel of the exact size of the shaft, and then to ram the bearing out a trifle to make a running fit. The present and improved practice is to run the box on a mandrel a size larger than the shaft, and not to ram. By this means the skin of the Babbitt casting is not disturbed, and the bearing runs cooler and longer.

## SCIENTIFIC PROGRESS.

## Camping on the Pole.

Mention has before been made of Captain Howgate's project to establish a colony in the extreme regions of the north, and to maintain it until desirable facts are ascertained about the polar regions. This expedition was announced to sail from New London, Conn., a few days ago. The expedition is aboard the little schooner *Florence*, manned by ten seamen, under the command of Captain Tyson, who had the *Polaris* in charge when it was cast upon the ice drifts three years ago.

Captain Howgate, who originated this expedition and has managed the affairs of its preparation, is an officer of the Signal Corps of the army, second in command to General Meyers, "Old Probabilities." He has the immediate charge of the Signal Service, managing its details, while General Meyers has a general supervision. Captain Howgate is a man of middle age, quiet in his manners, and very modest. His whole life has been spent in science—meteorological science especially. For nearly four years he has been devoting his leisure to the study of the subject, and the scheme he has matured and projected is to found a colony at the most accessible point in the Arctic regions, which may be the base of supplies, and the center of a grand system of exploration. He proposes to establish a colony where the men engaged in the work can acclimate themselves by actual residence to the hardships of Arctic life; from which they can penetrate the ice wilderness by easy stages, and to which they can retreat when they become disabled or their supplies give out. In this scheme he has received the encouragement of the entire scientific world, but has had to face many discouragements and difficulties in bringing it into practical operation.

Last year he had his plans fully formed, and asked of Congress an appropriation of \$50,000 to carry it into effect. The Naval Committee recommended it unanimously, but the attention of Congress was so engrossed by the matter was neglected. After the adjournment of Congress he appealed to individuals, and a subscription of \$10,000 was raised for him with which to start out a vessel to take the preliminary steps. Accompanying Captain Tyson, in addition to his crew of ten experienced men, are Mr. O. T. Sherman, of Providence, R. I., who goes as meteorologist and photographer. The Smithsonian Institute is represented by Mr. Ludwig Kumlien, who goes as naturalist and geologist. The expedition is furnished with all of the scientific instruments required. Different vehicles of locomotion are provided for overcoming the distance between the colony and the pole, and great confidence is placed in a combined raft and sledge which has recently been invented by Commodore Ammen, of the Navy Department.

The instructions of Captain Tyson are to erect comfortable quarters at the most feasible location, for which he has the timber all ready to be put together, choosing a point that will be easily accessible to vessels from the south, and also favorable to exploring trips to the north. He will employ a number of Esquimaux, a full supply of dogs, native sledges, and a quantity of fur clothing, such as the inhabitants of the region wear. During the summer the *Florence* will get in a cargo of bone and oil for a winter's supply, and will then return to this country, leaving the scientists encamped in the colony. By the time of her return Captain Howgate hopes to secure an appropriation from Congress with which he can equip a larger force to go as reinforcements to the colony under his personal command next summer. In the meantime the colonists will become hardened to the climate, and make such explorations as they are able.

## The Geology of British Columbia.

We notice that the geology of our northern neighbor was discussed, at a late meeting of the London Geological Society, by George Mercer Dawson, Esq., F. G. S., Assoc. R. M. S., of the Geological Survey of Canada. The author stated that the rock-striation and fluting on the southeastern peninsula of Vancouver's island shows that at one time a great glacier swept over it from north to south, filling the Strait of Georgia, 50 miles broad in places, and having near Victoria a thickness of ice of over 600 feet. Traces of this glacier also occur on San Juan island, and on the coast of the mainland. The deposits immediately overlying the glaciated rocks, besides what may be *moraine profonde*, locally developed, are sandy clays and sands, arranged in water, and sometimes containing marine shells. The lower beds, at least, of these, were probably formed at the foot of the retreating glacier, the sea standing considerably higher than at present. The northern part of the Strait of Georgia and fjords opening into it, and the fjords north of the strait, show ice-action to a height of above 3,000 feet. Terraces on the coast of the mainland are rare, and never at great elevations. The interior plateau of British Columbia shows a system of glaciation from north to south, traces of which have been observed about 3,000 feet. Subsequent glaciation radiating from the mountains also occurs. The superficial deposits here

are either modified or unmodified. The former, representing the boulder clay, occurs at nearly all heights up to over 5,000 feet; the latter characterizes nearly all localities below 3,000 feet, and is most extensively developed in the northern low country, where it forms a white silt or loess. The interior is marked with shorelines and terraces up to 5,270 feet. Moraines occur in great numbers, most of them marking stages in the retreat of glaciers towards the mountains, although some have been found in connection with the north and south glaciation. The sequence of events in the interior, according to the author, seems to have been as follows: Glaciation from north to south, with deposits of boulder clay; formation of terraces by lowering of water surfaces, accompanied or followed by a warm period; advance of glaciers from the mountains, and formation of lower terraces; and retreat of glaciers to their present limits. The glaciation of Vancouver's island may have occurred during both cold periods or during the second only. The author considers the assumption of the production of the north to south glaciation by an ice-cap to be attended with great difficulties, and seems to favor the notion of its being effected by the accumulation of ice on the country itself, and especially on the mountains to the north, filling the central plateau in going southward, and passing seaward through the gaps and fjords on the coast range.

## The Origin of Petroleum.

At a recent meeting of the Chemical Society of St. Petersburg, Professor Mendelieff sought to combat some of the old notions on the origin of petroleum, and to substitute a new theory on the subject. It has been maintained by many geologists that the decomposition of mineral matter in the lower strata of the earth was the source of petroleum.

Mendelieff believes that the true source is to be found much lower down. The sandstone in which it is found were not its original source, as is shown from the fact that no carbonized animal remains are found in it. There ought also to be other products of animal decomposition, if that was the starting point; we must search lower down, even below the Silurian, as the mineral oil in the Caucasus is found in the Tertiary, and in Pennsylvania in the Devonian and Silurian. As, however, in the rocks below the Silurian there was very little organic life, the formation of such a great quantity of petroleum could scarcely be traced to such a limited source. Mendelieff therefore proposes a substitute for the organic theory. He goes back to the nebular hypothesis of Laplace, and applies Dalton's law of the original gaseous condition of the material of the earth, and, taking into consideration the density of the earth and the vapor density of the elements, he arrives at the conclusion that the interior contains many metals, and that chief among them is iron; finally, he assumes the presence of carburetic compounds of the metals, and comes to the following conclusions: Through some of the fissures in the crust of the earth, occasioned by the upheaval and depression of the surface, water percolated to the carbureted metals, and acted upon them at high temperature and elevated pressure, thus forming metallic oxides and saturated hydrocarbons; the latter rose in the form of vapor to the upper strata, where they condensed to liquids in porous sandstones and other rocks having a tendency to absorb liquids. The internal heat of the earth occasioned the reduction of carbureted metals, and this gave rise to hydrocarbons. Other chemists than Mendelieff have shown, experimentally, that something very like petroleum can be produced artificially by imitating in the laboratory the process above described.

**SPONTANEOUS PRODUCTION OF PROTOXIDE OF IRON.**—M. Terrell, who is at the head of the laboratory attached to the Paris Academy of Sciences, has investigated the oxidized crust which he found rapidly accumulating on the surface of the iron rods of the registers of a Siemens furnace. This furnace was of a new design. It might be supposed at first that this crust consists of magnetic iron oxide, but this substance forms really only a fourth, hardly that, of the total mass. The great bulk consists of the protoxide of iron recently discovered by M. Debray, protosulphide of iron being present in the proportion of about one per cent. M. Daubree remarks that this unexpected product, so far from being accidental, is quite normal, and occurs in spite of the strong clay lining of the rods, when they are plunged into a reducing atmosphere. The latter, according to M. Gigat, contain 64 parts nitrogen, 26 carbonic oxide, 16 hydrogen, and 4 carbonic acid. The thickness of the deposit is estimated at half a millimeter a day.

**NEW STANDARD LIGHT FOR GAS TESTING.**—In his Cantor lecture on the Chemistry of Gas Manufacture, Mr. A. Vernon Harcourt, M. A., F. R. S., stated that the standard sperm candle is uncertain, variable in composition and construction of wick, and that the mode of burning and light of the same candle fluctuates greatly from time to time. He proposes as a substitute for the standard candle an air-gas, obtained by saturating air with light petroleum vapor. The gas he obtains by passing air through water with a measure of light petroleum on its surface contained in a Woulfe's bottle. The gas is to be burned in a burner of definite size and construction, the gas issuing without pressure.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**MOORE RICH QUARTZ.**—*Amador Dispatch*, Aug. 29: Mr. W. S. Dunning still continues to take out some extraordinarily rich rock from his mine, near the Motherlode claim. We were shown several pieces of rock taken out a day or two ago, which were literally studded with gold plainly visible to the naked eye. There is no longer any doubt that this mine will prove a very valuable piece of property, when fully developed and properly worked.

**KENNEDY MINE.** The further prospecting of the Kennedy mine under the superintendence of Mr. James Fleming, is bringing forth flattering results. Where he is now at work is down about 100 feet, and drifts are run over 200 feet; and we are told that the rock is of a very superior quality—the ledge being about four feet wide. Mr. Fleming is a careful and skillful manager, and we have but little doubt that the Kennedy mine will soon be running again at full blast, it he continues to be its Superintendent. We believe the mine will yet prove to be among the best mines in the county.

**STARTED UP.**—*Amador Ledger*, Aug. 18: The new hoisting works of the Potolmi mine have started up. The water has been taken out for 50 feet in the shaft. The Government has stopped running, owing to failure of the water supply. Twenty men will be idle until the commencement of the rainy season. Meantime the sinking of the new shaft is to be vigorously prosecuted.

A rumor is in circulation that the Mahoney will be shut down this week, to await the decision of the courts.

### BUTTE.

**FEATHER RIVER MINES.**—*Marysville Appeal*, Aug. 24: From George A. Duckstadter, Superintendent of the Main Feather River mining company, we learn that they have every arrangement completed to commence work next week. The machinery is in position upon the ledge, and the engines have been tested to prove their working order. All that is necessary to complete the outfit is the joining of a section to the tube or sucker. The machine will be put in operation about half a mile above the bridge at Oroville—near the foot of the mining dam of the old Cape claim. This will make three boats that are operating this river, two being owned by the California Breeding and Mining Company. The company have one of the boats with a sucker, at work three miles above Oroville (on Long's bar), and the other is working on the ground of Shaffer & Parks, two miles below the town. It is said at the latter place as high as \$45 have been taken out in one hour's run.

### CALAVERAS.

**POTTER AND RODGERS' BONANZA.**—*Calaveras Chronicle*, Aug. 25: Some of the richest quartz that was ever found in the State has lately been discovered in the Blue Jay mine, at Mosquito, owned by Messrs. Potter & Rodgers. Specimens of the ore were brought to town recently, and we are free to confess that we never saw anything approximating them in richness. Some pieces of the rock were apparently more than half gold. We learn that a small piece of the ore, weighing less than five pounds, was sold to San Francisco parties for \$250. The ledge in the Blue Jay has widened out to seven feet, and all the indications are of the most encouraging character. Work is progressing steadily, and, as developments advance, the prospect for a permanent paying mine is constantly brightening. Messrs. Potter & Rodgers deserve success for the great degree of perseverance and energy they have shown, and we are pleased to know that they are meeting a richly merited reward.

**UPPER COUNTRY JOBS.**—The Hull mill, at the Zaeetero mine, West Point, is running steadily, with good results. Work is progressing steadily, and, as developments advance, the prospect for a permanent paying mine is constantly brightening. Messrs. Potter & Rodgers deserve success for the great degree of perseverance and energy they have shown, and we are pleased to know that they are meeting a richly merited reward.

**FRESNO.** **SPECIMENS.**—*Fresno Examiner*, Aug. 25: We were shown some very fine specimens of quartz taken from the mine of A. J. Thorn. The rock was taken out at a depth of 120 feet, and shows a large amount of free gold. The rock is also rich in sulphurates. Mr. Thorn is the sole owner of one of the most promising quartz mines in the State. Several years ago he worked the mine, and over \$16,000 was extracted from it, but on account of an accident, by which he lost his arm, he was compelled to quit work, and another prospecting work on the mine failed to make it pay. Mr. Thorn intends to develop the mine and work it.

### INYO.

**MINNETTA.**—*Coso Mining News*, Aug. 25: There arrived here last Thursday, J. H. Jacobs, President of the Minnetta Belle company, in company with J. H. Jacobs, late owner of their splendid 10-stamp mill, who comes to turn over the property to the company, they having lately purchased the same. C. M. Blair will be installed as business manager of the mill, while Bedford Chase will act as mill-man and foreman. W. E. Brown, the present efficient Superintendent of the mines, will be retained. The work heretofore has been too arduous for one man, and it is anticipated that in running the mill, etc. The Minnetta will undoubtedly ship bullion during next month to the amount of \$40,000, which will be sufficient to pay off all their debt and leave a surplus on hand. The ore is now being worked in the mill at an expense of \$10 to \$11 per ton, the ore averaging \$100. The mines are looking first-rate and improving with every day's development.

**COSO CO.**—On the Bella Union they are stopping east of the lower winze and in fine ore, the average width being three feet. They are also making a new development south of the winze, which is yielding ore of a fine quality and the vein widening as they advance. The prospects in the lower workings have never been as flattering as at present. The mine will, we think, soon be in condition to produce ore in abundance.

**CURVOR.**—Ore is being hauled to the furnaces for reduction, both from the Cuervo and Promontorio mines of the company. **DEFIANCE.**—Prospects brightening with every day's work and goodly quantities of ore being extracted and loaded to the furnaces, which, under the able management of Mr. J. S. Cornat, are turning out bullion at the rate of 10 tons per day. A shipment has been made since starting of the furnaces, and teams are now being waited for to take away that on hand.

### LAKE.

**FORCE REDUCED.**—*Lower Lake Bulletin*, Aug. 20: We learn that four of the eight furnaces of the Reddington mining company have been shut down, the fine ore furnaces only being kept in operation. The force has been reduced from 275 men to 60, and quite a number of people have moved away in consequence, leaving Knoxville lifeless and dull.

### NEVADA.

**A GOOD CLEAN-UP.**—*Grass Valley Union*, Aug. 25: The last clean-up of quartz from the Centennial mine was made on the 24th inst., a day or two ago, and the result was \$2,097 from 11 loads, or \$227 per load. The Centennial company thought the rock would mill \$150 per load, and were agreeably surprised at the large increase. The mine is producing more quartz of the same kind.

**PLANET GRAVEL MINE.**—This mining company, a Grass

Valley organization, but whose property is in the vicinity of Liberty hill, and on the dividing ridge between Steep Hollow and Bear river, are very energetically engaged in driving a bedrock tunnel through to the gravel deposit. The tunnel was commenced two months ago, and is now in 224 feet. The entire distance to be run is about 500 feet, and it is believed that the work will be accomplished in six months. The Swamp Angel company, the adjoining claim, is taking out regular and profitable pay all the time, and the McCann claim, on the same channel, on the west side of Steep Hollow, is yielding very largely, being, in fact, one of the best gravel claims in the State. The Planet ground is coming into strong favor, as it is regarded as one among the most promising gravel locations in the county.

**FINE YIELD OF GOLD.**—*Nevada Transcript*, Aug. 25: We saw yesterday at Phil. Richards' banking-house, on Main street, a beautiful lot of gold from the Eagle claims at Moore's Flat, which had just been run out by J. J. Sawyer. The gold was from a run of about 13 weeks, and was valued at \$5,000. Phil. Richards has been doing a land office business during the past week. One lot of gold from the Blue Bank company, Moore's Flat, yielded \$3,340; from Hagerly & Co.'s claims, \$2,704; and from small lots, \$2,500, making a total for the week, including that from the Eagle claims, of \$18,642. Most, or about one-half, of the gold was from the vicinity of Moore's Flat. Oh, yes, the mines are all "played out."

**ANOTHER BIG BLAST.**—The Blue Tent Co. gravel mine has been using a good deal of powder this season. On Monday last another big blast was fired in the Blue Tent claim there that did splendid work. The drift was run under a bank 100 feet below the surface. It was run in 75 feet in hard cement. At the end of the parallel drift was a large pile of powder. There were 10 tons of black powder placed in the drifts, and the tunnel filled up to the mouth. The powder was ignited by electricity. The whole body of ground above the drifts and for a considerable distance beyond was raised bodily and finely pulverized. It was estimated that 200,000 tons of earth were broken and pulverized for washing by the explosion. The blast was fired by J. J. Sawyer, the chairman of the Board of Directors, who resides in London. The property is principally owned in London. The company have expended over \$200,000 in cutting a ditch to convey water to the mine, and have spent an equal amount in fitting up their claims. They own three extensive claims. They are now in a condition to reap a profit from the working of the mine. They have run bedrock drifts to get a full for waste material, and are making arrangements for other work, which, when completed, will allow them to work the claims to the greatest advantage, and with profit to the owners. They are now using 1,400 inches of water in the south Yuba claim every 12 hours, and will now be enabled to use 1,200 inches in the Blue Tent. They are going to run a tunnel in from Gopher ravine so as to wash off the top dirt and arrange so that only the rich bottom dirt will be run through the other tunnels. They will then be able to use from 3,000 to 5,000 inches of water every 12 hours. When this work is all completed there is nothing to prevent the Blue Tent company from making the annual clean-ups as large as any mine in the county.

**GOOD PROSPECTING REGION.**—*Foothill Tidings*, Aug. 25: Over in the vicinity of Rough and Ready, one of the best placer mining localities of early days, there seems to be less than attention paid to seeking quartz than the early returns in gold quartz would lead one to expect. The Kentucky Ridge, now just started at regular work of gold production, is in that region, and a short distance below is the "Ironclad," a location made on the 20th of last month by John Fippli and H. Scribner. They have put down a shaft there about 20 feet, and from about two tons of rock worked at the Larimer mill this week, taken out in sinking, gold bullion to the value of \$42 was returned. We saw the bar. They have a 16-inch ledge of milling ore, and we are told that it is better at the bottom than at any other point. Among other claims in that vicinity, which only await capital to open them up, are the "Prophet Girl," the "Hayes," the "Moore," the "Blue Bank" and the "Oro Verde." Capitalists who wish to buy, or prospectors who would like to find a gold mine, would do well to call upon either of the parties above named, who will aid them in their search with great pleasure.

### PLACER.

**DUTCH FLAT FORUM.**, Aug. 24: Mining news is scarce this week; we note nothing worthy of mention. All the claims in this section are idle for want of water, excepting the Baker claim, and this claim will make its final clean-up for the season within a few days.

### SIERRA.

**PROSPECTING.**—*Mountain Messenger*, Aug. 25: A great deal of prospecting is now being done in this county, more than for a long time past. That is what is wanted.

**NORRIS.**—The Mammoth Springs company recently found \$22-ore nugget in their claims above Allegheny. The company have been taking out \$10 per day to the man all summer.

### TUOLUMNE.

**AUTUMN BIG STRIKE.**—*Tuolumne Independent*, Aug. 25: Dan. Hennessey and Pat. King have made another big strike in their quartz lode at Saw Mill Flat. Within the last two or three weeks they have taken out several thousand dollars. On Monday of this week it was expected that they would realize a large amount, as they had been blasting the ledge away, leaving a large mass of gold in sight, which they could capture on that day.

## Nevada.

### WASHOE.

**BELCHER.**—*Gold Hill News*, Aug. 20: Sinking the air shaft is going rapidly forward. It has nearly reached the point at which the 2000-ft station is to be opened. The old shaft has reached the same level, and sinking the shaft is being continued for a pump. The ore prospects south on the 1000-ft level continue to improve as the drift progresses.

**JUSTICE.**—Daily yield, 350 tons of ore. The ore stops continue a steady yield and favorable look from the 500 down to the 800-ft level. The east drift, on the 1150-ft level, is evidently nearing the main ore vein, the quartz streaks being largely on the increase and of a very favorable character.

**SAVAGE.**—Draining the water is making better progress than for months past. The pumps have been at last made to work steadily, for the week past, in conjunction with those of Hale & Norcross, and have lowered the water 80 feet below the 1000-ft station.

**JULIA.**—The ore prospects of the east cross-cut, on the 1800-ft level, are steadily on the increase, the face of the drift showing a much more favorable character of matter.

**SILVER HILL.**—The new pump-bell and other machinery has arrived at the mine and is being placed in position.

**OPHIA.**—Sinking the joint winze on the Mexican line, below the 1700-ft level, is going steadily ahead, the bottom in good working ground.

**HALE & NORCROSS.**—The water is down 35 feet below the 1000-ft level, and is being rapidly drained by the new pumping works, in conjunction with those of the Savage.

**MEXICAN.**—The north drift on the 1000-ft level is making steady and favorable progress. Sinking the joint winze on the Ophir line is going steadily forward.

**CROWNS POINT.**—The south drift on the 2000-ft level, running to connect with the Belcher drain-shaft, is fast approaching completion.

**SAVAGE.**—Draining the water is making better progress than for months past. The pumps have been at last made to work steadily, for the week past, in conjunction with those of Hale & Norcross, and have lowered the water 80 feet below the 1000-ft station.

**JULIA.**—The ore prospects of the east cross-cut, on the 1800-ft level, are steadily on the increase, the face of the drift showing a much more favorable character of matter.

**SILVER HILL.**—The new pump-bell and other machinery has arrived at the mine and is being placed in position.

**OPHIA.**—Sinking the joint winze on the Mexican line, below the 1700-ft level, is going steadily ahead, the bottom in good working ground.

**HALE & NORCROSS.**—The water is down 35 feet below the 1000-ft level, and is being rapidly drained by the new pumping works, in conjunction with those of the Savage.

**MEXICAN.**—The north drift on the 1000-ft level is making steady and favorable progress. Sinking the joint winze on the Ophir line is going steadily forward.

on all the ore-producing levels of the mine are looking splendidly, and are yielding rich ores. The returns from the mills warrant the assertion that the monthly yield for August will exceed that of the mine for the same length of time for the past six months, and the average of bullion produced is already in excess of that for the month of July. This secures beyond a doubt the payment of the regular monthly dividend of \$2 per share. On the 1000-ft level the ore stops are being gradually extended southward, and the 1650-ft level northward, following the west side of the ore vein. The ore at both points is of a splendid character. A drift west from winze No. 4, on the 1650-ft level, has penetrated the ore vein a distance of 22 feet, the entire distance being in ore of the richest character. On the 1650-ft level No. 3 winze has just been started and is now down 15 feet, the bottom in rich ore. The branch drift from the C. & C. shaft, on the 1750-ft level, is being pushed ahead to reach the ore at the very earliest day possible. The south drift on the 1450-ft level is still advancing, running west of the ore vein. The haul in this drift is steadily on the increase, and makes the progress necessarily much slower. Sinking the C. & C. shaft below the 1850-ft level is being pushed vigorously forward. The flow of water is still strong.

**CON. VIRGINIA.**—Daily yield, 500 tons of ore. The ore stops going south on both the 1300 and 1300-ft levels are yielding rich ore, and the west drift from winze No. 4, on the 1400-ft level, promises a yield of many thousands of tons of gold milling ore yet. On the 1550-ft level a large force of men are employed in enlarging the ore connections with the Gould & Curry and in opening the south end of the mine so as to get at the ore bodies remaining in that quarter. On the 1500-ft level a drift is being run southward in the ore vein to connect with winze No. 2, on that level, providing that a large amount of rich ore on that level ready for extraction. On the 1650-ft level the west cross-cut near the California line, which was stopped in the vein when the ledge was struck, is being extended to the westward to connect with the bottom of the Con. Virginia shaft, which is now being sunk from the 1550 to the 1650-ft level to meet the drift. The ore in the face of the drift is of a fine character. The ore stops on the 1650-ft level are being gradually extended to the southward toward the deep winzes. The sill floors continue in ore of the richest character. There will be no stoppage of the work of sinking the C. & C. shaft, but as soon as the 1850-ft station is opened the sinking will be continued, to reach and open the 1950-ft level.

**YELLOW JACKET.**—The main east drift at the 2200-ft level is in 245 feet from the winze. The face of the drift is in green porphyry, with promising seams of quartz. The new shaft is down 552 feet, with the bottom in good sinking ground. The water decreases continually. The heavy hoisting gear is being placed in position, and will be ready to start into active operation in about two weeks. **BONANZA.**—Sinking the main shaft is making the usual fair progress, the bottom in good working ground. The burst of water struck during the middle of the present month still continues, but the flow is now light and does not materially impede the progress of work. The present developments in the new shaft (as of the old; fully warrants the belief that a good body of pay ore is near at hand.

**SILVER NADABA.**—The south drift on the 1450-ft level has reached the south line, at which point an upraise has been driven a distance of 113 feet, to reach the level of the north drift, approaching through the Mexican ground. This raise was made at the rate of eight feet per day, being one of the quickest pieces of work of the kind ever performed on the Comstock.

**GOULD & CURRY.**—Sinking the main incline was impeded during the first portion of the week by a strong stream of hot water, that poured in from a crevice on the east side of the shaft. This necessitated the putting in of small pumps to carry the water to the station above, since which time the work has been progressing as before.

**LADY BYRON.**—The placing of the new hoisting machinery in working position is being pushed forward to completion as fast as possible. It will be ready for service in about a week.

**ALTA.**—The west drift, on the 1050-ft level, has reached the east wall of the ledge, encountering quartz and ore of a good character. As soon as the east wall was reached the drift was stopped, and two drifts, one north and the other south, started to run parallel with and along side of the ore vein.

**UTAH.**—Sinking the incline winze below the 1150-ft level is going steadily ahead, the bottom in hard blasting ground. The face of the north drift, on the 1150-ft level, is still in the finest character of quartz.

**CHOLLAR-POTOSI.**—Daily yield, 30 tons of ore, the assay value of which is \$23 per ton. There is no change in any of the old workings of the mine.

**SUTRO TUNNEL.**—The face of the header still continues in soft porphyry and clay, with occasional streaks of quartz. It is in the regular Comstock vein material. Water decreases somewhat. Total length of tunnel, 18,911 feet.

**CALEDONIA.**—The northeastern drift on the 1400-ft level is showing some very fine quartz and ore prospects. The drift north on the 1600-ft level is also looking very favorable.

**SICOR.**—Sinking the main shaft is going steadily forward, the bottom in ground of a very hard description.

**BULLION.**—The repairs to the shaft are steadily approaching completion.

**LEVIATHAN.**—The whole face of the south drift, at the 600-ft level, is in quartz with streaks of good ore.

## CHERRY CREEK DISTRICT.

**STAR.**—*Eureka Sentinel*, Aug. 25: We learn from Col. J. J. Dunne, who arrived last Thursday in Eureka, from an extended tour through the mining districts south and east of this point, that the Star mining company, of Cherry Creek, are erecting a 20-stamp mill, with roasting furnaces, at that place. The material for the building and the machinery are on the ground, and a force of men busily engaged in grading the mill site and framing timbers for the structure. The company are putting up a Howell's impromptu water-raising furnace, with a boiler that is running successfully on the ores of Brodie district. They are also building steam hoisting works on the mine. The mine is opened by a perpendicular shaft, which has attained a depth of 300 feet. It is well timbered from top to bottom, and the ore will be hoisted on a safety cage of the latest pattern. A splendid body of ore has been exposed in the lower level, and it is estimated that there are from 8,000 to 10,000 tons in sight, valued at from \$100 to \$200 per ton. The company expect to have the mill running in 60 days. The town, under the stimulus of operations at the mines, is living up and business improving.

## EUREKA DISTRICT.

**THE MATAMORAS MINE.**—*Sentinel*, Aug. 20: The Matamoras mine is proving itself to be one of the best properties in the district, and recent developments in the lower levels are very encouraging to the owners. A large body of very high grade ore has been struck, at a depth of 160 feet, and promises to prove a veritable bonanza. We were shown some magnificent specimens, taken at random from the drift, and upraise, which is claimed to be an average of the vein matter at that point. They were very rich in precious metals, assaying \$230 in gold and \$400 in silver, and carrying about 30 per cent. in lead. Mr. Dimock has submitted plans to the company for the erection of hoisting works and the building of a tramway from the mine to the foot of the mountain, in the neighborhood of the new proposed Prospect Mountain tunnel. It is thought that the tramway can be built and operated at a very small outlay.

The run at the Matamoras furnace has been a very successful and profitable one so far, and the company are well satisfied with their bullion returns; but, since the recent developments in the mine, the fact is recognized that greater results are to be expected. With this view, it is probable that great improvements will be added during the coming month. The company will, after the completion of the present run, tear down the old Butcherup, and rebuild further up the hill. This move is necessary, in order to procure more dump room. The new

furnace will be of the latest and most approved pattern, and have a reducing capacity of 50 tons per day.

**THE PROSPECT MOUNTAIN TUNNEL.**—The Prospect Mountain tunnel company are very much encouraged by recent developments in their tunnel. Work has been carried on very persistently for some months past, and a force of men employed in driving it into the bowels of old Prospect, hoping, when it had been carried a sufficient length, to meet with a lode that would recompense the company for their outlay. The first 500 feet were driven through hard limestone, and the progress was necessarily slow, but after that length was passed, the miners encountered quartzite, consisting of which are multibodies of rich ore. The enterprise is of vast importance to the quartz interest in that section, and on its developments hinges the investment of a large amount of capital.

## HUNTER DISTRICT.

**HOISTING WORKS.**—*Eureka Sentinel*, Aug. 25: Steam hoisting works have been erected over the main shaft at the Hunter Consolidated, and are in perfect working order. The shaft has attained a depth of 220 feet. The mine is looking well throughout the various levels, and there is a large quantity of rich ore in sight. The furnaces will be completed and started up about the 20th of September.

## TYBO DISTRICT.

**STRUCK.**—*Eureka Sentinel*, Aug. 20: The Tybo Consolidated Company at Tybo have struck a very rich body of ore in the "Hunkidori" shaft, and it is pronounced to be one of the finest developments ever made in the mine. A private letter, received in Eureka yesterday, states that the furnaces of the company will turn out more bullion during the month of September than ever before during the history of the camp; all of which is good news for our southern neighbor.

## WARD DISTRICT.

**PAYMASTER AND PLEASURES.**—*Eureka Sentinel*, Aug. 20: John B. McOee, the other day, made a critical examination of mining affairs in Ward district. He asserts that the future of the mine on which are situated the Paymaster and Pleasures is one of the largest and richest in the State. At some points he thinks its width is from 500 to 600 feet. The two mines above mentioned he considers grand properties. The ore is of exceeding high grade, and it seems to occur in the greatest abundance. Mr. McOee evidently believes that Ward has a bright future before it.

## Arizona.

**BRADSHAW.**—*Arizona Enterprise*, Aug. 18: In this county considerable work is being done. In the Bradshaw a force of men are at work upon the ore, and are taking out some good rock. P. A. Craicu has been busily at work preparing for the operations which are to be soon commenced on the Tiger by J. H. Helm. He has made a good road from the mine to connect with what is called Luke's road. The hoisting works, pumps, etc., for this mine have arrived in the Territory, and will soon be on the ground.

**LYNX CREEK DISTRICT.** There are a number of mines being worked in a small way, and yielding ore of high grade in paying quantities. The placer miners are also busy. Owing to the scarcity of water some of them are dry-washing and making wages.

**AQUA FRIA.**—Colonel Reynolds has men at work on the Eyrie mine on the Agua Fria. Some very rich chloride ore is being taken out. **ORO BONITA, Cram and Dolan** have taken out some very fine gold ore, much of it yielding as high as \$100 to the ton. It will be worked in astras.

**PECK.**—There is no material change in the mining operations in Peck district, with the exception of the preparations for taking in the Peck mill.

**WALNUT GROVE.**—The Hoeller mill in Walnut Grove district is being up rapidly, and will be in operation in a very few weeks.

**AZTEC MINE.**—*Arizona Citizen*, Aug. 18: We get the following news from this mine from Manager John E. Magee: Cut No. 2 is in 45 feet clear across the vein. Actual width of vein in the bottom of the cut, 13 feet 7 inches; solid body of metal six feet wide, with stringers on each side, carrying four to six inches of metal. Depth of the vein is 32 feet. On both sides of the vein the ore is gradually enlarging and becoming more solid. The character of the metal is slowly changing, and assays from \$100 to \$210 per ton. The wall and country rock is granite and syenite. The vein matter is fine quartz and some tale. There are about 60 tons of ore on the dump. Grinding for large ore dumps is under way, and general work is being done to put everything in the best possible shape. In September we will be ready to keep a 10-stamp mill running steadily.

**PINAL MINES.**—Times are dull, owing to the King mine discharging all its working men but seven. As to the King mine itself, it surpasses all other mines yet discovered in Arizona. I left Tucson last February and came to the King, but found everything looking so dark and gloomy that I went prospecting, and 10 miles northwest of the King I discovered a mine known as the Reynolds, after which the district is named. This mine is 65 feet in width, and can be traced six miles by its mineral, and on it are 13 locations of 1,500 feet each. I have a shaft down 50 feet on the Randolph, and the vein is about 90% free milling ore. Six miles from the north district is the pine stratum, so I went prospecting, and 10 miles northwest of the King I discovered a mine known as the Reynolds, after which the district is named. This mine is 65 feet in width, and can be traced six miles by its mineral, and on it are 13 locations of 1,500 feet each. I have a shaft down 50 feet on the Randolph, and the vein is about 90% free milling ore. Continued from page 130

stance looking like an oxide of iron. A lump of this odd ore, just as it comes from the mine, is shown at Wells, Fargo's office in Auburn. It weighs 9 ozs. 16 pwt., and its value is at least \$130. Mr. Bell has named this mine "Life Preserver," as he had passed through some pretty rough experience for several years before its discovery.

The future uses of Lake Tahoe water and the mining prospects of Placer county are naturally allied. Yet the lake is not wholly in Placer county. Besides being divided between two States, it lies partly in three counties of Nevada and also in El Dorado county, California.

No tourist can ever regret a visit to Lake Tahoe, and let us hope the readers of this sketch will not be wearied by this *quasi* visit with the writer.

July, 1877.

[As Major Wright concludes, carnelians are of inorganic origin. Both carnelian and chalcedony, and several others, are members of the quartz family, and are of flinty or silicious composition. On the other hand, amethyst, even its hardest known state, does not contain any silicious matter, but preserves its organic composition, and shows by analysis carbonic hydrogen and oxygen. We see no reason to hold for a moment to an organic origin for the members of the quartz family.—EDS. PRESS.]

## THE ENGINEER.

### The Rothschoberger Water-Adit.

After 33 years of uninterrupted labor the great undertaking of the Rothschoberger water-adit is so far completed as to admit of its use. The method of draining the Freiberg mines by means of a deep tunnel had already been discussed in the beginning of the present century, as a question of necessity for the future mining prosperity of the vicinity; and undoubtedly the Rothschoberger tunnel is the greatest work of the kind that has ever been undertaken to aid the exploration of a mining district. Other great adits, such as those of the Hartz mountains and the famous Sutor tunnel, fade when compared with a tunnel which has already attained a length of more than 26 English miles, and will be with its branches when completed more than 31½ miles. The plan was to conduct the water from the Freiberg mines to the nearest practicable point on the River Elbe. Rothschoberg, 12 kilometers above Meissen, was chosen as the most advantageous place for the mouth, on account of its having the lowest level at the shortest distance from Freiberg. The preliminary surveys were made in 1843, but the work was not thoroughly taken in hand until the third quarter of the year 1844. Since that time the driving of the tunnel has been unceasingly carried forward, but coupled with many hindrances and difficulties, such as quicksands, immense quantities of water, etc., which have trebled the cost and retarded its completion.

The tunnel is ventilated by eight air-shafts, and lies some 400 feet below the deepest Freiberg water-adit. It has a uniform height of 9.84 feet, with a somewhat smaller breadth. The present length of the adit with its ramifications is 43,000 meters (all of which length is now in use), and will be when completed over 51,000 meters, or 31½ miles. The cost of the tunnel is estimated at 12,000,000 marks or \$4,000,000, and will be paid for by a tax on all the mines which it directly benefits. The gradient of the floor is only 0.03m. in 100 meters. This small gradient may make it necessary to clear the tunnel occasionally, but this can be accomplished without difficulty with suitable boats and dredges. Five miles of this tunnel are perfectly straight, without the slightest curve, and along the whole length the curves are very light. One rather interesting occurrence during the past year was the striking of an old mine, of which no maps are in existence. This mine is probably more than four centuries old, and the timber which had been used as supports, etc., was found for the most part sound. Two new veins were also struck, but only one of them will be exploited. It is rather remarkable that nearly the whole driving of the tunnel has been done by hand, Burleigh drills, driven by compressed air, having been introduced only within the past year. The rock throughout nearly the entire length is solid gneiss, which accounts for the great time that has been taken to the work, it being necessary, with hand boring, to put in as many as from 40 to 50 holes to the face.

The necessity for the continued prosperity of the Freiberg mines, which have now been worked for about seven centuries, may be gathered from the fact that at the present time there are more than 6,000 laborers, with their families, amounting altogether to some 20,000 persons, who derive sustenance from the mines and metallurgical works connected with them. It may reasonably be expected that the Rothschoberger tunnel will give fresh impetus to the Freiberg mining, and considerably augment the output of ore, which has of late years somewhat fallen off, owing to the immense quantities of water which continued to flood the mines, and prevented the veins of ore being followed and worked below a certain depth.

Saxony may well, and justly be proud of a tunnel which is without doubt the longest in the world, and which has required so much time, perseverance, skill and labor as the Rothschoberger water-adit.

### Inland Sea in Algeria.

MM. Dumas and Danbree have urged several objections, says the *Engineer*, to the proposed artificial inland sea in Algeria, and agree with M. Naudin, who read a paper on the subject at a recent meeting of the Academy of Sciences, that its sanitary effects would be deplorable. It is thought that to fill the shallow basins of the region which it is proposed to convert into a sea with salt water would be equivalent to reproducing in Algeria all the worst features of marshy plains. Captain Roudaire, who proposed the scheme, admits that even in the center there would be nowhere more than about 80 feet of water, and the whole coast line would have so little water that it would be little better than a sandbank with an admixture of salt and fresh water, upon which the strong tropical heat would act in the most deleterious manner for two-thirds of the year, causing a rapid decomposition of organic matter, and spreading contagion for miles in every direction. M. Naudin considers that there is no similarity between this district and Egypt, the climate of which country has been much improved by the creation of the Suez canal and the plantation of trees; for, according to him, while Egypt lies between two seas, and is traversed by an immense river which has pericidal overflows, the Algerian district is far from the sea, and is bounded by arid deserts.

A CITY UNDER A LAKE.—An engineering problem, as interesting as the laying open of Pompeii, is involved in a strange discovery which is reported from the Lake of Geneva. A tourist having lost his trunk, two divers were employed to search for it. While they were below water they found what they supposed to be a village, since covered by the lake. Their statements led to the investigation of the spot by the municipal authorities, who took measures to ascertain the truth of the extraordinary account of the divers. On covering the placid surface with oil, these latter were able to distinguish the plan of a town, streets, squares, and detached houses marking the bed of the lake. The ruddy hue which characterized them led the observers to suppose that the buildings had been covered with the famous vermilion cement which was used by the Celts, Cimbris and the early Gauls. There are about 200 houses arranged over an oblong surface, near the middle of which is a space more open, supposed to have been used for public assemblages. At the eastern extremity lies a large square tower, which was taken for a rock. A superficial investigation seems to indicate that the construction of these buildings dates from some centuries before our era. The Council of Vaud has decided to have the site of the dwellings enclosed by a jetty stretching from the land, and to drain off the water, so as to bring to light what promises to be one of the most interesting archaeological discoveries of the present time.

THE NEW U. P. TERMINUS.—We read in the *Railway Age* that the long and anxiously awaited decision as to the legal terminus of the Union Pacific railway, having finally been given in favor of Council Bluffs, Iowa, that company have now commenced the erection of a grand depot building on this side of the Missouri river. The building will cover an entire square of ground one mile from the river and two miles from the bluffs proper, the site being the high bench of land east of Spoon Lake, immediately northeast of the present temporary depots. The building—in style English Gothic—will be of stone and brick; the outside facing, Omaha red pressed brick, with cut-stone trimmings; the roof to be covered with slate. The structure will form three sides of a quadrilateral. The main building, which faces east, is 210 feet long, 60 feet deep, and two stories in height, besides a mansard roof. From each end of the main building extends backward a wing 40 feet wide and 120 feet long, inclosing a court 130 feet wide and 120 deep. The wings are of one story, 20 feet in height in the clear, corresponding to the first story of the main building. The external measurement of the whole structure is 210 feet front and 180 deep. The court will contain four tracks, with covered platforms between them, for the arriving and departing trains of the Union Pacific.

ST. LOUIS PROJECTS.—An exchange says: "We are gratified to learn that the committee appointed by the Narrow-Gauge Convention will open an office and commence at once the work of organization and canvassing for subscriptions. The news from the interior is very encouraging along the whole line. The people are aroused and enthusiastic in favor of the work, and are prepared to subscribe money, material and lands to the construction of the road. We hope to see active and energetic men at work very soon, soliciting subscriptions to the work in St. Louis. In the same connection we must express the hope that before its recess the City Council will also take some action in behalf of the River and Rail Transit Company. The need of outlet from the Union depot to the river by tunnel, which the company proposes, is pressing felt. The company is already organized; the names of its members give ample earnest of the success of the undertaking. Let the Council act as quickly as possible."

RAILWAY BUILDING AND EARNINGS.—According to Mr. Poor's figures, the total mileage construction, at the close of the year 1876, was 77,470 as against 74,658 in 1875. The number of miles in actual operation, however, is reported at 73,508, leaving 3,962 miles of which no operating returns are given. There is an apparent increase of 1,749 miles operated in 1876 as compared with the previous year, and an increase of 2,812 miles in the total construction. The increase in construction over that of 1874 and 1875 is attributed mainly to the progress made with the Southern Pacific lines, and the narrow-gauge activity in Texas, Colorado and Ohio. No new lines of any magnitude have been undertaken. The gross earnings of all the roads show an apparent decrease of \$5,807,546, while the net earnings show an increase of \$946,314, a result that can only be accounted for by a greatly increased economy in operation; but whether this has been at the expense of the condition of the roads is a matter of conjecture. The causes of the falling off in gross earnings are sufficiently obvious. The dividends for the years ending at various dates during 1876, show a falling off of \$6,254,540 as compared with the previous year's reports, notwithstanding the increased net earnings.

SOUTH AMERICAN RAILWAYS.—Peru's example is catching all over South America, and the continent seems to be on the verge of a general revival of railway building. All the old plans are again up for discussion. One of the most interesting is that for a road from Buenos Ayres to the Pacific at Santa Rosa, Chili, which will tunnel the Andes at a height of 10,500 feet, the perforation being two miles long. It is now under debate in Congress of Buenos Ayres.

A DIRECT cable communication is to be formed between Sweden and Russia, the stations being Grisslehamn and Alaud.

### Arizona Mines.

The *Arizona Citizen* is indebted to Governor Safford, who has recently examined the mines north of Florence, for the following interesting mining items:

Most of the work in the Silver King mine is suspended for the present, for the reason that the company have upon their dumps more ore than can be concentrated in the next twelve months; and as there is no other machinery for working or reducing these ores there is neither room nor profit in piling it upon the dumps. The mine never looked more promising than it does at this time. The concentrator works to a charm, and two more of these machines have been ordered from San Francisco.

The Silver Bell, located about five miles from the Silver King, and owned by Whitlow & Co., is being rapidly developed, showing a large and exceedingly rich lode. It bids fair to rival the celebrated King.

Several other mines in this district are being prospected with good results. A number of locations have recently been made in the Superstition mountains, about 12 miles northwest from the Silver King, which give promise of becoming valuable mines. Seven miles north of Camp Pinal a promising mining district is being opened. One of these mines was recently sold to a San Francisco company. Active prospecting is being carried on in the main Pinal mountains, and two new mining districts have recently been formed on the western slope of them. There are now about 25 miners at work in Mineral Creek district, with the most flattering prospects. The lodes are large and well-defined, and the ore assays from \$100 to \$1,000 per ton in silver. One man has several tons on the dump that gave an average assay of \$900 per ton. These mines are located about 40 miles from Florence, near the Gila valley. Another district still east of Mineral creek has been organized by Putnam and others. Nuggets of nearly pure silver are frequently found in this district, that seem to have been broken off and detached from the lodes, and as far as the lodes have been prospected, they show very high-grade ore.

Explorations in Globe district have been extended through the mines to about 20 miles in length by at least 12 in width. A belt of mineral has been discovered running from Pinal creek in a northeasterly direction about 20 miles. Locations have been made upon this belt nearly all the way, and quantities of nearly pure silver have been taken out at various points the entire distance. The most notable locations are the mines in Richmond basin, owned principally by McMorris, Styles, Dickey, Chilson Bros., Miller and others.

The Stonewall Jackson location is near the northeastern end of the belt, and is probably the richest discovery yet made in the district. The owners, McMillan & Harris, have sunk a shaft on the foot-wall 70 feet deep. They have found a continuous crevice following the wall of metal, which is about 80% silver. From this shaft they have taken out already, without drifting or stoping, about \$80,000 in silver, and at the bottom of the shaft the silver crevice is wider and quite as rich as at any other point. Between the foot and hanging walls, and above this silver crevice, there appears to be a large lode of low-grade ore, and such seems to be the condition along the entire belt; but, so far, most of the developments have been confined to following the rich crevice.

The owners of the Sherman mine, about five miles from the Stonewall, boast of having taken out the largest silver nugget, one piece

weighing 450 pounds, supposed to be at least half silver.

Richmond Basin has been perhaps the best poor man's camp in the district. The Chilson Bros. have taken out and shipped at least \$50,000 worth of ore, running into the thousands per ton. McMorris & Styles took \$10,000 from a shaft less than 40 feet deep, and the prospects are better as they go down. Alwayney & Dickey, Miller & Co., and many others have also taken out large quantities of rich ore. The future wealth of this district will consist of the lower grade ores, that will pay a fair margin above the expense of mining and milling, as this will give employment to a large number of people and distribute the money.

Two new mills are in process of construction; one at the Champion mine, by J. D. Wilson & Co., and one at the forks of Pinal creek, by Townsend & Co. When completed, they will be in every respect first-class mills. It is believed that these mills will be kept constantly at work in good ore, and if so, they will give life and value to these mines not heretofore attained, and the stream of bullion they will constantly send to San Francisco will do much to attract attention to the whole Territory.

There are two small mills at present running in the district, and as they work high-grade ores, a considerable amount of bullion is constantly being taken out, the larger portion of which is sent east to Silver City and Mesilla to pay for goods purchased in that section; hence, Arizona loses credit for the bullion that is sent in that direction, and New Mexico gets it. As we mainly have to depend upon California for mining machinery and money to develop our mines, it would seem to be to the interest of those engaged in mining and milling to send their bullion where the Territory will get credit for it.

A furnace is being erected at Globe City for the reduction of copper-silver bearing ore, of which ore there is a large quantity in the neighborhood; in fact it would seem as if the eastern side of Globe district would be able to supply all the copper needed by the world. Globe City is improving. There are several stores doing a successful business and a few new houses being erected.

It is believed that a new town of some importance will be erected at the forks of Pinal creek, where Townsend & Co. are erecting their mill. It is located about four miles below Globe City, and is very centrally situated to the principal mines of the district.

### The Rocky Mountain Mill.

It gives us great pleasure to announce that this mill, destroyed by fire on the 31st of March last, has been rebuilt by Messrs. Mathews, Morris & Co., and is now open for business. The former mill machinery included a set of wet concentration works. The present works consist of crushing and sampling machinery only.

The mill building proper is a strongly built frame structure 40x60 on the ground, one-half of which is two stories, giving an upper floor 20x60 in addition to the ground floor. The ore is received upon the upper floor by an elevated timber and plank roadway running from Brownelle street, which is nearly on the same level, along the side and down past the end of the building, ending on Third street. This upper floor is divided by suitable bins, etc., and contains a Dodge crusher. Passing the crusher the ore falls into the rolls for finer crushing. These are of the Frazer, Chalmers & Co. pattern, 10 inches in length and 22 inches in diameter. Here the ore is sampled by hand work, and the sample will be put through finishing rolls standing near, on the lower floor. From here the sample is taken to the grinding room, which is separated from the customer's waiting room by a glass partition, where the grinding and final sampling may be seen if desired, but not meddled with. On the lower floor are the large Fairbanks scales, and ample room for storage of the crushed and sampled ore. The power is furnished by a 10x20 engine, driven by an upright boiler set outside the main building. The assay office was not rebuilt upon the old site, but adjoining the office which was saved. The assay office, built by Messrs. Dillingham and Higbee, is a model of convenience.

Although just getting ready to start, there are 400 sacks of ore in the mill waiting for sampling, and much more might have been taken but for the fear of keeping customers waiting. They commence crushing to-day. The new building and machinery have been put up by Mr. Conrad Hanson.—*Georgetown Courier*.

AUSTRALIAN CANNEL COAL.—A discovery has been made in Australia which confirms with singular minuteness the theory that assigns to cannel coal an origin from leaves. It is difficult to understand how leaves can accumulate free from dirt in sufficient quantity to form the beds of cannel coal, now several feet thick, and representing many times their mass in leaves. But in Australia just such a mass of leaves has been found, partially but not completely altered to cannel. The appearance and fracture of fresh blocks are the same as of this kind of coal found elsewhere, but after several years' exposure it can be separated into thin laminae, which shows that the mass is composed principally of leaves. The bed is six feet thick, and the government geologist calls it "incipient lignite."

A LARGE number of American manufacturers have just been awarded premiums at the Australian International exhibition.

## The Empire Mine, Idaho.

The Owyhee *Avalanche* says: Operations at the Empire mine have been temporarily suspended. The men working there were much dissatisfied at not receiving their monthly pay on the 10th, as usual; and not receiving satisfactory assurance that it was forthcoming immediately, they resolved to quit for a few days. They have charge of the works in the meantime, and if no change for the better occurs in a few days, they will proceed to work the mine themselves. We are, however, reliably informed that money is now on the way from San Francisco wherewith to pay the men, and that the mine will start up again in a day or two. Mr. Crutcher is reported to have left that city on Thursday morning, and has funds with him. There have been various reports in circulation relative to the progress of work in this mine during the past few weeks, and it is just possible that there may have been some "skulduggery" going on, but we have been unable thus far to get at "bottom facts." Whatever may be the upshot of it, it may be set down as a certainty that men will not now or hereafter work in our mines unless paid up within 10 or 15 days after the end of each month. They are perfectly right in taking this stand, as many miners here and many who have left us have realized from sad experience the losses and uncertainties attendant upon waiting six and eight months for pay which they never got. The miners are the bone and sinew of the country, and it is through their labors we expect to have our mines developed and the camp become prosperous again. They should consequently be paid promptly every month for their services, the same as a merchant pays his clerks, or the same as any prompt business man discharges such obligations to faithful employees. In such a mine as the Empire there is no good reason why there should be any delay in paying the workmen. The yield of rich rock has been good for the past three months, and while the management has not been as economically conducted as we think it should have been, it must be generally conceded that it is for the interests of the company and all concerned to have the work pushed forward in a practical and business-like way and the mine legitimately developed. The experience of the past few years has shown that we are sadly in need of outside capital to develop our mines; and, where this is furnished, it is the duty of every corporation to insist upon a judicious system of management, and that the work shall be so conducted that every transaction shall be capable of bearing the most rigid scrutiny. There has been considerable dead work performed in the upper levels of the Empire during the past six weeks, and it more than probable that this has something to do indirectly with the delay in paying the workmen. Whatever the trouble may be, there should unquestionably be a proper understanding between parties below and parties here, so that work should go on smoothly, and the rock upon which we have split so many times in this camp be avoided if possible. The Empire is good property and ought to yield handsome returns to its owners.

## Partners in Mines.

A matter of great importance to any person who is going to apply for a patent on a lode where there were at one time partners, but the partners having failed to perform their proportion of the annual work, is at the time of application an individual enterprise, will be found in the recent decision of the Department of the Interior given below:

**Proof Required in Application for Patents.** Where proceedings were had against co-owners of a mine who failed to pay their share of the required expenditure under section 2324 of the Revised Statutes. Full decision as follows:

"Where a party proceeds against one or more of his co-owners under section 2324 of the Revised Statutes of the United States, he must file with his application for patent a copy of the original notice of location and abstract of all conveyances made of the claim; a copy of the notice published to delinquent co-owners (which notice should embrace the names of all delinquents), to which must be attached the affidavit of the publishers of the paper in which the notice was inserted, that the attached notice was published for 90 consecutive days (giving dates); the affidavit of the claimant or claimant who have made the required expenditures (corroborated by the sworn statement of two or more disinterested witnesses), showing the character and extent of the claim, and the time when such improvements were made. There must also be filed the sworn statement of the claimant or claimants who have made the required expenditures as to whether or not either of the parties whose names appear in such published notice contributed his proportion of the required expenditure either during the 90 days' notice by publication or the succeeding 90 days. The evidence must be full, positive and explicit on all these points."

**THE GREAT GUN.**—"I hear," says a writer in *Mayfair*, "that Russia has bought the largest gun yet manufactured by Krupp. The giant was formerly at the Philadelphia Exhibition, and nearly wrecked the steamer *Essex*, which conveyed it to Russia. Its bore is 14 inches; the charge consists of a steel shell of 1,254 lbs., with 302 lbs. of prismatic powder; its velocity is 1,590 feet in a second."

## USEFUL INFORMATION.

## Killing Cattle with Dynamite.

An interesting experiment, says the *Pall Mall Gazette*, was made last week at a hereslaughting establishment at Dudley, with a view of testing a new system of slaughtering cattle by means of dynamite, and thus putting them out of existence more speedily and with less suffering than by the ordinary pole-axe.

Two large, powerful horses and a donkey (disabled for work) were ranged in a line about half a yard apart under a shed, the donkey being placed in the center. A small primer of dynamite, with an electric fuse attached, was then placed on each side of their foreheads and fastened in position by a piece of string under the jaw. The wires were then coupled up in circuit, and attached to the electric machine, which stood about five yards in front. The handle of the machine being then turned, an electric current was discharged, which exploded the three charges simultaneously, and the animals instantly fell dead without a struggle.

The whole affair was over in two minutes, and the experiment appears to have been a perfect success. It was conducted by Mr. Johnson, agent for Nobel's Explosive Company, Glasgow, assisted by Mr. Harris, one of the dynamite instructors. By this means, it is stated, any number, even a hundred or more cattle can be killed instantly by the same current of electricity. There cannot be a doubt that the present system of slaughtering cattle is open to the charge of being cruel and barbarous, and the slightest want of skill on the part of the slaughterer often subjects the unhappy beasts to horrible torture. Any attempt to extinguish life painlessly is a step in the right direction, not only as regards cattle, but as regards criminals sentenced to capital punishment, whose case equally deserves consideration.

**WINGS AGAINST STEAM.**—A short time ago there was a race from Dover to London between the Continental mail express train and a carrier pigeon, conveying a document of urgent nature from the French police. The pigeon, which was bred by Messrs. Hartley & Sons, of Woolwich, and "homed" when a few weeks old to a building in Cannon street, City, was of the best breed of homing pigeons known as "Belgian voyageurs." The bird was tossed through the railway carriage window by a French official as the train moved from the Admiralty pier, the wind being west and the atmosphere hazy, but with the sun shining. For upwards of a minute the carrier pigeon circled round to an altitude of about half a mile, and then sailed away towards London. By this time the train which carried the European mails, and was timed not to stop between Dover and Cannon street, had got up to full speed and was proceeding at the rate of 60 miles an hour toward London. The odds at starting seemed against the bird, and the railway officials predicted that the little messenger would be beaten in the race. The pigeon, however, as soon as it ascertained its bearings took the nearest homeward route, in a direction midway between Maidstone and Sittingbourne, the distance "as the crow flies" between Dover and London being 70 miles, and by rail 76½ miles. When the Continental mail express came into Cannon-street station, the bird had been home 20 minutes, having beaten her Majesty's Royal mail by a time allowance representing 18 miles.

**PRESERVATION OF EGGS.**—The *Journal of the Medical Academy of Turin*, in a recent number, says: The sure and simple method of keeping eggs sound by smearing the shells with linseed oil has long been practiced. The oil forms a sort of film over the shell, thereby preventing the two immediate causes of decomposition—evaporation from and penetration of air into the egg. A recent experiment in point deserves notice. A dozen new-laid eggs were rubbed over with linseed oil applied with the tip of the finger; another dozen were coated in like manner with poppy oil; two more eggs were left in their natural state. The whole 26 were then laid close together, in three rows, on dry sand upon a shelf, where they were left undisturbed. At the end of three months they were weighed, and again at the end of six months, when they were opened. The two eggs left in their natural state at the end of three months had lost 11% of their weight, and at the end of six months 18%, and were found to be half empty and the contents rotten. The eggs coated with poppy oil in three months lost 3%, and in six months 4½% of their weight. The eggs were still full and devoid of unpleasant smell. The eggs rubbed over with linseed oil in three months lost 2%, and in six months 3% only of their weight, and when opened were found to be full, with the smell of fresh eggs.

**BRASS LACQUERING.**—If you want a good deep gold lacquer you should make up a small stock bottle, holding, say, half a pint, according to the following recipe. You can then add as much as may be required for the tint you wish to get: Alcohol, ½ pint; dragon's blood, 1 dram; seed lac, 1½ oz.; turmeric, ¼ oz. Shake up well for a week, at intervals of, say, a couple of hours; then allow to settle, and decant the clear lacquer; and if at all dirty, filter through a tuft of cotton wool. Mix with the pale lacquer a day or two before you wish to use it.

## Notes on Steam.

*Saunders' Journal* instances the following: Steam arising from water at its boiling point is equal to the pressure of the atmosphere, which is 14.72322 lbs. at 66° upon a square inch.

In all calculations concerning steam it is necessary to have some or all of the following elements, viz:

Its *pressure*, which is termed its tension or elastic force, and is expressed in pounds per square inch.

Its *temperature*, which is the number of degrees of heat indicated by a thermometer immersed in it.

Its *density*, which is the weight of a unit of its volume compared with that of water.

Its *relative volume*, which is the space occupied by a given weight or volume of steam, compared with the weight or volume of the water that produced it.

Steam in contact with water is at its *maximum density*.

Under the pressure of the atmosphere alone, the temperature of water cannot be raised above its boiling point.

The *expansive* force of the steam of all fluids is the same at their boiling point.

A cubic inch of water, evaporated under the ordinary atmospheric pressure is converted into 1,700 cubic inches of steam, or, in a unit of measure, nearly one cubic foot, and it exerts a mechanical force equal to the raising of 2,120 pounds one foot high.

27,222 cubic feet of steam at the pressure of the atmosphere weighs one pound avoirdupois.

The *velocity* of steam, when flowing into a vacuum is about 1,550 feet per second when at an expansive power equal to the atmosphere. When at 10 atmospheres the velocity is increased to but 1,780 feet; and when flowing into the air under a similar pressure it is about 650 feet per second, increasing to 1,600 feet for a pressure of 20 atmospheres.

**NEW MODE OF REPRODUCING DESIGNS ON GLASS.**—A mode of effecting this, which is a modification of the process by which copper-plate engravings on paper are transferred to porcelain, has been invented in France. As fine-line copper-plate engraving would not adhere to glass, others having considerable depths are used; also, to impart to the enamels that thickness which the glass requires, stearates and oleates are added to the silicates and borosilicates, which serve to support, or to fuse, the colored or coloring oxides; and for a vehicle, a solution of resin, in ether or benzine, is added to the mixture. Impressions, taken mechanically on paper, with this ink, from engraving rollers, are transferred to the glass, which is then treated as in similar processes with porcelain, and is finally placed in the furnace. Effects of great artistic merit are thus obtained at a trifling cost.

**BRAZING BARR SAWS.**—Good brass rich in copper is generally used. Bring the two ends of the saw close together and fasten; then take a small pan of charcoal, and place it under the ends and direct the flame of a blow-pipe on it. As the ends will soon become red-hot, sprinkle some powdered borax upon them and add the solder with a piece of iron. The way to make the solder melt: three parts of brass filings with one part of silver; cast in ingot and file away; collect the filings, and put into solution of sal-ammoniac in water, and so keep until wanted.

## GOOD HEALTH.

## Caisson Disease.

Most readers are doubtless unaware of the fact that Mr. Roebling, the well-known engineer and suspension-bridge builder, is the helpless victim of a malady called the caisson disease. The *New York Sun*, in a recent note on the East river bridge, says: One singular fact about the construction of the great bridge is that its chief engineer, who has conceived it in all its details and has directed its construction week by week, and almost daily, has seen less of the bridge than any resident of Brooklyn or New York who has crossed the ferry. Mr. Roebling has not been near the structure for three or four years. He is a victim of the caisson disease, which afflicted so many of the men employed in sinking the great caissons on which the bridge towers stand, and it is not expected that he will ever recover from it. This malady is defined as being a disease depending upon increased atmospheric pressure, but it always develops after the pressure is removed. The pressure in the New York caisson, when it was about 78 feet deep, was 36 pounds to the square inch. This work being the most important of all, Mr. Roebling, although knowing its perils, repeatedly visited the depths of the caissons personally.

The result is that he is stricken down for life with a disease which is practically incurable. In his case, besides the usual pain in the extremities of the body, he has become paralyzed, and his nervous system is greatly impaired. Last fall, when it became necessary to remove him from his home in Trenton, N. J., to Fifth street, in this city, he was put in a canal boat and drawn by a tug to the point nearest his residence. He was unable to travel in any other

way. A few weeks ago he was removed to his residence at 110 Columbia Heights, Brooklyn, in the same way. He was carried on a stretcher to the canal boat, and placed on the dock. As he was drawn up the East river by the tug, he saw the completed towers and the temporary foot bridge for the first time. "Ah," he said, "that's just as I expected to see it." He is unable to leave his residence, and his staff of engineers receive instructions almost daily from him.

**HINTS TO STUDENTS.**—"Sleep is the only entire and absolute cessation of the mental and bodily expenditure; and perfect or dreamless sleep the greatest cessation of all. Whatever shortens the due allowance of sleep, renders it fitful and disturbed, or promotes dreaming, is so much force wasted. In the waking hours there may be cessation from a given exercise, with more or less of inaction over the whole system. The greatest diversion of the working forces is made by our meals; during these the train of thoughts are changed, while the body is rested. Bodily or muscular exercise, when alternated with sedentary mental labor, is really a mode of remission accompanied with an expenditure requisite to redress the balance of the physical functions. The blood has unduly flowed to the brain; muscular exercise draws it off. The oxidation of the tissues have been retarded; muscular exercise is the most direct mode of increasing it. But definite observations teach us that these two beneficial effects are arrested at the fatigue point; so that the exercise at last contributes not to the refreshment, but to the exhaustion of the system."—*Popular Science Monthly*.

**WHAT TO EAT IN SUMMER.**—Dr. W. H. Vail publishes an article on summer diet, and makes the following argument: "God, in his providence, has stocked the polar regions with the seal, the whale and the bear; all the personification of fat and oil—while vegetation is comparatively unknown. On the other hand, as you approach the tropics, oranges, bananas, lemons, and all our luscious fruits greet you on every hand, and vegetation runs wild. This disposition of Providence teaches us—what our appetites confirm—that in cold weather our diet should consist mainly of oily substances, or such food as is converted into fat by the process of digestion; while in the summer we should select such articles of diet as are not convertible into fat." Dr. Vail adds that vegetation, the edible parts of which ripen underground, such as potatoes, carrots and parsnips, are heat-producing, while those that ripen above ground are cooling. The latter, including especially asparagus, lettuce, peas, beans, tomatoes, corn and all fruits, should be freely eaten. Meat should not be eaten oftener than twice a day, and lean is preferable. He particularly recommends tomatoes.

**DISINFECTING THE DOCTORS.**—Dr. Seaton, medical officer of health, remarks in a late lecture: There are many occasions where the clothes of the medical attendant require disinfection, as, for instance, after visiting a group of smallpox or scarlet fever patients. Where the practitioner has been unfortunate enough to have a patient with puerperal fever under his care, the linen requires to be boiled, and the other things barked, before being worn again at a labor. But it is to the bands that he must pay special attention, and it is here that the disinfecting properties of chlorine are particularly useful. The hand should be well soaked three or four times daily in the chlorinated soda (P. B.). If this is done for a week, baths used at the same time frequently, and the clothes disinfected, practice may be resumed without danger. Length of absence will not compensate for a neglect of these precautions, as the practitioner may communicate the disease after many months.

**HYPOSULPHITE IN DIPHTHERIA.**—A very large number of diphtheria cases are cited by a Boston physician as having been successfully treated, in his own practice, by the use of hyposulphite of soda, in doses of from 5 to 15 grains or more in syrup every two or three hours, according to the age and circumstances; as such as the patient can bear without physicking being a good rule in the severer cases. The tincture can be used in doses of five drops to half a drachm, in milk, the amount for thorough stimulation being greater than can be taken in water; and, in the treatment of children, the milk thus used answers for food. As, however, the hyposulphite prevents the digestion of milk, it should not be given in less than an hour from it, though they may be used alternately in frequent doses.

**A WISE DECISION.**—At a late meeting of the New York Board of Health, a communication was received from the Board of Police in respect to a proposition of a firm of disinfectant manufacturers to disinfect the garbage and street dirt with a mixture of carbolic acid and copperas, at the place of final deposit, and requesting the opinion of the Board as to whether the garbage and street dirt so treated is suitable for filling purposes within the city limits. The Board decided that the disinfection of the material with the preparation referred to renders it less offensive, and that it may be safely used in the filling-in of bulkheads and docks; but it cannot, they say, be safely used in localities likely at any time to be occupied by dwellings or factories.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS**—Bridge Construction; Mining Accidents, 129. The Week; Prospecting Old Ground; A Strike in Calaveras County; Mining Suits; Past Product and Profit of Precious Metal Mining, 132. Items of Interest from the Mines; Betts Spring Company; New Style of Elevator Hoist, 137. Patents and Inventions; Notices of Recent Patents; Miners' Union and Mining Companies; Affairs at Eureka, 140. **ILLUSTRATIONS**—Jewels of Bridge Built by the Pacific Bridge Company, 129. Lake Tahoe, 137. **CORRESPONDENCE**—Lake Tahoe, the Loch Lomond of California—Its Character—Its uses, 130-34. **MECHANICAL PROGRESS**—A Cotton-Picking Machine; Machine Belting; A Batching Car; Musical Machinery; Firing Under Water; The Perils of the Foundry; An Immense Contract; Casting Babbitt Bearings, 131. **SCIENTIFIC PROGRESS**—Camping on the Pole; The Geology of British Columbia; The Origin of Petroleum; Spontaneous Production of Protoxide of Iron; New Standard Light for Gas Testing, 131. **THE ENGINEER**—The Rodschonberger Water-Adit; Inland Sea in Algeria; A City Under a Lake; The New U. P. Terminal; St. Louis Projects, 134. **MINING STOCK MARKET**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 132. **MINING SUMMARY** from the various counties of California, Nevada, Arizona, Montana, Oregon, Idaho and Utah, 133-140. **USEFUL INFORMATION**—Killing Cattle with Dynamite; Wings Against Steam; Preservation of Eggs; Brass Lacquering; Notes on Steam; New Mode of Reproducing Designs on Glass; Brazing Band Saws, 135. **GOOD HEALTH**—Cholera Disease; Hints to Students; What to Eat in Summer; Disinfecting the Doctors; Hyposulphite in Diphtheria; A Wise Decision, 135. **MISCELLANEOUS**—Arizona Mines; The Rocky Mountain Mill; Australian Canal, 134. The Empire Mine, Idaho; Partners in Mines; The Great Gun, 135. The Combination Shaft; Nevada County Copper Interest; A New Mexican Process; A Folding Boat; Working the Flue Dust, 138. Pavilion Garden; Demolished, 139. **GENERAL NEWS ITEMS** on page 141 and other pages.

## NEW ADVERTISEMENTS.

Manual and Catalogue, G. S. Woolman, N. Y.; Visiting Cards, J. B. Husted, Nassau, N. Y.; Delinquent Sale—Cherokee Flat Blue Gravel Co.; Postponement—California Fruit Growers' Association.

## The Week.

As will be seen by the account in another column, the week has been characterized by the occurrence of a number of mining accidents, in several instances fatal. It seems impossible to place safeguards in such a way as to entirely overcome the dangers of mining, and these accidents come upon the miners usually in a bunch, as it were. We note this week a good strike in Tybo District and another in Calaveras county; but where one is needed most is the Comstock; although some of the features of the mining aspect are favorable, there has been no important strike. We give a statement elsewhere of a very important matter in connection with labor questions on the Comstock, where an amicable understanding between superintendents and miners has been arrived at without much debate or trouble. The point gained by the Miners' Union is an important one for them, showing that the organization must be a strong one or it could not have been carried so easily. However, as all interested are satisfied and have decided the matter amicably, it is nothing in which the public generally have anything to say, and interminable discussions on the subject are nipped in the bud.

The exciting theme of the passing days is next week's elections. The press of the State is lashing itself into a fury, from which we suppose a clearer and surer safety to us all will eventuate, as wine is clarified by its working. In the contests now in progress we have no hand or voice as a journal. Not that we do not appreciate the duties of citizenship; not that we do not sincerely desire the well-being of our State. Our work is in another field, and here we stand ready to do good service for our readers, both now, when the storm without is at its height, and afterwards, when the minds of all shall return again to the promotion of noble, practical and progressive industries.

## Prospecting Old Ground.

Every now and then we hear of a new mine having been found in a locality where mining has been carried on for many years, and where all the mines were supposed to be worked out. As a general thing it is some new-comer who makes these strikes; some one who leaves the beaten track, or who, following it, has what the miners call "greenhorn luck," and tumbles over what experienced men have looked for in vain. Instances of this kind are by no means rare, particularly in California, where extensive tracts of ground were prospected and worked over in early days in a careless sort of fashion; when a dollar was of not much more importance than a 25 cent piece is now. This sort of ground having been worked, prospectors look for new fields, not caring to risk much time in gleaning where the bulk of the harvest has been reaped. Of late, however, those who mined in the early times have called to their remembrance certain promising indications or chances, and have gone back to look them up. Lots of claims have been re-located, within the past year, under these circumstances, and many more, because, with more economical views and better experience, they could be made to pay; whereas, with high-priced labor, costly manipulation, and extravagant expectations, the miners of 10 or 15 years ago would not touch them.

Perhaps, after all, the circumstances are rather more encouraging than otherwise. A number of small mines, giving independent employment to a half dozen or so men and worked in partnership for the profit to be made from them, are of infinitely more advantage to the country than a few worked by large companies. In one case the profit is scattered among a class of people who need it, will appreciate it, and spread it in various channels in the locality from which it is obtained; in the other, the profits are absorbed by a few individuals and added to the wealth already hoarded up, to be used at cent. per cent., and in a way to be of little real benefit to the community.

The miners who take up these old, abandoned claims, or find new ones in old ranges, are generally men who work the claims themselves, with the help of a few others. Although the hullion products of such ventures are comparatively small, in the aggregate they swell to material amounts; and it is encouraging to note the number of men who are able by this means to keep steadily at work. It takes energy and hard work to get anything out of an ordinary quartz mine after it is found; but it is much more pleasant for a man to keep steadily at work for himself, even if it is hard, than to labor for somebody else whenever he gets a chance. These small mines will make a more prosperous interior for this State than many think, and give vigor again to many camps which were supposed to be worked out and dead. The prospectors who took up the mines of late for lack of anything else to do, have opened many an old claim and found many a new one, and they are hard at it yet all over the country.

## A Strike in Calaveras County.

One of those ledges for which people have searched for again and again was found a few weeks since in Calaveras county, after the ground had been thoroughly prospected by various parties for the past 12 or 15 years. In the placer-mining regions of this State, when the gulches and ravines were worked out, the miners started in to look for the ledges which furnished the gold found in the creeks. In very many instances they were found in the hillsides near by, and again no traces were discovered. Where, however, they found rich pieces of quartz only slightly abraded and worn, they naturally concluded that the purest ledge must be close at hand, and, in such cases, always searched diligently for it.

This was the case at Corral gulch, near El Dorado, on the road to, and about four miles from, Sheep Ranch mine, in Calaveras county. The gulch was rich, but was worked out years ago. While it was worked, many handsome, rich quartz specimens were found, and frequent searches were made for the ledge from which they came. A lead was found on the hillside near by, some time ago, but it never paid; still, as no other was found, most persons concluded that this was the one. This belief was not shared in by all, however, as what follows will show.

Two miners, named Lambing and Durst, the former of whom was here in early days, and who has since mined in Colorado, Wyoming, and all over the coast, but returned to California not long since, went up to Calaveras county to prospect. They leased a mine and bought a little eight-stamp mill, on Murry creek, about two and half miles distant, in what they considered a good locality. Seeing some of the rich quartz found in the gulch, and comparing it with the rock found in the ledge above, they saw considerable difference, and came to the conclusion to buy the ground above and prospect for the ledge. With rare good luck they struck the long-looked-for ledge the first day they tried for it, and have been amply repaid already.

The rock is remarkably rich in gold, so much so that considerable of it has been sold here to jewelers for specimens. We saw a sack of this rock, this week, intended for jewelry, brought to the city by Mr. Lambing, and it was such as to make any miner's eyes water; if assayed, it would run into figures we should be afraid to mention.

The ledge has been stripped for 120 feet, and shows specimen rock of the character named all along. At 440 feet from the end of the stripping, it was uncovered again, and, although showing no free gold, it all prospects well, and will, perhaps, average about \$25 per ton. Mr. Lambing does not think it a shoot, but a true vein. The ledge is from 15 to 30 inches in width, the latter at a depth of thirty-four feet. The shaft is on the extreme end where they uncovered the vein. The mine was found only a little over a month ago, and, with 10 men, they have taken out 50 tons of rock. The specimens referred to were found near the surface, and, as far as stripped, it shows free gold. The mine has been named the Hero, and, if "it keeps up its lick," will make a record for itself.

There are a number good ledges up in that vicinity which are paying well, we are informed. The Greek mine had a crushing of about 100 tons of ore, recently, part of which yielded \$34 per ton and part \$19.50. The Horsethief claim pays from \$15 to \$17 per ton, its ore being worked in an arastra. It is a large, well-defined ledge. A test crushing from the Dughie mine showed a result of \$12 per ton.

## Mining Suits.

One day this week Louis Kaplau was fined \$100 by Judge Wheeler for contempt of court in assuming to act as Secretary of the Mahoney mining company in defiance of an injunction issued by the Nineteenth District Court. On the 23d of June, Judge Wheeler issued an order restraining Ignatz Steinhart, S. Heydenfeldt, P. N. Lilienthal, Otto Eselie, F. A. Benjamin and Louis Kaplan, their agents or attorneys, from acting or attempting to act as Directors, Secretary or officers of the Mahoney mining company. The order was issued upon the petition of William Stewart and others, for whom T. I. Bergin appeared as attorney. Mr. Bergin said that Kaplan, disregarding and ignoring the decree of the Court, and acting under the advice of counsel, which he accepted as paramount to the restraining order, had assumed to act as Secretary and insert advertisements, institute suits, and perform other duties of that office. Mr. Sharp, attorney for Kaplan, said that the opposing party had forcibly taken the books away from the Secretary's office, and with the books took 200 shares of stock. He contended that Mr. Kaplan was Secretary until his successor had been chosen, and was the rightful custodian of the company's records, and had the power to institute suit to recover property.

Mr. Kaplan was called to the witness stand, and said: I was served with a copy of the restraining order. It directed me to refrain from acting as Secretary of the Mahoney mining company. I caused advertisements to be inserted in the paper on the advice of counsel. I did not intend to disobey or disregard any order of this Court. I am a servant of this corporation, and for four years' service I have received \$1,000, while the honorable Senator Stewart has expended \$140,000.

Court—Your action in this matter was in clear and defiant contempt of this Court, and counsel who advised you did so in defiant contempt. I must assume that a gentleman of your undoubted intelligence has sufficient knowledge of language to comprehend the meaning of a restraining order. I cannot believe that you were ignorant. I am satisfied that you acted under the influence of others, and I will therefore make the fine very light. Mr. Kaplan, I will fine you \$100, and give notice that the severest penalty shall be imposed if the restraining order is again violated. I will suggest to you, Mr. Sharp, to use your influence to prevent further violation.

A number of stockholders of the Henrietta gravel mining company, who have become dissatisfied with its management, met in the Police Court-room, this week, for the purpose of discussing their grievances and taking steps to remedy the evils of which they complain. Wm. Sciloss was chosen Chairman; M. J. Blackman, Secretary; and E. Lewesmann, Treasurer. After the list of stockholders had been called, the President stated that the main object of the meeting was to inquire why the promised June dividend had not been paid, and protest against the assessment which had been levied instead. Among the items of expenditures were some \$800 to one of the Directors, \$5,000 upon a note given to purchase the mine, and \$450 for office furniture, which he thought was worth less than \$50. A committee, consisting of A. Blackman, H. Hollis, and E. Camboni, were appointed to examine the books and report at a subsequent meeting, to be called by the Chair.

S. B. Dent has applied to Judge McKee, of the Third District Court, for a writ of mandate against W. B. Chuff, N. A. Westfall and J. M. Buffington, commanding them to exhibit the books of the Blue Gravel mining company. Plaintiff's petition sets forth that the defendants and he are Directors of said company; that a meeting was called; that plaintiff found it necessary to look over the books to enable him to act understandingly, but the defendants refused to allow him a sight of the same. The writ was granted.

## Past Product and Profit of Precious Metal Mining.

In the *Engineering and Mining Journal* there appeared, not long since, an article wherein the profits that have attended the business of gold and silver mining in this country were briefly considered. While the conclusions arrived at by the writer were, in the main, correct, he appears to have fallen into several minor errors that call for correction. For instance, he assumes that if this business has, as a whole, proved profitable, it follows that a majority of individual ventures must have paid. This position is clearly untenable. Of the many who, first and last, have invested in the silver mines of Nevada, not one in ten has ever got his money back; and yet the business, as a whole, may be pronounced a success, the gains of the tenth man having been sufficiently large to cover all expenditures and leave a fair margin for profits; this remark applying, though with less force, to California, and other mining countries. But for the large production made by the Comstock lode, mining in Nevada would have proved a signal failure; and had it not been for the discovery of the last great bonanza at Virginia City, the business even here, in view of the money expended, would have been able to make but a very poor showing.

Again, says the writer, almost all the capital invested in this branch of mining—estimated by him at \$360,000,000—has come from the Eastern States and Europe. Whatever the amount of money obtained from that quarter, certain it is, the inhabitants of the several mining States and Territories have also invested heavily in this business, their contributions having been larger, no doubt, than those of all other investors combined.

In this article, the number of miners actually at work throughout the entire West is set down at 25,000. This is an under estimate. There are, in ordinary times, over 4,000 miners employed on the Comstock range alone. Not less than 30,000 Chinamen are engaged in mining in this country; wherefore, there must be, at the lowest calculation, as many as 50,000 men at work in the mines and mills throughout the territory west of the Rock mountains, and the number may even be much larger than this. In this State there are known to be fully 20,000.

Having stated the total product of the precious metals, made during the past 27 years, at \$1,850,000,000, this writer remarks that these figures represent only the bullion shipped through regular transportation companies, the considerable amounts carried away by individuals, of which no record has been kept, not being included therein. In this latter conclusion he is again a little at fault, an allowance of 20% having been allowed by those who compiled these statistics on account of bullion transmitted through private hands. The above calculation really covers 28 instead of 27 years. This discrepancy is not, however, of much importance, the omitted year—1848—having turned out only about \$5,000,000 in gold dust. It should also be noted that the grand total, as here set forth, embraces \$30,000,000 received during these 27 years from British Columbia and \$6,000,000 brought to this port from Northwestern Mexico. To be accurate, therefore, the value of the precious metals turned out on our own territory had amounted, at the beginning of the present year, to \$1,814,000,000, omitting some \$27,000,000 or \$28,000,000 produced in the southern Atlantic States. If this last item and the yield of the current year to date be added to the bullion before turned out, we have the sum of \$2,000,000,000 to represent the value of all the gold and silver heretofore produced within the limits of the United States.

The author of the article under notice estimates the cash value of all our gold and silver mines at \$150,000,000, and of our mills and reduction works at \$200,000,000—a very moderate calculation certainly. The amount of money invested in our mines is by him set down at \$360,000,000; all, as before stated, assumed to have been obtained from the Eastern States and Europe. The value of the labor expended, all put in by the inhabitants of the mining districts, is fixed at \$324,000,000, and the value of the personal assets, being goods, teams, etc., brought into these districts from abroad, at \$25,000,000, making a total investment for which the mining interest is to be debited, of \$709,000,000. Against this we have bullion produced, \$1,850,000,000, and created values represented by mines, mills and reduction works, \$350,000,000; a total of \$2,200,000,000. Deduct from this value of investments made in aid of mining, and we have the sum of \$1,491,000,000 to represent the net profits realized from the business during these 27 years.

According to this data, the annual product of our mines during this period has averaged \$68,500,000. The annual net profits have averaged over \$55,000,000, a rate of interest equal to 13% per annum on the amount invested; the whole of which is probably not much out of the way.

The Academy of Sciences, on Thursday evening, gave a reception to Sir Joseph Hooker, of the Royal Society; Prof. Hayden, of the U. S. Geological Survey, and Prof. Asa Gray, Director of the botanical gardens at Cambridge.

The Combination shaft only lacks 15 feet of reaching the level of the Sutro Tunnel.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

In the Imperial they are now cross-cutting east as fast as possible, preparatory to starting joint winze on line between Imperial and Alpha. The cross-cut continues in favorable looking ledge matter, being porphyry with streaks of quartz assaying from \$8 to \$12.

They are retimbering the shaft of the Bullion, between the 200 and 300 feet levels.

The Ophir and Mexican joint winze is down 76 feet.

Letter from the De Fries says: During the week all the claims against the company have been liquidated, and all work discontinued for the present, but sinking the main shaft, which is now 210 feet below the surface. We will open up another level from this depth.

In the New England mine work has been suspended in the winze which was being sunk on the front of the pay chute on account of the strong flow of water. The ledge on bottom of main incline is of an average of two and a half feet thick and of fine quality.

The face of the east drift, 1150-foot level, of the Justice will be substantially timbered as progress is made. South lateral drift, 1000-foot level, is passing through favorable vein matter carrying but little metal.

Cross-cut No. 1 from the 1700-foot level of the Gould & Curry is now very near the ground that compelled the stoppage of the main cross-cut; quite a stream of water is flowing from it.

The operations at the Eureka Consolidated mine, last week, were very satisfactory. There have been extracted and delivered at furnaces 777 tons of ore, taken from the fifth and sixth levels of the mine; the fifth level furnishing about two-thirds, and the sixth level about one-third of the supply. The ore dumps at mine and furnace are full to overflowing. From the present condition of the mine we can extract from 400 to 500 tons daily, and will be enabled to increase upon this amount as soon as we have completed certain changes now being made to facilitate hoisting from the lower levels, where there is an unlimited supply of ore. The bullion product for the week has been 300,559 pounds—a shade less than the previous week. Have shipped about the same quantity.

In the Leopard mine they have had to stop work in the face of 400 and 500-foot levels, until they got the connection made between the 500 and 600 feet, as the air is close. The 600 is in 409 feet, showing quartz and heavy bodies of iron.

The Superintendent of the Coso Consolidated is still taking out ore from the lower winze stopes of good quality. The ledge on the east will average three feet galena ore. On the west the ledge is increasing in width and improving in quality.

Work in the Gila mine is progressing as well as usual. Good headway is being made in cross-cut and drift, with encouraging prospects in both. The stopes are producing some very fine ore, which seems to be increasing every day.

The strike reported in the Hussey mine, on the 22d inst., has been further tested by shaping the drift. In so doing some 200 or 300 pounds of fine ore were taken out. The ledge looks fine and the ore is rich. Haste to connect this drift with the drift from the winze prevent starting drifts on the ore for a day or two; will start them as soon as the main drift is sufficiently advanced.

The developments in the Joe Seates and Geo. Douglass shaft are said to indicate that the shaft is of the identical character of the original Comstock; the water that comes in with the increased depth of the shaft, coming from the ledge itself, proves an extensive ledge, and the pitch corresponding with the parallel Comstock lead.

**LADY BRYAN'S TROUBLES.**—The dissatisfied stockholders of the Lady Bryan mine held a meeting in the Fourth District Court-room on Monday night. It was resolved to place all the stock in the hands of the Secretary of the Safe Deposit Company, subject to the order of the Executive Committee. It was also decided to sell all stock upon which the second assessment levied by the Committee had not been paid, the proceeds to be distributed among the stockholders. An agreement entered into by the Executive Committee was read, not to make any settlement of the suits commenced, nor to receive any moneys tending to that end, without the unanimous consent of that Committee, indorsed by the stockholders at a meeting called especially for that purpose. The meeting then adjourned.

## Betts Spring Company.

Among the flourishing home industries represented at the Mechanics' fair is that of the manufacture of carriage springs. The Betts Spring Co., the only one here exclusively engaged in this branch of business, make a very handsome display of different varieties of springs made, even more creditable from the fact that many original improvements are incorporated in the work.

All of these springs are made of the best refined English steel, which is imported in long bars, from one and a half to four inches wide, the edges being slightly rounded off, ready to make up. As some may be interested in knowing how these springs are made, a brief description of the process is given. A workman takes the steel bars, and a machine cuts them into proper lengths for the leaves of a certain class of springs. The leaf then passes to a furnace, where the ends are drawn out by a machine, very little finishing being required at the mechanic's hands. Each end of the spring is then drawn out thin, leaving a taper from the center to the ends.

The same machine also puts a "lip" on the leaf. This "lip" is a very important improvement over the old-fashioned way of making light springs, and is an invention of Mr. Betts. Formerly, in placing one leaf above another, it was necessary, in order to keep them in position, to cut two slots and punch two teats in each leaf, which, of course, weakened the spring. Each of these slots was about half an

inch long, and, in making the two in each leaf, the piece of steel was frequently broken, and always weakened. The teat or projection in each side of the center of the leaf fitted into corresponding slots in the leaf below it, thus preventing the leaves from getting out of position. The "lip" invented by Mr. Betts is simpler, and answers the purpose better, without weakening the leaf in the slightest degree. It consists of a slight projection formed on the side of the spring, a short distance from each end. This being formed on each leaf, laps down beside each lower leaf, each one assisting to keep the other in position, and preventing lateral motion. These lips, therefore, do away with the slot and teat, and the springs never give way where the lip is. The machine for forming the "lip" was devised by Mr. Betts.

After the "lip" is formed, and the ends are drawn out, the leaf passes to the grinding room, where the ends are "pointed," and any roughness is removed. The leaves then go to the fitting shop, where they are set and carefully tempered. They are then sent to the finishing room, where the parts that show are finished up and polished. Every spring, large or small, is carefully tested before it leaves the shop.

Most of the machinery for carrying out the different operations has been designed by the proprietors, and is of their own construction. The business has been established on the quality of the work performed, no outside assistance having been rendered, and they have succeeded in introducing these springs almost everywhere on the coast. The works were established here some nine years since, with one man and a boy; now they give employment to a large number of hands and supply all the wagon and carriage makers in this city with springs, as well as

sending quantities of them to the interior and all over the coast.

In the display in the fair are shown the different varieties of springs made by the company, some polished up handsomely for exhibition and others in the form usually sold from the factory. A 200-pound weight is arranged to drop on the springs so as to show their strength. This is dropped from different heights, according to the style of spring placed under it. The springs so tested are taken from the racks at the factory, and not made especially to be exhibited.

Among other styles exhibited is the compensating side spring, which gives good satisfaction to the users. It is a long spring, which, instead of being hung in loose shackles is hung on what carriage makers call two "jacks," on the head works and axle bed. The ends are so formed that as the middle of the spring stretches the ends take up, or rather curve over, and do not push the ends of the wagon apart.

The "compound spring" exhibited was made by the Betts company to suit the special requirements of the Oppenheim buggy, to which it is particularly adapted. This is a "jump seat" buggy; that is, it can be made single or double-seated at will, by a peculiar construction that admits of the hind seat being folded over to the front when not needed, or thrown back so as to be utilized. This style of buggy requires peculiar springs to suit the varying load, as light springs, suitable for carrying two persons, would not be strong enough for four, and if made too heavy would be stiff. To overcome this the compound spring was devised. There is nothing particularly new in it except its adaptation to this class of vehicles. It consists of an ordinary spring, with a smaller sup-

## New Style of Elevator Hoist.

We saw this week at the machine shop of Hawkins & Cantrell, 210 Beale street, a new style of elevator hoist, comprising a new combination of mechanical principles. The hoist was invented by Mr. Hawkins, and a model of it has been placed in the fair, the machine itself, the first one of its kind, being needed immediately by the purchasers, so it could not be exhibited. The apparatus itself is very simple, the only wonder being, as in many other cases, that some one has not thought of the application before. In brief it consists in the employment of a screw shaft having a nut which is caused to travel from end to end by rotation of the shaft. This nut is connected by suitable ropes with drums or pulleys for multiplying the motion given by the screw and to connect with the elevator drum.

The machine just completed at the shop is intended for a wine cellar at Fresno. The elevator cage, guides, rope, pulleys, etc., are not essentially different from those employed in other hoists, and may be used equally well with this device. The screw shaft is horizontal, with journals turning in boxes at each end, the read end being fitted with suitable thrust bearings. The threads in the screw shaft are cut of a pitch sufficient to move a traveling cross-head or nut at the proper rate of speed. In this one the screw is ten feet long, three inches in diameter and one inch pitch, and is calculated to hoist about 3,000 pounds.

The traveling cross-head has a guide or guides, and the ropes from the drum are attached by bolts to the cross-head (which has a brass nutbushing) so that as the screw shaft is rotated the traveling cross-head is drawn outward, the drum and pulley rotated and the cage elevated; when the nut is moved inward the cage is lowered. The screw may be driven in any manner desirable, by belt connection or directly by small engines. A pair of very handsome engines for this purpose were made by Hawkins & Cantrell and may now be seen in the California machine shop where they are being fitted to an old style elevator to go in the new Stock Exchange building. The contract for this elevator was made before the new style was constructed.

The cylinder frame in this hoist is set against the main frame so that it is all solid. By the use of this device the load will stop anywhere without being held by the engine. It is absolutely noiseless, there not being a gear wheel in the machine, so that it is in this respect alone superior to elevator hoists generally. The usual arrangements for stopping and reversing can be used, but the stoppage or start is accomplished without any jar or suddenness, which is usually an objectionable feature in elevators.

Messrs. Hawkins & Cantrell exhibit in the fair one of these hoisting engines for mining purposes, a style in extensive use on this coast in prospecting mines. They are made with a solid iron frame and so arranged that an engine can be put at work in an hour after arriving on the ground. They are heavier and stronger than those of Eastern manufacture, it being necessary in mining work to have them of the strongest material. The smaller engines have vertical boilers with single engine and reel like that exhibited; and the larger double engines, capable of hoisting from a depth of 1,000 feet are made with locomotive boilers. This class of engines being much less expensive than heavy hoisting works are in demand for opening mines.

**PERMANENTLY CHAINED.**—Before leaving for the East as one of the Creedmoor team, Mr. Geo. H. Strong, of the firm of Dewey & Co., was the recipient of a modest-sized but richly ornamented watch chain, containing specimen gold and quartz settings, purchased from Col. Andrew's diamond palace by his partners. Other valuable and equally handsome tokens were also bestowed upon him by partners and employees of the office. Chained, as he has been, to the post of duty for 13 years, with scarcely an intermission, his partners and employees have been enchained to him by his courteous and ever-patient demeanor through long years of business connection. Now chained to them by these parting testimonials of esteem and good feeling, his early return will be earnestly desired and daily looked for. May victory crown him and his comrades, is the hearty wish of every true Californian.

**THE Braidwood, Illinois, miners** have made a proposition to resume work, but no action was taken by the mine owners.

VIEW OF LAKE TAHOE, BETWEEN GLENBROOK AND ROWLAND'S, LOOKING SOUTH AND WEST.

plemental spring fastened to its center above and below, so that with an increased load the supplemental spring takes its part of the load. In this way this extra spring is inoperative until the load is increased so as to bend the main spring down far enough to bring the extra spring into use. Mr. Betts proposes putting this style of spring on express wagons and that class of vehicles in which the weight of loads varies considerably. He calls it the Betts compound spring, and it takes the place of the heavy pieces of rubber usually employed, but which are too rigid and not as well adapted for the purpose as the supplemental spring.

Among other styles of springs made at these works are car springs for railroad cars; also, springs made in two elliptics of 38 leaves, for butcher wagons, etc., calculated to hold from four to six tons. The works of the company are at No. 218 Fremont street, in this city.

## Lake Tahoe.

The engraving on this page, giving a glimpse of the famous Lake Tahoe is copied from a superior engraving in H. F. Williams' standard work, "The Pacific Tourist." The engraving in Mr. Williams' book was made from the celebrated painting by Thomas Moran. We prepare the engraving to illustrate the very carefully written and interesting paper on Lake Tahoe, from the pen of Major J. W. A. Wright, which may be found on page 130 of this issue. This lake is one of California's gems, and, though there may be many who know of its beauties, there are hosts who have not gazed upon its waters, and to whom the description we give will come with gratifying freshness, and create a longing for a visit, which those are happy who have money and leisure to secure.

### The Combination Shaft.

One of the Great Mining Projects of the Day.

The Chollar-Norcross-Savage shaft, or, as it is more generally called, the Combination shaft, is now nearing the level of the Suro tunnel. So near each other have the workings of these two great mining projects come, says the *Gold Hill News*, that the blasts in the tunnel are distinctly heard by the workmen in the shaft. Nor is this very wonderful when it is considered that here remain only about 1,050 feet of rock between the two points, and that the charges used in the tunnel are very heavy, several in number and are all exploded at the same instant of time by electric exploders. The discharges of blasts in the Combination shaft are also distinctly heard in the east drift, 1800-foot level, of the Chollar-Potosi, the distance between the two points being about 900 feet. The tunnel line, it will be remembered, however, is 365 feet north of the shaft.

### A Great Mining Project.

Every day shows more conclusively the wisdom of going half a mile east the main line of the present hoisting works of the Comstock and of sinking a monster shaft perpendicularly to the ledge. Should the general dip of the Comstock be maintained to greater depths, this monster shaft will strike the vein about 2,500 feet from the surface. The same wisdom which conceived the project is being exemplified in carrying it on. Everything is on a scale commensurate with the undertaking itself. Before a spade or pick was struck to even grade off the locality of the present works, preparations for convenient access were made, and a side track from the Virginia and Truckee railroad and a wagon road to the site projected. Then commenced the grand preparations, the plans of which had all been fully matured by I. L. Regna, the chosen Superintendent of the shaft.

### The Site, Shaft, Works, Etc.

The site selected for the shaft was a most eligible one. From it the view of the city is particularly fine. It stands some 200 feet above the bottom of the ravine, and has dump room sufficient for years. The site having been determined upon, a double grade was made, the upper one of about three acres, for the hoisting works proper, and the lower one for the shaft, blacksmith and carpenter shops, etc. The shaft, which was started on the lower grade, is the largest and finest on the lode. The actual excavation is 10 feet 6 inches by 30 feet 6 inches. The shaft, when timbered by 14 by 14 timbers of spruce, has four compartments, three being 5 by 6 in the clear, and the fourth, or pump compartment, being 6 by 7 feet. Its depth is now about 1,550 feet. The main building is 60 by 140 feet, 20 feet high and contains the hoisting and pumping engines. The room is well lighted and easy of access, being on the upper grade, and reached by both wagon road and side track. It extends out over the shaft room and affords ample space for offices when needed at the works.

### The Shaft Room and Shops

Are situated on the lower grade. The former is 40 by 60 feet and 32 feet high, that being the difference in altitude of the two grades. The east side of the room is the wall extending from the lower to the upper grade. This wall is eight feet in thickness at the bottom, 32 feet high, and built of heavy granite. It contains four vertical piers, and is pierced for the shaft end of the pump hob. The carpenter shop is at the southwest corner of the shaft room, is 40 by 80 feet, 16 feet high, and fitted up with the usual facilities for preparing timbers, etc. The machine is run by a 35 horse-power engine.

The timbers, etc., are all dumped from the upper grade, right where wanted. The blacksmith shop is at the west end of the main structure, is 30 by 60 feet, and 20 feet high. It contains two forges driven by a blower. The drying room is south of the main building, and is 30 by 50 feet. The boiler room is north of the main building, is 40 by 50 feet, and 20 feet high, and contains two sets of largest-size boilers.

### The Machinery

Is first-class in every respect. The hoisting engine is geared to 350 horse-power, and is sufficient to do the required work after the lode is reached as well as before. It turns two reels, on each of which are wound 2,900 feet of cable six inches wide and five-eighths of an inch thick. Near the hoisting engine is a double-gear steam winch, or pump-hoist, capable of lifting 80 tons. It moves slowly and strongly, from 60 to 75 feet per minute being its most rapid movements. It has windlass heads on each end, and is used by means of a snatch block for moving heavy objects anywhere about the building. The cable attached is seven inches by five-eighths of an inch, and made by Hallidie & Co., San Francisco, of the best steel wires. It has the strength to handle the pumps to the depth of 3,500 feet.

### The Pumping Apparatus

Is second to none on the lode. It stands near the shaft and has never been used, there being very little water in the shaft. It is, however, all ready to run, and is a vertical compound condenser of 700-horse power, capable of running a double column of 12-inch, 8-foot plunger pumps to any required depth. It is controlled by the Davy differential valve, and can make one stroke in 15 minutes, or 12 strokes in one minute. It is attached directly to the hishop head of the bob. The initial cylinder is 32 inches by 10 feet stroke, the expansion cylinder is 64 inches

by 8 feet stroke. The engines, pumps and bob weigh 150 tons. The beam of the bob is all iron and weighs 52 tons. There are 10 sticks for pump rods on hand, each 15 by 15 and 100 feet long, Oregon pine, and cost here \$300 each. They are the finest sticks ever seen on the Comstock, being as straight as arrows and of the clear stuff. The joints at the ends of these as they go together to form the rod will be cut square and oak keys fitted and driven in so as to make all solid as the native stick. These joints will be still more firmly secured by iron straps 10 inches wide, one inch thick and 36 feet long, one on each side. These sticks are all numbered and bored, and the plates are also numbered and perforated to correspond. In the side of the shaft room panel doors have been placed, one above another, and above a section of the floor made movable for the purpose of handling these sticks for pump rods. The pumps are all on hand ready to be put in.

### The Sheaves, Skeet, Etc.

The sheaves and the construction of the gallow frame are unique and worthy of particular mention. The frame is built upon the top of the stone wall above mentioned. The sheaves are 18 feet in diameter, and so set as to carry the cable over to the center of the shaft below. The faces of the sheaves are eight and a half inches wide, filled with oak wood to prevent crystallization. They are so constructed as to stand the strain of 100 tons each. At the end of the cable, instead of a cage, is found a skeet, an excellent invention of Mr. Regna, capable of holding five tons of rock, and which dispenses with all station tenders, as by an ingenious contrivance it dumps and rights itself. It saves the handling of an immense amount of dead weight. It is still now most of the time, but brings up 100 tons of rock and 16,000 gallons of water daily, and there are required to run all the saws, machinery, etc., and do this work only 20 cords of wood per week. When the works are all completed and in running order, and three of these skeets used, 2,000 tons of rock can be raised per day.

### Miscellaneous Mention.

This shaft is situated 2,327 feet east of the Chollar-Potosi shaft. It was recently plumbed and found to be but one-quarter of an inch out of the way north and south, and one-half an inch east and west, which shows what kind of work Mr. Regna is doing. It is so smooth and straight that the skeets pass up and down without bearing against the guides. The general arrangement of the works is as perfect as any on the lode, and was all planned by Mr. Regna. In bringing the pump rods from San Francisco they were loaded on four flat cars, the weight, however, being borne principally by the end cars. In this manner all the twists and turns of the railroad were made in safety. The rope house is 200 feet east of the main building, so that in case of fire the works will not be endangered. The company own 35 acres of land where the works are situated, and every time the place is visited, the wisdom of the undertaking, and the excellence of the arrangements made by Mr. Regna to carry it out, are made more and more apparent.

### Nevada County Copper Interest.

Down in Rough and Ready township, on the range between Penn Valley and the Round Tent House, is a portion of an extensive copper belt which at the present time is exciting considerable interest among miners and capitalists, and is destined in the near future to receive still more attention. In 1862-3 there were very lively times in the vicinity of Spenceville, and the excitement there became intense on account of the discoveries made in that section. Thousands of claims were located and shafts were sunk on them in every direction. It is said that the whole district for ten miles in width and twenty miles in length was peopled with prospectors who were searching for copper lodes and talking copper. Shares in some of the claims sold for a hundred dollars per foot, and almost any kind of a claim was considered valuable. The ore in all the ledges contained a per cent. of copper that would pay to mine and reduce in Europe, and many of them were said to assay from three to thirty per cent. A shipment of ore from one of the claims to Swansea is said to have paid \$35 per ton above the expense of mining, shipping and reducing. The belt is said to be literally covered with lodes, almost all of which would pay for work if the ore could be reduced at a low cost. In 1863 that desideratum was not reached and the section was abandoned. Some years ago Mr. Deekin, an experienced mining expert and engineer, concluded to experiment upon the ore, and accordingly re-located what was known as the "Well Lode," at Spenceville. He expended considerable money and a good deal of time, but did not achieve satisfactory success. He was succeeded in the management of the property by Mr. C. Borger, a thoroughly scientific and experienced miner, who has, by repeated experiments and continued practical work, at last demonstrated, beyond a doubt, that copper mining can be successfully and profitably carried on in that section. The property is owned by an incorporated company known as the San Francisco Copper Mining Company. They own 3,000 feet of ground. The lode at the depth of 30 feet is at some places 125 feet wide. The ore averages, by working process, about six per cent copper. The balance is composed of iron, sulphur and zinc, in about the following proportions: 40 per cent iron, 45 per cent sulphur, 2 per cent silica, from 2 to 4 per cent zinc.

Mr. Borger has so perfected his method of working that \$51 can be realized as profit from every ton of ore raised and reduced. Last month the expenses of the company were \$2,500. They extracted 22 tons of copper, that sells from \$300 to \$320 per ton in market, which, as readily will be seen, affords a nice profit. To obtain this result there were only 25 tons of ore reduced per day. The works will be enlarged inside of 60 days, so that 40 tons per day can be worked. All that is necessary in order to obtain any given amount of money per day from these claims is to figure how many tons of ore it will require and then extend the works so as to reduce that number. The ore body is practically inexhaustible and will increase in value as it is sunk upon without a doubt. The Superintendent informs us that the ore in his ledge is the lowest grade of any in the district, but it has the advantage of being the largest, and as it can be worked at a nice profit, is perhaps the most valuable. The process by which the ore is now successfully worked by Mr. Borger is not claimed to be a secret, but only a successful one for reducing this class of ores. It is rude, but cheap and effective, and to Mr. Borger the county is indebted for guaranteeing the certain development, in the near future, of one of the most important interests within its boundaries. The ore is raised by means of steam hoisting works from a perpendicular shaft to a tramway about 20 feet above ground.

From there it is pushed in cars to the ore or roasting house—a large building, we should think, 250 feet in length and in the neighborhood of 40 feet in width, the sides of which are not inclosed. Here the ore is dumped into heaps of about 30 feet in length, 10 or 15 feet in width and six or eight feet high. There are two rows of these in the building. In the center of the heap is a brick flue. Brush and wood is placed under the ore and set on fire. In ignites the sulphur contained in the mass, which burns until the heap is thoroughly roasted. It takes about four months for a heap to burn out. From the roasting heaps the ore is taken to a vat house on the side hill above, where it is dumped into a series of vats and submerged in water which is heated to a boiling temperature by means of steam. The liquor from these vats is conducted automatically from point to point till it reaches large revolving tubs, in which are placed scraps of old iron which precipitate the copper. The pulp is then taken out and put into drying pans, when the work of reduction is complete. It is proper to state that the heated water does not extract but little above half the copper; while in the vats, so it becomes necessary to dump the residue into a pile and still further leech it. From this dump-pile a continual stream of liquor runs which is strongly impregnated with copper, and which is conducted into the revolving tanks by the same means as the liquor from the vats. From this source a continual source of revenue is obtained whether the other part of the works is running or not. In other words, a new mine is being formed all the time which will yield a steady profit at no cost whatever. The ore is mined and raised to the surface on a contract for \$1.10 per ton, and the contractors furnish all their own supplies. When these facts are taken into account it will readily be seen that copper mining in Nevada county is destined at no distant day to become one of its most important interests. The field is extensive, and the success of mining there is beyond question since Mr. Borger has discovered a way to work the ore successfully. His method, as said before, is no secret, and he promises to explain it fully to any who desire to engage in working lodes in that district. The works can be erected at a very small cost compared to the expense of erecting works for operating a quartz mine, with the additional advantages of a certainty of a liberal profit and a lasting permanency. It will not be a great while before that section will be the liveliest and most prosperous part of the county. —*Nevada Gazette*.

### A New Mexican Process.

We condense the following from an article in the *Federalista*, a Mexican journal, translated by Mr. A. Leon Cervantes for the *San Luis Obispo Tribune*, on a new process for reducing metals:

Three years ago, Senor Ignacio S. Portugal came from the interior (State of Jalisco) to demand a privilege for a system of reducing metals, invented by himself. Said system obtained the approval of several of our most distinguished metallurgists, to whom Senor Portugal explained his system. It was then seen that the principles on which said system was based were perfectly adjusted to the data of science; the only thing wanting was to search in practice the confirmation of the theory, that is to say: to prove that the imagined apparatus corresponded to the proposed object. The press then occupied itself several times in this important business, and also published satisfactory reports of competent persons in the matter.

Having obtained the respective privileges, Senor P. proceeded to assay his system; but, as frequently occurs, he met with unexpected difficulties, by which he comprehended that the hard task of his scientific observations had not ended. Nevertheless, instead of dismaying at such obstacles, he attacked them with indomitable energy, succeeding finally, after two years of unremitting studies and experiments, in seeing his efforts crowned, and the problem which has been the thought of all his life, resolved. The following report by persons, whose scientific authority no one doubts, is the best support that

can be conferred on the new system, which, already perfected by its author, is destined, as we have said before, to exert an incalculable influence for the good of our country. Indeed, by Senor P.'s method, ores whose reduction can not be profitable by the methods now in use can be treated profitably. As the action of the fire is limited to heating only and not to smelting, it follows naturally a considerable economy in combustibles. The rapidity with which the reduction is made, the nature of the substances employed to make it, the instantaneous amalgamation, the loss of no precious metal, the utility of all component metals, and many other incalculable advantages of this system demonstrate very clearly the great economy in time and money that can be introduced in the mineral industry, and, of course, the vast development of which this industry is susceptible.

### Report.

"Invited by the Citizen Ignacio S. Portugal to examine his system of reduction of argentiferous ores, we visited his laboratory and were much pleased to see the results he obtained."

"The said system consists, 1st. In the transformation of the sulphurets into oxides and in the reduction of the latter to metals. 2d. In the amalgamation of the metals reduced. 3d. In the separation of the same.

"The first operation is effected in a furnace invented by Senor P., of which we examined a well detailed model. In this furnace the transformation and reduction of the ores can be made very rapidly and at a temperature very inferior to the one that would be necessary to smelt them. To this circumstance, which implies a great saving of combustible in comparison to the ordinary smelting system, we ought to add that the condition of the furnace permits that the reduced minerals, in cooling, cede their heat to those entering afterwards into the furnace. Some of the advantages that we find in this system of reduction consist in the facility with which the sulphur of the sulphurets can be bad; and there being no fusion of the mineral, there is no loss of precious metals, as it happens in the ordinary reduction by fire."

Senor Portugal submitted to our examination some portions of mineral ready prepared by his system, and we saw with satisfaction that the reduction had been perfect, as we had only to wash the earths with a little water to separate the various metals which formed the bases of the compounds previously existing in the mineral. The amalgamation of the ores so reduced is instantaneous and complete; the mercury gathers with the greatest facility all those metals capable of amalgamation. We examined afterwards the mass of metals and the remaining dust. In the former we could recognize gold, silver, lead, copper, zinc and antimony, and in the latter we could not find any vestiges of precious metals.

Senor P. showed to us various methods by which he could separate easily and economically all the compounds of the amalgam. It is here where we saw the most notable advantages of this system, as not only the precious metals can be obtained, but also those we mentioned before, which are lost in the other systems. Senor P. separates the iron which is not capable of a direct amalgamation by a physical operation easily executed.

These are briefly the experiments that we saw in practice which demonstrated to us that the author of this system, with an unexampled fixedness of purpose and self-abnegation, has worked for a long time to perfect the metallurgical method which he tried to plant some time ago. The chemical theory of the new system is rational and the experiments in accordance with its indications. Senor P. has made a laborious calculation to demonstrate the economy in time and money found in his system above all others.

City of Mexico, March 8th, 1877.

A FOLDING BOAT.—A few days ago a new and ingeniously constructed portable boat was launched and tested on the Clyde. The boat, which is eight feet in length, and two feet eight inches in breadth, is composed of hickory wood and constructed in such a way as permits of its being folded up till it assumes the appearance of a somewhat large traveling case. When packed it contains the oars, seats, canvas covering, with sufficient space left for other necessities, and as the whole weighs but little over 56 pounds, it can be easily carried about from place to place. Before being put in the water, the frame of the boat is drawn out to its full length, and covered on the bottom and sides with a strong water-proof canvas covering. The process of unpacking and fitting the boat with its covering ready for the water occupied only the space of three minutes.

WORKING THE FLUE DUST.—Everything is moving along very smoothly at the Lemmon mill. The lessees were very much annoyed when first starting up by the constant breaking down of parts of the machinery that had become impaired and rusted by long disuse. This not only necessitated frequent stoppages, but also a largely increased money outlay. Messrs. Clark & Wallace's indomitable perseverance has triumphantly overcome all these obstacles and the process is an assured success, and is another element in Eureka's continued prosperity. —*Eureka Sentinel*.

## Pavilion Garden.

## Fruits, Flowers and Rustic Work.

We are pleased to observe that continual additions are being made to the fruit and flower departments of our highly praiseworthy and good-effecting Mechanics' exhibition. R. B. Woodward displays in a glass case four interesting specimens of the insectivorous *nerpethes* or Pitcher plant, viz: *Darlingtonia Californica*, *N. Saraceniana*, *N. distillatoria*, and *N. ampullacea*. About twenty species of these remarkable and attractive plants are known, by far the greater part of which are natives of Borneo, Sumatra, and the adjacent islands of the Indian Archipelago. The oddity of the foliaceous organs in this genus, with their curious terminal, pitcher-like appendages has attracted great attention among botanists. The size and shape of the pitchers vary much in the different kinds. One sort has the blade of the leaf eighteen inches long by seven or eight broad, and the pitcher twelve inches long by six in diameter, of a broad ampulla form, with two fringed wings in front.

The two tables of cut flowers, one from Miller, Sievers & Co's exotic garden, near Woodward's Gardens, and the other from Thos. Saywell's conservatory, Lombard street, embellish and enliven the horticultural department greatly, with the beautiful and gorgeous blooms of gladioluses, dahlias, fuchsias, roses, etc., and other rare and lovely plants of many varieties on several stands. And what infinite profusion, and what marvelous variety of forms and colors, habit, flowers, leaves! What human imagination, so fertile, so capricious, as it may be supposed, would have dreamed these thousand shapes of leaves, these continual contrasts of aspect and shades of color, the inimitable elegance or the nameless oddity, prodigies of Nature, which science shows to us, are subjected, even in their most fantastic variation, to simple and immutable laws.

On the entrance platform is shown a very extensive collection of handsome and very ingenious rustic work, by T. Duffy, corner O'Farrell and Leavenworth streets. Here are beautiful jardinières of all sizes, shapes and prices. Tables, chairs, sofas, lounges; hanging corner and side baskets, and every variety of rustic and root works; vases, fountains, whatnots, and all other styles of this free and elegant mode of working up the natural wood of many colors, graining and variety of shapes. All this rustic work is mounted on castors; can be moved with ease, and are water tight, and can be watered in the hall entrance or parlor without soiling anything. Conservatories, gardens, summer houses, and hay windows can be thus furnished with all these and many other kinds of ornamental rustic works, and fern cases of any size. Especially is it appropriate for a real rustic house or cottage to have rustic ornaments, even at the threshold; but this ornamentation is appropriate, in some parts of every villa residence.

From Garey's semi-tropical nurseries both fruit and trees of the famous Garey's Mediterranean sweet-orange are shown at the stand of R. J. Trumbull, sculpsman and florist, Sansome street. Some of this fruit is preserved in bottles of alcohol, and is very fine and large. Here also may be seen several sorts of the highly valued and lately introduced fruit of the Japanese persimmon (*Diospyros Kaki*).

The *Journal of Commerce* makes a most extensive and miscellaneous display of the productions of the whole Pacific coast, but especially of California. Here is an example of the vast possibilities of this coast and State, and the belief will suggest itself to the visitor that all the wonders of our prolific land have not by a great deal been yet revealed. Most of the specimens of fruits and vegetables are very large and handsome—the fruits especially are very beautifully colored. Some mountain peaches from Mr. Perry, near Murphy's, Calaveras county, struck us very forcibly, from their great size, brilliant coloring and remarkable juiciness, exceeding in this respect our Sacramento peaches, although we cannot say that their flavor to our palate, was much better than the lowland fruit of that kind. There were four kinds of them, two being George the Fourth and Honest John. Their delightful aroma attracted particularly our notice. Dr. Stivers was again on hand with his specimens of the many beautiful woods of the whole Pacific slope.—E. J. Hooper in *Fair Daily*.

**DEMOLISHED.**—The work of demolishing the old Jackson furnaces is proceeding rapidly, one of them having been already taken down, and the other will probably be raised to the foundations this evening. The intersects of the stones comprising the furnaces are filled with lead, and every open space in the walls permeated with the bullion. On the rocks taken from the furnace, depositions of pure arsenic are also found in considerable quantities. There is no doubt but that the company will be rewarded with a large amount of base bullion, as the quantity in sight is very large, and when the foundations are reached, a deposit that has leaked through the bottom of the furnace will be met with. In the first attempts at smelting in Eureka, patent bottoms were unknown, and a large quantity of the base and precious metals were lost through the imperfect construction of the furnaces. The Jackson company contem-

plate the erection of a first-class furnace in every particular, but it is probable that they will abandon the old site, the dump room for slag being insufficient. It is the intention of the company, providing they can secure control of the proper amount of water needed, to build on Ruby Hill, in close proximity to the mine. Much of the material in the old furnace can be utilized in building the new one, and it is calculated that the cost of transporting ores from the mine to the furnace will be saved, making quite a difference in the economical reduction of the ores. The Jackson will soon be adding its quota to the bullion product of the district.—*Eureka Sentinel*.

## DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

Office—202 Sansome St., N. E. Cor. Pine, S. F.

**PATENTS** obtained promptly; Caveats filed expeditiously. Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted. Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing. The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of widely circulated, first-class Journals—thereby facilitating their introduction, sale and popularity.

San Francisco, 1877.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

### BY GUIDO KUSTEL, MINING ENGINEER and METALLURGIST.

**Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick-silver.** 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

### OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

## ARITHMETIC MADE EASY.

## ROPP'S EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Blue Wagon Bins, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on the tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Scale, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipt by express. Address

DEWEY & CO., San Francisco.

### UNITED STATES

## Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statute and Change of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold postpaid, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

## Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Land in California; Counties and Their Products; Statistics of the State at Large.

**Instructions of the U. S. Land Commissioners.**—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College; Scrips; Pre-emptions; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

**Abstract From the U. S. Statutes.**—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys Land for Pre-emption, List of California Post Offices. Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S. F.

## Questions of the Times.

### Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

### Which is the best American watch?

The New York watch, made at Springfield, Mass.

### Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be the most desirable.

### Why is the New York Watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

### Which is the cheapest watch?

The most economical is the New York watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

### Where can I get a New York Watch?

By addressing the long established, practical Watch makers and Jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Geo. Sam. Rice," "Chas. E. Hayward," "Aaron Baggs," "Theo. E. Studley," "Chester Woolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

**SAMPLE COPIES.**—Occasionally we send extra copies of this paper to those we believe would be benefited by subscribing for it themselves, or who are willing to hand the paper and speak of its merits to others. We call the attention of such to our prospectus and terms of subscription.

**APPRECIATION ABROAD.**—We copy the following from the *Mining and Monetary Gazette*, of London, England: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of *The Gazette*, the full text of the 'United States Mining Laws and Instructions, by the Commissioner of General Land Office, taken from our talented contemporary, *The MINING AND SCIENTIFIC PRESS*, of San Francisco. The documents have now been issued in a handsomely bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very useful to those already interested in American mines, and to others who may be tempted to embark in that enterprise in the States."

Continued from page 133

from the mine, there can be no legitimate excuse for delay in paying the employees for their services; and as it has been fully demonstrated that they will not work without prompt payment, we trust that the company will see to it that when the 10th of the month comes round, the money will be forthcoming. The prospects of the mine are all that could be desired, and we are informed that no effort will be spared to make it yield handsome returns to its owners.

**AUTRAIS COUNTY MINES.**—*Cor. Idaho World*, Aug. 24: Under the management and supervision of Superintendents Pettitt, Lantis and Algehr, of the Monarch and Buffalo companies, operating on the famous Atlanta lode, the opening up of these rich and extensive mines will eventually yield a handsome revenue to the companies. The Buffalo company have started up their mill dry-crushing, their furnace being complete. Will commence operating on next Monday. Every one feels jubilant over the prospect of the furnace working successfully. The company working on the John Simmons ground, west of the Buffalo, is a wealthy Pennsylvania oil company. Capt. Bledsoe is their Superintendent, and is down with the working shaft 50 feet, and found some ruby silver ores that are rich, together with smelting ores that will go \$200 per ton. This company will sink 300 feet, cross-cutting the ledge every 50 feet. Here at Rocky Bar mines are assuming a lively appearance, owing to the many heavy-laden freight teams arriving daily with goods and machinery for Atlanta. The Rollins company, working on the Confederate and Golden Star mines, have about 20 hands employed, and are doing well considering the many obstacles.

## Montana.

**ANOTHER ARASTRA.**—*Butte Miner*, Aug. 18: We learn from one of the proprietors that the new arastra of Supernant & Mercant, on the Little Deer Lodge, about seven miles from town, commenced work for the first time on Monday, the 6th inst., and has since been running in tip-top style. This arastra is driven by a 20-foot overshot wheel, has two beds, each 12 feet in diameter, and one pan and settler. As high as five tons of ore have been worked with it in one day, but this was of ore softer than the average. It is thought that four tons per day will be about its every-day work, and at that figure it will about equal a five-stamp mill. It will be employed altogether in custom work, and is now at work on some ore from the Twin Stevens lode, while there is also some from the La Plata on hand waiting its turn.

## Oregon.

**CINNABAR.**—*Oregon Sentinel*, Aug. 22: "A party, composed of Henry Kippel, T. B. Kent, John S. Miller and G. W. Holt, will start for the cinabar district this morning. Mr. Holt goes out to do the brick work, preparatory to setting up the retort, and everything will be in running order by next Saturday. The company has about 10 tons of ore out, which is expected will yield about five tons of quicksilver. A force of men will be steadily employed in getting out ore as soon as the retort is in working order.

## Utah.

**BEAVER DISTRICT.**—*Cor. Salt Lake Tribune*, Aug. 24: The town of Shantite is almost deserted, although the mines are not. Most of the Shantites have gone to Lake Panguitch, the Yosemite of Southern Utah. It is estimated that there are 150 persons now sojourning at the lake, distant 60 miles southeast from Beaver, and a most enjoyable place during the heated term. The mines are looking well and improving. The Millford furnace has shut down, and no doubt will remain so until lead advances.

**FRISCO.**—The new Godbe & Co. smelter is completed and is ready to start. It is complete in all its arrangements, and reflects credit upon its builders. The machinery is of the best and latest pattern. Large piles of calcined ore lie on the dump, awaiting reduction. The Horn silver mine still increases in size and richness.

## Affairs at Eureka.

The decision in the Eureka Con. vs. Richmond case, which we gave last week, has had the effect of causing a revival of mining affairs in Eureka, as was expected. The two idle furnaces of the Eureka Consolidated have been put in shape for work, and more men will be employed. A large number of these men, who have been idle for some time, have been in the town for the past six months. The *Sentinel* says their number has been augmented by fresh arrivals from outlying districts, and there are at the present time at least 1,000 idle men in the town, awaiting the resumption of operations at the mines and furnaces. About one-half of these will be added to the pay rolls within the next month, and will make an aggregate of about 1,000 miners and furnace men employed in the district. This will turn loose in the neighborhood of \$120,000 monthly, which amount, added to the coin circulation, will infuse new life into the arteries of trade and business.

Both of these large companies have been of great benefit to the camp, and it made little difference to whom the land belonged so long as it was worked and gave miners employment. The Richmond is still a good mine, notwithstanding the loss of the Potts chamber, and there is plenty of ore yet to be worked, so that the mine will no doubt soon be in full blast again. The Eureka Consolidated now being free to take ore from the ground formerly in dispute, will work the 9th and 10th levels energetically. While prospecting during the continuance of the injunction they found a rich body of ore on the 10th level, and which now belongs to them. It is estimated that they will extract 1,500 tons per week, with plenty in sight.

The suit determined the ownership of the disputed ground, but the Eureka Consolidated company will, it is said, sue for \$2,500,000, the value of the ore claimed to have been taken from the Potts chamber. This suit will probably be tried by jury. The Richmond company will appeal the case to the Supreme Court, but the appeal will not stop operations at the Eureka Consolidated mine, as they will furnish bonds for any damage likely to accrue.

The Ophir mining company to-day entered suit against Mrs. Cooper for the sum of \$2,800 damages, for the unlawful appropriation to her own use of lumber and paint belonging to the Ophir mining company.

## Miners' Union and Mining Companies.

We recently stated that the Miners' Union, of Virginia City, had issued an order that no one not belonging to the Order should be permitted to work in the mines underground, after September 10th. It was apprehended that this order would lead to trouble and disorder. The miners and superintendents, however, have held two joint meetings to discuss the proposition, and it was agreed that none but Union men should be employed in the mines; and when a man is hurt while at work, the company will not be called upon to defray any expenses for physicians or hospital treatment. The *Virginia Chronicle*, of Monday, gives the following account of the meeting:

At three o'clock yesterday afternoon an important meeting was held in Miners' Union Hall, composed of the committees from the Miners' Unions of Virginia, Gold Hill, and Silver City on the one hand, and of the principal Comstock mine Superintendents on the other. Among the latter were Colonel James G. Fair, of the Consolidated Virginia and California; William Hardy, of the Ophir, F. E. Osbiston, of the Gould & Curry and Best and Belcher; Colonel M. G. Gillette, of the Savage; Philip Deidesheimer, of the Hale & Norcross; Frank Thayer, of the Julia; Isaac L. Requea, of the Chollar and Combination shaft; E. A. Shultz, of the Bullion, Exchequer and Justice; W. H. Smith, of the Belcher; Captain Matt Canavan, of the New York; W. B. Sheppard, of the Utah; Charles Bonnemont, of the South Nevada; Jasper Babcock, of the Leviathan, and some others whose names we did not ascertain. The meeting was held in secret, none being admitted except members of the Miners' Committees and the Superintendents, and since the meeting it has been very difficult to obtain any information. We are informed, however, that the meeting was held at the request of the Superintendents, who wished to take such steps as might be feasible to prevent any trouble arising out of the order recently published by the Miners' Unions, namely, that, after the 10th of September next, no person not a member of the Union, would be allowed to work as a miner under ground, except foremen or Superintendents. There was a lengthy discussion on the matter, in which good feeling and a desire to effect a fair and amicable settlement were shown on both sides. Finally, the desired object was accomplished by an agreement on the part of the Superintendents that, after the 10th inst., they would discharge from the mines any miner reported to them as not being a member and refusing to become one. It is a source of gratification to everybody that this matter has been amicably settled, and it was a wise course to take time by the forelock and bring about this meeting whereby a concert of action is secured. Otherwise, by the action of some single hot-headed Superintendent, or by imprudent conduct on the part of individual miners, a condition of ill feeling might have been brought about which would have resulted in no good to any one.

## Aaron's Process in Mono County.

**EDITORS PRESS:**—In reference to the article on "Mono county mines," in your issue of the 18th instant, I wish to state that the editor of the *Inyo Independent* formed his conclusions somewhat too hastily from remarks of my own. The failure of the Aaron process to work the ores of the Diana mine, for the past year or two, was owing to the want of knowledge of the operator. I am now working ores of \$431 per ton, and the tailings average \$18 only, and might easily be made poorer. The bullion is from .960 to .990 fine, from ore carrying 30 or 40 per cent. of copper, with some lead and considerable antimony. The only troubles arise from the very depressed state of the company's finances, caused by the fact that some \$20,000, which should be in the treasury, is in a pile of tailings, where, though not irretrievably lost, it is not immediately available in the purchase of the material and machinery required.

I have not enough barrels to amalgamate the rich ore as fast as the stamps can crush it; quicksilver is scarce, and the separator is so poor a machine that I have not been able to make it work satisfactorily. C. H. AARON.  
Benton, Mono County, Aug. 22d, 1877.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Grand Prize, Aug. 23d, \$11,500; Northern Belle, 21st, \$6,405.67; Endowment, 24th, \$2,699.18; Gen. Thomas, 21st, \$460; Tybo Con., 21st, \$3,827.41; Northern Belle, 23d, \$8,301.65; California, 25th, \$205,415.96; total to date, \$768,969.80; Con. Virginia, 25th, \$234,191.77; total to date, \$696,761.71; Tybo Con., 23d, \$8,331, total to date, \$33,235; Martin White, 22d, \$8,470.04; Standard, 26th, \$29,917.58; Arizona, 26th, \$2,393; Endowment, 29th, \$3,020; Grand Prize, 27th, \$18,000; Leopard, 27th, \$6,800; Tybo Con., 25th, \$4,230.80; Northern Belle, 26th, \$10,590; Con. Virginia, 29th, \$157,912.84; California, 29th, \$156,953.44; total, \$314,866.33. The total for the month is: Con. Virginia, \$354,674; California, \$925,923.

## Mining Decisions.

The Supreme Court of the State of Nevada, in the case of the Golden Fleece G. and S. M. Co. vs. the Cable Consolidated G. and S. M. Co., the decision on which is published in the *Enterprise*, held that a proper construction of the Act of Congress confines the location to a portion of the ledge covered by the surface boundaries, so that if the ledge should be found to cross the surface, the locator will be limited to the number of feet actually within the location; that is, if, in a claim 600 feet wide and 1,500 feet long, the ledge should cross the claim at right angles, the claimant will take only 600 feet, instead of 1,500 feet. This view of the law necessitates the locator desiring to acquire a right to 1,500 feet, to ascertain, before making a location, the exact direction of the ledge, and to have his surface boundaries include the ledge for the whole number of feet; otherwise the amount of ground not included will be lost to him.

Judge Cole, of the Sixth District Court of Nevada, has made a ruling of considerable importance, which we find in the *Eureka Sentinel*, as follows: In the case of the Emmet Consolidated mining company against Delay et al., in the District Court, this morning, the attorney for plaintiff appeared and moved to transfer the case to the United States Circuit Court under the statute. The Court immediately, of its own motion, instructed the clerk to enter an order dissolving the injunction against defendants. The Court said that hereafter no party would be allowed to make a stepping-stone of the District Court to obtain a provisional remedy and then transfer the case to the United States Courts, and thereby continue the operation of the remedy, perhaps to the prejudice of the other party. The order of the Court took the attorney greatly by surprise. The Court, however, stated that at the time of the transfer of the Eureka Consolidated against the Richmond, he had made up his mind and announced his intention to pursue such course in the future, and declined to reconsider the order in the present case.

## Edge Tools.

Among the many meritorious collections of home manufactured articles in the pavilion, none deserve a more careful inspection, more decided expression of praise, than that of edge tools, by W. F. Palmer. The making and tempering of edge tools for our mechanics is one of the most necessary, and at the same time most difficult manufactures we have. A good shaped tool, well tempered, is half the battle in a hard day's work, and California mechanics are noted for the generosity with which they will part with money where the object to be attained is an improved article used in their everyday labor.

We have read a great deal about the temper of the blades of swords, battle-axes and lances of "ye olden time," bow they used to cut down through iron headpiece, corset and mail armor, how they would bend double without breaking, but such steel, or such iron, or such tempering has never come within our immediate observation. Mr. Palmer comes as near to it as is necessary for practical use, as most of our carvers and hewers now take good care not to hack and slash at iron pots and plates of boiler iron with anything keener than a cold chisel. His tools are all finished and tempered with his own hand, as he is not yet possessed of the capital to run a large business, and this is the best guarantee of their excellence. Nearly all our ship carpenters, caulkers and other mechanics along the wharves now get their tools made by him, and he never loses a customer who has once given him a trial. His collection on exhibition embraces broad-axes, chisels, drawing-knives, adzes, chopping axes and hatchets, and all such tools generally, and are polished up like mirrors. Give him a call, country mechanics, and thus extend his area of usefulness. His workshop is on Berry street, between Fourth and Fifth.

THE Fish Commissioners have caused the arrest of eight violators of the law which forbids the taking of salmon from our rivers at this season of the year. Detectives have been sent to investigate the Sacramento river canneries, as complaints have been made that the conductors take out the young fish along with the mature. The Sacramento and San Joaquin rivers are now abundantly stocked with salmon, and if the laws are properly observed the supply will never fail. The shad have done as well as the salmon, and in a few years the bay and streams will be amply stocked with fish of this kind. The Commissioners successfully transported from the East about 106,000 young shad this season and placed them in the Sacramento river. During the season about 1,000 shad, weighing from three to five pounds each, have been accidentally taken out in the nets of fishermen.

THE London *Financier* says: According to private advices from Lyons, several failures have occurred in the silk trade, including one for \$1,000,000.

## PATENTS AND INVENTIONS.

### A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., August 7th, 1877.

FOR WEEK ENDING AUGUST 14TH, 1877.

TICKET ENVELOPES.—James H. Culver, S. F.  
TOILET MIRRORS.—James G. Divoll, Sonora, Cal.  
CUT-OFF SLIDE FOR CUBE SUGAR MACHINES.—Luder Hopken, S. F.  
DRAFT TIPS FOR VEHICLES.—Arthur Marshall, S. F.  
WHIFFLETREES.—Albert Hayes, Petaluma, Cal.  
ROTARY WATER METERS.—John Simons and George Wallace, S. F.  
MACHINERY FOR CUTTING AND PRESSING SUGAR INTO CUBES.—William Jasper, S. F.  
TRADEMARK.  
SHOES.—Maynard & Jones, S. F.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**CUT-OFF SLIDE FOR CUBE SUGAR MACHINES.**—Luder Hopken, S. F. The object of this invention is to provide an improved cut-off slide to be used in machines for making cube sugar; and it consists in the employment of an inclined or wedge-shaped slide, gradually thickening from front to back, and having similar shaped sides. The plate, or slide, cuts off from the sugar in the hopper, or receiver, the amount necessary to fill the molds without pushing out a quantity or packing it solidly. This device may be employed upon any machine in which a cut-off slide may be needed, and the inclines will serve as a compressing device to compact the sugar into the molds without other stamps.

**TOILET MIRROR.**—Jas. G. Divoll, Sonora, Tuolumne county. This is a novel method of combining one or more adjustable mirrors with a stationary mirror for toilet purposes. A strong rod projects from above a stationary mirror to a distance in front of it. To the outer end of the rod is a cup or other device to support the adjustable mirrors. Each mirror is suspended from one end of a curved rod, the opposite end of which is supported by the cup, so as to be swung in a circle. This arrangement of the mirrors is especially adapted for toilet purposes, as, by shifting the adjustable mirrors, a person standing in front of the fixed mirror can see every part of the head.

**TICKET ENVELOPE.**—Jas. H. Culver, S. F. This invention relates to a ticket or card envelope, which is so constructed that one entire side forms a flap or leaf, while the opposite side forms an open-faced ticket or card holder, so that the flap or leaf can be opened to expose the face of a ticket or card to be inspected or exhibited without removing it from the envelope or disturbing its position. The arrangement adopted forms a cheap and simple ticket envelope which will be very convenient, as the holder of the ticket need never remove it from the envelope. He can exhibit it to a doorkeeper by simply raising a flap or leaf so as to expose the face of the card, thus preserving the ticket in a clean or neat condition.

**INDIANS IN THE BLACK HILLS.**—A dispatch from Deadwood, dated the 25th, says: The party of twenty persons who left here about two weeks ago for Little Missouri river returned to-day. They report that on last Tuesday afternoon they discovered Indians close to them. They selected high ground and dug rifle pits. They had been digging about twenty minutes when nearly 500 Indians appeared on a bluff opposite, about 400 yards off, and commenced firing at them. The fight lasted nearly four hours. Thomas H. Carr, quartz recorder of Deadwood mining district, was shot through the head and killed. After dark the Indians withdrew and the miners escaped, being obliged to walk 150 miles to reach this city.

**A MINING PHENOMENON.**—James McCann informs us, says the Reese River *Reveille*, that the sulphuret ore in the Patriot mine, at a depth of 450 feet, has given away to chloride. This is something very unusual in ledges in this section, for chloride to come in at so great a depth, and is the first instance of the kind of which we have any knowledge. The ledges of this district, and those immediately adjacent, carry chloride ore at and near the surface, which gives out and is replaced by sulphurets at the depth where water is encountered. The chloride from the Patriot is brown in color and looks to be rich.

J. E. P. WEEKS, for over 20 years news editor of the Sacramento *Union*, died at Sacramento on Tuesday.

THE California team went East on Thursday morning to compete in the rifle-shooting match at Creedmoor.

## California Products at the Fair.

On entering the pavilion one may almost immediately see at their right the fine display of California and Pacific Coast products made by the *Journal of Commerce*. It is all of California production, we believe, except some fine woods and some few other articles. It is a stand 30 x 15 feet, pyramidal in form, having ranged upon it numberless bottles of wheat, oats and barley, samples of broom corn, ears of corn, specimens of the fiber of flax, ramie and hemp, tobacco of the finest leaf, bolls of cotton, manzanita wood of mammoth size, a section of fir tree, cactus wood and paper, and a tree of it 15 feet high, cocoa nuts, and coriander made from it, Tahitian bread fruit, wild oats from Souma nine feet high, a broom eleven feet long, and many other such articles.

In the vegetable line are mammoth beets, cabbages, potatoes, carrots, melons and squashes of forty pounds weight, go far toward convincing eastern visitors that all is not lying that is said of the wonderful growth of our vegetables.

The display of fruit is unequalled by anything ever before shown in our State or elsewhere. E. Runyon, of Sacramento, sends the finest and largest of peaches; Malaga, Muscat, Tokay and Malvoisio grapes of beauty and size incomparable from R. B. Blowers, of Woodland; Alexander apples of near two pound's weight from Briggs orchard, Marysville; figs, peanuts, walnuts, etc., from D. Conrad and others. Of dried fruit, fine fruit dried by the Aldeu and Walter processes of all kinds are there in abundance.

Twelve different kinds of tropical and semi-tropical fruits grown in California, Mexico, Central America and the Islands are shown, the most notable of which are the Shaddock, a species of large orange. B. F. Wellington shows 30 different kinds of seeds.

Of minerals, we have here shown iron, antimony, salt, sulphur, 40 gold and silver bricks, and also white and colored marble, etc., and a glass show case full of candy from Ebernfors & Rothschild's factory.

In the line of animal products we are first attracted by the wool exhibits, which have been prepared with great care, possess a fine silky fiber, and are a credit to the State producing them. Falkner, Bell & Co. submit a couple of show cases filled with samples from different sections, principally the northern portion of the State and Oregon. Henry P. Flint shows some beautiful samples, while B. P. Flint has on exhibition a splendid fleece. E. P. Bailey, of San Jose, contributes some magnificent goat skin robes, one of a delicate creamy white, the other of a cherry color. A case filled with cocoons of California silk, presented by R. B. Prince, shows that our claims in the matter of silk production are not altogether mythical. A pyramid of salmon from the cannery of Emerson, Corville & Co., on the Sacramento river, shows that our State may boast this delicious fish as well as Oregon.

The display of cactus and its product, paper, is quite lavish, and novel to many, as there are some who had no idea that cactus ever grew to such proportions as the log of wood shown would indicate. Withal it is a fine showing for so hastily prepared a collection.

## Hanging Material.

If the California Cordage Company had the exclusive right to hang every scoundrel in the United States, they could supply the rope to do it with out of their exhibit in the pavilion. In fact we have no serious reason to doubt but that the majority of them might be strung on the one great oil-boasting cable they have in the fair. What a wonderful improvement there has been in this one industry on this coast, in the last ten years or more. Any one who has never seen the present use of machinery in the "rope-walk," ought to solicit the privilege of going through the factory. Their display consists of three-inch hawsers of tarred rope, double twisted bawlers, hard and firm, for use in oil wells, hale rope, clothes line, and all the common sizes and kinds of rope for the various uses of agriculture, mining and mechanics. They have also a large, long tress of the raw material as a center piece, that might do duty at a masquerade as the flaxen tresses of a Saxon giantess. The capacity of the factory is about five million pounds and sufficient to more than supply the demand for the whole Pacific coast trade. It is located at the Potrero, near the Southern Pacific depot, and employs about 100 hands. The office and salesroom is at No. 611 and 613 Front street, where they have a large two-story building stored with the product of the factory, and by telegraph to the latter can fill any special order at twenty-four hours notice.

Messrs. Tubbs & Co. are making rope from two different materials, according to orders and the uses required. Sisal hemp or Maguery plant, and Manila. Of course they can make from any required material to suit purchasers. Patronize your home manufacture, and thus give employment to our own population.

APPREHENSION exists in Washington that Texas may act independently regarding border outrages, and thus complicate our relations with Mexico.

## General News Items.

It is reported that some of the Delaware and Hudson Company's mines are on fire.

The Merchants' Exchange Bank of this city has concluded to liquidate and retire from business.

E. K. Smith, Surveyor-General of Montana, has been suspended. The charges preferred are misdemeanors in office.

McDANIEL, one of the New Jersey Central railroad strikers, has been sentenced to pay a fine of \$50, and to remain in the Warren county jail until further orders from the Court.

CAPTAIN Eads, Engineer of the Mississippi jetty scheme, has prepared plans for bridging the Bosphorus, thus connecting Pera with the Asiatic shore. The bridge to be 6,000 feet long, entirely of iron, on granite piers, with a roadway 120 feet above the water.

THE El Dorado deep gravel mining company has withdrawn its proposition from the Water Commissioners to complete a system of water works for this city, on the ground that if iron pipes should be increased a cent a pound in value, the variation would entail an expense of over \$1,000,000.

The *Journal's* Washington special says: The Secretary of War says the President has not said anything about revoking the proclamation for an extra session of Congress, and that the necessity for the meeting of Congress in October is greater than ever. The army appropriation ought to be available by November 1st.

SIDNEY DILLON, President of the Union Pacific railroad, confirms the story that the principal sheps of the company are to be transferred from Omaha to some point towards the western end of the road. No place is specifically indicated, but it is suspected that the new site will be convenient to the company's coal fields.

THE American Anthropological Association, which was organized at the Centennial, and has members from Maine to California, holds its first annual meeting at Cincinnati September 5th, the object being to investigate the pre-historic races of America. Professor C. C. Jones, of Augusta, Georgia, is President, and S. F. Baird, Vice-President.

THE LEHIGH COAL REGION.—A dispatch from Hazleton, Penn., dated the 27th, says: Lindermann, Skeer & Co.'s three collieries at Stockton will resume work, to-morrow, on terms which provide for the restoration of the 12 1/2 per cent. reduction the 1st of September. C. F. Schooner & Co.'s mines, at Beaver meadows, resumed work to day, the 12 1/2 per cent. having been restored, with the understanding that after the 1st of September wages shall be controlled by the price of coal. These arrangements virtually end the strike in the Lehigh region.

## The Department of Agriculture.

There are signs of activity in the Department of Agriculture at Washington, and we hope the Commissioner may accomplish some valuable work. We have heard, by conversation with a friend lately from Washington, that several things which promise well have been undertaken. We are promised fresher work in all the departments. It has been a cause of much regret to us that, in the departments of science related to agriculture, as, for instance, entomology, microscopic botany, and agricultural chemistry, there is seldom any progressive work in these lines credited to the Washington Department, which should be at the head of such inquiries. We trust that this may all be changed, and progressive men or measures, whichever may be needed, may be secured.

We notice that Commissioner Le Duc is doing what he can to learn the needs of the country, and we trust he may be successful. He has addressed a letter to a member of Congress, as follows: "Desiring to further extend the operations and benefits of the Department of Agriculture throughout the Union, it is deemed of great moment to invite the active co-operation of Senators and Representatives from the various States, and through them effect the assistance and sympathy of leading and thinking agriculturalists of their respective sections. I have the honor, therefore, to respectfully request that you will, at your earliest convenience, furnish the Department such information as may be in your power as to the character and diversity of the crops in your section of the State, and possibilities of the soil and climate, and any data of interest on the subject."

## The Locust Plague.

We receive a copy of "The Locust Plague in the United States, being more particularly a treatise on the Rocky mountain locust, or so-called grasshopper, as it occurs east of the Rocky mountains, with practical recommendations for its destruction, by Charles V. Riley, M. A. Ph. D." This monograph by Prof. Riley is a very timely and valuable publication. It is a complete treatise, so far as present knowledge goes, on a subject of great importance in several States, and it makes available to all, facts and beliefs which have been unattainable. The book treats of the characters of the species of locusts, their chronological history, their native home and the regions likely to be visited by them, their habits and power of injuring, their natural enemies and practical considerations, which include the best known way of fighting the pest. Each of these divisions of the subject is treated exhaustively

and with the aid of accurate engravings, and the book will give its reader full possession of "grasshopper science." It is prepared in Prof. Riley's characteristic accuracy and vigor. The printers are Rand, McNally & Co., of Chicago, and from them, we presume, the book could be obtained, if it is not at the book stores. The price, we presume, will not exceed \$1.

The receipt of the present offshoot from Prof. Riley's valuable work makes a remark timely concerning the prospect of his being engaged by Commissioner Le Duc to take charge of the entomological branch of the Department of Agriculture at Washington. We have heard a rumor to that effect, and we desire most sincerely that it may be true. Work like that Prof. Riley has done and can do belongs to the agriculture of the whole country. We want to have him in the service of the whole country, so that we may feel at liberty to call upon him to describe and prescribe for the hosts of insects which are preying upon our crops and destroying our orchards and vineyards. We hope Gen. Le Duc may succeed in winning the service of Prof. Riley.

## Meetings and Elections.

STAR M. CO.—August 23. Trustees—John D. Coughlan (President), George D. Roberts, E. R. Hurko, C. W. Keeney (Superintendent), and L. M. Foulke. William Stuart is Secretary. The Company's property is Cherry Creek, Nevada. Extensive furnaces and hoisting works are being erected for the extracting and working of the ores.

MARTIN WHITE M. CO.—August 25. President, Annis Merrill; Treasurer, Geo. C. Hickox; Superintendent, John Hooper; Secretary, J. J. Scoville.

MELROSE VALLEY M. CO.—August 24. Directors—W. H. Taylor, John P. Kelly, E. V. Jole, Alpheus Bull and Richard Wegener. Officers: T. W. Colburn, Secretary; J. R. Duff, Superintendent; R. Wegener, President, and Alpheus Bull, Vice-President.

STREPTON CON. M. CO.—August 25. Directors—George H. Laws, Leander Sawyer, S. N. Putnam, J. D. Wheeler and Robert Briggs.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large scale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

SALINAS CITY, CAL., Jan. 23d, 1877.  
MESSRS. DEWEY & CO.—Gentlemen: I received to-day my patent papers for my improved feed-boxes, which you have so kindly worked through for me, and I wish to add my testimony to that of your many other patrons as to your promptness and fair dealing in every respect. Thanking you for prompt attention to business in my case, I heartily recommend you to those in need of a patent solicitor. In preference to the many Eastern firms who flood the market with their circulars and representations of cheap fees, etc. Again thanking you, I remain, respect fully yours,  
J. O. JOHNSON.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

## California Fruit Growing Association.—

Location of principal place of business, San Francisco, Cal. Location of property, El Dorado Co. Notice is hereby given, that at a meeting of the Board of Directors, held on the fourteenth day of August, 1877, an assessment (No. 6) of \$3 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 331 Sansome Street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourteenth day of September, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the first day of October, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors,  
HORACE JONES, Sec'y.  
Office, 331 Sansome St., San Francisco, Cal.

POSTPONEMENT.—The day for deciming the stock delinquent on the above assessment is hereby postponed until Saturday, September twenty-second, 1877, and the sale thereof until Monday, October eighth, 1877. By order of the Board of Trustees.  
HORACE JONES, Sec'y.

## Cherokee Flat Blue Gravel Company.—

Location of principal place of business, San Francisco, Cal. Location of works, Cherokee Flat, Butte county, Cal. NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 38) levied on the nineteenth day of July, 1877, the several amounts set opposite the names of the respective shareholders, as follows:  
Names. No. Certificate. No. Shares. Amount.  
Conway, E., Balance of certificate No. 39, 45 shares sold for assessment No. 37..... 03 29 \$1 45  
Randall, A. S., Balance of certificate No. 41, 102 shares sold for assessment No. 37..... 95 187 8 35  
And in accordance with an order of the Board of Directors, made on the nineteenth day of July, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Room 1, No. 402 Montgomery Street, San Francisco, California, on Monday, the seventeenth day of September, 1877, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors,  
O. H. BOGART, Sec'y.  
Office, Room 1, No. 402 Montgomery Street, San Francisco, Cal.

## Dolores Consolidated Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Wilson Mining District, Esmeralda County, Nevada. NOTICE is hereby given, that at a meeting of the Board of Directors, held on the seventh (7th) day of August, A. D., 1877, an assessment (No. 2) of twelve and one-half (12 1/2) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the seventeenth (17th) day of September, A. D., 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the ninth (9th) day of October, A. D., 1877, at the office of said company, at the hour of 2 P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors,  
J. W. CLARK, Sec'y.  
Office, Room 2, No. 418 California St., San Francisco, Cal.

## Nevada Land and Mining Company.—Lo-

Location of principal place of business, San Francisco, California. Location of works, Spruce Mountain Mining District, Elko County, Nevada. NOTICE is hereby given, that at a meeting of the Board of Directors, held on the sixteenth day of July, 1877, an assessment (No. 18) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, rooms 5 and 6, No. 302 Montgomery street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on Monday, the 20th day of August, 1877, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the eleventh day of September, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors,  
WM. H. WATSON, Secretary.  
Office—Rooms 5 and 6, No. 302 Montgomery St., S. F., Cal.

## Washington Blue Gravel Co.—Location

of place of business, San Francisco, Cal. Location of works, Mt. Pleasant Mining District, Sierra Co., Cal. NOTICE.—There is delinquent upon the following described stock, on account of assessment No. 2, levied on the second day of July, 1877, the several amounts set opposite the names of the respective share-holders, as follows:  
Names. No. Certificate. No. Shares. Amount.  
Henry Wichser..... 14 2 \$80 00  
Matty Götter..... 17 1 20 00  
F. P. Muller..... 24 1 20 00  
Nicholas Luchinger..... 27 1 20 00  
And in accordance with law, and an order of the Board of Directors, made on the thirteenth day of August, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, southwest corner of Commercial and Leidesdorf Sts., (Britton & Rey's Lithography), San Francisco, on Monday, September third, 1877, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
HENRY STEINEGGER, Secy.

LEWIS R. MEAD.....Secretary

## SHEET IRON PIPE.

## Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

## PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

## SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

## HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Grinders, Bridges  
and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the  
lowest possible terms.

## California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

## BIRCH, ARGALL & CO.,

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,  
And General Machinists.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.  
Manufacturers of

IMPROVED PORTABLE

## Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,  
RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every De-  
scription Manufactured.

Sole Proprietors and Manufacturers of

Lynch's Ventilating and Illuminating Tile,  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

## CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cocks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Coup-  
plings and Connections of all sizes and patterns, furnished  
with dispatch.  
J. H. WEEO. V. KINGWELL.

## GOLDEN STATE & MINERS' IRON WORKS.

Manufacture Iron Castings and Machinery  
of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

## STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

## McAFEE, SPIERS & CO.,

BOILER MAKERS AND

GENERAL MACHINISTS,

Howard between Fremont and Beale Sts., San Francisco.

## Machinery.

THE

## LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

BRUCKNER'S PATENT

## REVOLVING FURNACE,

For Chloridizing, Desulphurizing and  
Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEAR-  
ING AND MINING MACHINERY.

Send for our Illustrated catalogue.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER

J. C. Sanderling, Sole Ag't Pacific Coast  
51 Fremont Street, S. F.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

## TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,  
320 Sansome Street,

(Room 10.)

## The Gardner Automatic Governor.

USE  
MORE THAN TEN THOUSAND NOW IN  
EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND  
PRICE LIST.

When all others fail, buy a "Gardner." We have  
all sizes of these celebrated Steam Governors on hand  
at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

## THE O'HARRA

## CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—2 1/2 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2 1/2 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61 1/4  
In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

D. J. O'HARRA,  
Reno, Nevada.

Dewey & Co. { 202 } Patent Ag'ts.  
Sansome St.

## Metallurgy and Ores.

## JOHN TAYLOR & CO.,

Importers of and Dealers in

## ASSAYERS' MATERIALS,

CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
etc., manufactured by the Patent Plumbago Crucible  
Co., of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.  
Also, to our large and well adapted stock of

## Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.  
Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

JOHN TAYLOR & CO.

## THOS. PRICE'S

## Assay Office and Chemical

## Laboratory,

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and re-  
turns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of  
the interior by Express, and returns made in the same  
manner.

Careful Analysis made of Ores, Metals, Soils, Waters,  
Industrial Products, Etc. Mines examined and reported  
upon. Consultations on Chemical and Metallurgical  
questions.

## Nevada Metallurgical Works,

No. 23 STEVENSON STREET,

Between First and Second, one-half Block off Market.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process  
for working Ores.

Special attention paid to Examinations of  
Mines; plans and reports furnished.

Used in Connection With PURVINE

## Wooden Amalgamating Pans and Settler.

This is a complete, perfect and economical adaptation  
of the humid method to the treatment of Gold or Silver  
ores, associated with

## COPPER

And other base metals, or to ores free from base metals.  
It can be adapted to any first-class Gold or Silver mill, at  
a reasonable additional expense.

For further information, address

J. O. STEWART,  
Georgetown, Colorado.

## To Ship and Engine Builders, Steam- ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.

Address and references can be obtained at office of Sci-  
entific Press.

# \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

## Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the NEW YORK WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

433 Montgomery St., S. F.

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

HENRY C. PERKINS,

North Bloomfield Nevada County, Cal.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOTT CUT and SLAT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco

## LEVI STRAUSS & CO.,

Patent Riveted

Clothing.

14 & 16 Battery St.,  
San Francisco.

These goods are specially adapted for the use of FARMERS, MECHANICS, MINERS, and WORKING MEN in general. They are manufactured of the Best Material, and in a Superior Manner. A trial will convince everybody of this fact.

Patented May 12, 1873.  
USE NO OTHER, AND INQUIRE FOR THESE GOODS ONLY.

## BLACK DIAMOND FILE WORKS.

G. & H. BARNETT,

Manufacturers of Files of every Description,

Nos 39, 41 and 43 Richmond street,

PHILADELPHIA, PA.

Sold by all the principal hardware stores on the Pacific Coast. LINFORTH, KELLOGG & CO., General Agents for the Pacific Coast.

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

## San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

## A VALUABLE MINING BOOK

BY J. S. PHILLIPS.

The Explorers', Miners and Metallurgists' Companion 682 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal*.

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco*.

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era*.

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Oregonian Monthly*.

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald*.

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta*.

In the several sections the work is eminently practical. It is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner*.

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter*. It is the best single English treatise we know of the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price \$10.50.

Thanks for Prompt Attention.

STOCKTON, June 26th, 1875.

Messrs Dewey & Co., S. F.—I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11th, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,  
GEO. G. BUCKLAND

SAMPLE COPIES.—Occasionally we send extra copies of this paper to those we believe would be benefited by subscribing for it themselves, or who are willing to hand the paper and speak of its merits to others. We call the attention of such to our prospectus and terms of subscription.

## MINING MACHINERY DEPOT.

Rock Drills, Air Compressors—Burleigh's.

Machinists' Tools—Putnam's. Compound Steam Pumps—Walker's. Plunger Pumps—Cope & Maxwell. Bucket Plunge Pumps—Valley Machine Co. Centrifugal Pumps—Heald & Cisco's. Vertical Steam Engines, Hoisting Engines—Haskin's. Chemical Engines, Hook and Ladder Trucks, Fire Extinguishers—Babcock & Champion. Farmer's Electro Battery. Hill's Exploders. Stow's Flexible Shaft.

ONLINE COMPOUND FOR LUBRICATING MACHINERY. FLOWER'S STOP-VALVES FOR STEAM, WATER OR GAS. PLANING, TONGUING, GROOVING AND DOUBLE SURFACING MACHINERY—PUTNAM'S. MOORSE'S TWIST DRILLS. PATENT TWIST DRILL GRINDING MACHINE—VAN HAGEN'S. EMERY WHEELS AND STANDS. SAW GUMMERS—WOOD'S. STEAM INJECTORS.

Rubber Hose, Packing & Belting, Wired Suction Hose, Carbolized Hose, Steam Hose.

Send for Circular.

PARKE & LACY, 417 Market Street, San Francisco.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post 10 cents.

DEWEY & CO., Publishers, S. F.

## PACIFIC LAMP & REFLECTOR FACTORY

EMILE BOESCH,

## Another Industrial Enterprise.

In the face of the many large carriage dealing and manufacturing establishments on this coast, the starting of another in that line any time within the last four years required a great deal of nerve and business energy, and to be successful also called for capital. The California Carriage Manufacturing Company, seeing yet many idle mechanics, and seeing, as they believed, an opening for first-class vehicles, conceived this idea of starting their present business in 1875, and thereupon formed their company, consisting of Messrs. W. L. Pritchard, Georgs Cowles and C. Zimmerman, and selected Sacramento as a favorable place for their operations. The selection of the place was ruled by climatic considerations. It is a well known fact that wagons put up in the damp climate of the coast, when taken to the hot interior valleys, soon shrink so that the iron gets loose upon them, and the joints of wood do not fill, thereby weakening the whole immeasurably. The Sacramento climate being essentially identical with that of the whole interior of the State, it followed as a natural and logical conclusion that what was put up dry and tight there would remain tight, solid and unaffected by the heat of other sections. Sprinkling of felloes, loosening of spokes, dropping of hubs, bands, etc., is what they wished to avoid, and they have done so.

Having selected their site, the building was put up with a special view to accommodate an extensive business, and with the least expenditure of labor during the manufacturing period. In fact the whole building was built for the business, not the business for the building. Everything is convenient and economical; no power or time is wasted on material from the time it goes into the building as plank, wood and leather, until it comes out the finished vehicle. The building has a frontage of eighty-eight feet on K street, and one hundred and sixty feet on Eighth street, with plenty of yard room outside on the lot, which is much larger. On the first floor we find the motive power of this machinery of the whole establishment, consisting of a steam boiler and engine of forty-horse power, which runs the elevator, steam forging hammer, hand-saws, lathe, planer, etc., all of which are used to supplement the usual bandwork. Here the forging, tempering and shaping of the celebrated Doland & Scherb C spring is done, which is a specialty with this company.

Stepping on the 18 x 14 foot elevator platform, up we go to the second floor. On this floor, at the corner of K and Eighth streets, is the business office, and a large and commodious show window, in which are exhibited light buggies, skeleton trotting wagons and sulkeys, sets of harness, robes, whips, etc. The main room of this floor is used for getting out the wood and running gear of carriages, and setting them up. Here we find a smaller band saw, capable of cutting the most beautiful scroll work, or sawing wood into the most intricate shapes and patterns, to be used in the manufacture of vehicles, or for any other desired purpose. Here also are two circular or splitting saws; a hand planer; boring and mortising machine; turning lathe; moulding machine, and every appliance and tool for the artistic working of woods.

Ascending again, we reach the third floor, where are to be found the various shapes, patterns and sizes of vehicles they manufacture, ready to run when the proper horse is hitched to them. Using the finest taste in selection of style, yet they are ready to defer to the judgment of any customer, and give him what he wants. They usually keep in stock \$50,000 worth of vehicles from which to select.

Again having recourse to the elevator, we ascend to the fourth floor, where the painting, varnishing, upholstering and general finishing touches are given to their carriages and buggies. Employing none but the best high priced workmen, the best selected material in the United States, the most talented and finished workmen in the upholstering and painting departments, and applying all the known aids to mathematical certainty and expedition that invention affords, it would certainly be a miracle if a poor

wagon or buggy got out of their shop. That such a miracle is unheard of after two years' search, is the best of evidence that miracles have ceased to occur.

The "California Carriage Manufacturing Company" is prepared to manufacture anything that runs on wheels, from a baby-wagon to a street car. They are now turning out thirteen cars for the new California street railroad of this city, and others for Sacramento. They are also turning out a splendid omnibus for one of the city hotels. They are prepared, and have facilities for manufacturing, any kind of agricultural implements. Their farm wagons are unsurpassed, and from a wheelbarrow to a sixteen mule wagon, they are ready to supply orders, which, for durability and finish, cannot be surpassed by any institution anywhere. The interior of the State is being dotted with their highly finished family carriages, buggies, etc. Nevada and Oregon are sending their orders, and not to have one of these carriages, with their patent "Doland & Scherb" steel springs, is to agree that you do not know what comfort and pleasure there is in riding in one of these in

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

At the De Fres mine, this week, they will commence sinking main shaft. After the station shall have been timbered, sinking and driving on 210-foot level will be carried forward at the same time. The company's mill is nearing completion. Everything in and about the mine is going well.

No improvement is reported from the Empire (G. V.) mine. The ground is hard and the ledge small.

The 1150-foot level station of the Utah is being enlarged.

Work has been commenced on the new mill for the Navajo mine.

The main shaft of the Grand Prize has cut into the ledge, about three feet in width; flow of water strong.

KUSTEL & HOFFMAN'S IMPROVED AMALGAMATOR.

preference to the other back-breaking institutions which have been in use, but are fast being numbered among the things that were. We tried one of these last week around Oakland and out to Piedmont springs, where the road was full of holes and chucks, and must say that they are the easiest riding buggies we ever saw. A succession of cradle holes just gives them a gentle swinging motion—no bouncing and teeth chattering, like the elliptic springs.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Northern Belle, August 28th, \$6,216; California, 31st, \$141,905.93—total to date, \$1,067,820; Con. Virginia, Sept. 1st, \$152,387.19—total to date, \$1,007,061; Empire (G. V.), Sept. 1, \$11,000; Tybo Con., Aug. 25th, \$4,305.48; Leopard, Sept. 3d, \$9,000; Grand Prize, 3d, \$21,500; Minnetta Belle, 22d, \$6,500—total for August, \$29,500; Endowment, 5th, \$2,948; Tybo Con., Aug. 30th, \$8,407; Sept. 1st, \$3,985—total for August, \$54,165.

**NEW IDRIA.**—Attorney General Devens has given an adverse opinion to the New Idria mining company's request that the question of title to the quicksilver mines be reopened before the Interior Department. This will leave this celebrated case to be settled by this courts and Congress.

## Kustel & Hoffman's Amalgamator.

The accompanying engraving represents an amalgamator of a new and very simple construction, at present in daily operation at the Mechanics' fair. It is an improvement devised by Mr. G. Kustel and O. Hoffman, to overcome the difficulties in the amalgamators at present in use.

The amalgamator forms a ring with an amalgamating surface and copper plates. This ring is divided by a cross partition, on one side of which are rifles filled with quicksilver. The balance of this arch is laid out with horizontal amalgamated copper plates, *b*. These plates form several steps, as seen in the cut. On the other side of the partition, at the end of the copper plates, is the outlet for the tailings, at *d*. The pan or amalgamator receives an oscillating motion of about 240 revolutions per minute.

The iron vessel, *c*, is not necessarily connected with the amalgamator. It contains sodium amalgam; and the mechanism is so arranged as to discharge, every minute, a few drops of sodium amalgam into the rifles, keeping the quicksilver always active. This apparatus is used where the gold is coated with a brown or reddish color and very difficult to amalgamate.

The quartz, in case of wet crushing, is conveyed directly from the battery on to the quicksilver in the rifles. This quicksilver is kept in lively action by the oscillating motion of the pan, so that the pulp is kept constantly in contact with a perfectly clean surface, causing a very effective amalgamation, even of "float gold," which cannot escape frequent contact with this mercury. Although the motion is very brisk, no "flouring" whatever occurs to the quicksilver.

Passing over the rifles the ore comes, very evenly spread, over the copper plates, and moves with considerable friction on the horizontal surfaces, the sand being perfectly loose, so that all heavier particles reach the plate from the start. Particles of gold that might have escaped the rifles and the plates will find another favorable amalgamating place at each step, owing to a slight concussion when dropping from one step to another.

The application of coppered and amalgamated canvas, now experimentally substituted for copper plates in the pan, is quite new, and its practicability must be proven by more continued use; but as to saving gold, it seems to be much superior to ordinary copper plates. The roughened surface catches the amalgam and quicksilver better than smooth copper. Mr. Kustel proposes to make future machines a little larger than the one exhibited at the fair.

This amalgamator can be used to great advantage in saving quicksilver and amalgam in silver mills, if attached to the settlers. All quicksilver and amalgam that might escape the settler will be saved, and, considering the loss of many thousands of pounds of mercury daily, in treating silver ores, this amalgamator deserves special attention and consideration of those interested in silver mills. For the separation of gold from concentrated or unconcentrated black sand, there seems to be no amalgamator that could answer the purpose better, as it retains the gold entirely free of black sand. The capacity of a pan six feet in diameter, offering 184 square feet of amalgamating surface, is from six to eight tons in 24 hours, according to the density of the stuff. The device for feeding the pan, in use at this fair, is very efficient, as both water and pulp can be gauged accurately. The machine works very nicely and our mining friends will do well to examine it. Those desiring further information may call on, or address, Messrs. Kustel & Hoffman, at 210 Front street, in this city.

THERE were a number of mining accidents on the Comstock, last month. In all, 15 men were injured, six of them receiving their death wounds.

CAPTAIN RAPHAEL SEMMES, who commanded the privateer *Alabama* during the civil war, is dead.

**SUTRO TUNNEL.**—We have received a very unique profile map of the Sutro tunnel, compiled from official sources, and drawn by Kerchoff & Specht, 1053 Harrison street (P. O. box 1220), in this city. Outside of its value for reference, it is a good specimen of sunlight printing. On the profile are tabular statements giving all the details for each month in which the work has progressed, which seem to be carefully compiled, and are of great interest. In our next issue we shall speak of this subject further.

A FIRE at Auhorn, Placer Co., this week caused a loss of \$75,000; insurance, \$25,000.

### A Reception to Distinguished Scientists

On Thursday evening, of last week, a special meeting of the California Academy of Sciences was held for the purpose of extending a welcome to California to Sir Joseph D. Hooker, C. B., President of the Royal Society, England; Dr. Asa Gray, Professor of Botany, Cambridge University, and Prof. F. V. Hayden, U. S. Geologist. Prof. George Davidson, as President, had Sir Joseph Hooker seated on his right, and on his left Dr. Gray and Prof. Hayden. Mr. Henry Edwards, Vice-President of the Academy, and several other officers, completed the platform group. Since the memorable reception of Agassiz, no event of a like character so notable has occurred in the history of the Academy.

Prof. Davidson called the meeting to order, and addressed the guests as follows:

This special meeting of the California Academy of Sciences has been called to welcome to our coast the distinguished scientific gentlemen who are present with us this evening.

It has been our privilege and our pleasure, upon former occasions, to extend kindly greetings to others who have established their reputations for good work, and honest work, and hard work; yet, among the best, none stand higher than our guests of to-night.

Sir Joseph Hooker's name is well known to you all, "but is familiar as a household word" to those who have devoted their special study to botany. For half a century he has given his life-labor to that branch of science, which his father so ably advanced; not only the labor of the closet and the conservatory, but the work of the field, where broad views of nature expand the active thought, and give it marvelous breadth of grasp and wonderful capacity for logical deduction.

The search for truth for truth's sake is the irresistible impulse and spur of every scientific inquirer; but human nature is universal, and it is a peculiar satisfaction to us to know that men and women who are working and thinking in other and varied lines of business are willing and ready to appreciate earnest and honest scientific thought, and the full credit which is accorded to Sir Joseph in all the countries and nationalities of the world must be accepted as some small measure of recognition of his eminent ability and extended labors, whilst the honors which have been accorded to him at home militate against the antiquated idea that a prophet hath no honor in his own country.

This is the second time that Dr. Asa Gray has visited this coast, and we feel like entering a special protest against his short and hurried stay, and particularly at his coming during so unfavorable a season for botany.

In the future we shall endeavor to keep him thoroughly "posted" in the predictions of the weather-wise, in order that he may reap the full fruition of his searches.

We greet him with kindly feeling, and with a flush of pride, as representing the highest level of botanical knowledge in America; and as fully perceiving and elaborating the inevitable law of evolution in the flora of the earth.

You have so often heard the trite remark that science knows no nationality, that sometimes just the shadow of a doubt must arise of its truthfulness by its continued iteration; but had you witnessed, as I did the other day in the country, the juvenescent hilarity, and enthusiasm, and fraternity of our two friends over every rare flower, grass or plant; over your laurels and your oaks; your redwoods and your cypresses; you would have been thoroughly satisfied that the millennium of science was not so mythical as imagined.

I do not dare to betray all the joys and pleasures of that day. It is marked by a great red mark in my labors. I forgot all about Mars and Venus, irrigation, breakwaters and reclamation, triangulation, topography and hydrography, until our last, but not least-respected guest, Prof. Haden, waked me from my big holiday by demanding to know some of the details of the geology of that part of San Francisco peninsula along which we were being so handsomely driven by one of our life members. Fortunately for me, we were too far away from the rocks to misver my statements. But I was astonished that one of the *finest* geologists, and one of my best friends, should try to entangle me just where I was weakest!

Prof. Hayden: I greet you as a man who is doing some of the most valuable geographical and geological work upon this continent, and doing it with an energy, and a vim, and a perception that must lead to the broadest results. Three years since I spent a day examining your work, then being reduced to paper, and was more than gratified to see that you had the faculty, not only of execution, but of administration, by surrounding yourself with men efficient in their specialties. The publication of your results will furnish proof positive of the character of your work, and will bear testimony, at home and abroad, of the deep interest this country takes in the development of its great physical features and resources.

All the sciences form but a chain, and our botanical friends will be able to study with advantage your extended maps, in order that the peculiarities of the flora of Colorado, of the regions of the Yellowstone, may be properly appreciated and fully comprehended.

It was my pleasure to first bring, for the inspection of the Academy, advance copies of the photographs you obtained of the wonderful and then unknown region of the Yellowstone; since then, your published works are familiar to us all.

Gentlemen, I wish I had that rare gift to express, as fully as I could wish, all that I feel in kindness toward you, and in admiration of your abilities. I beg of you to take the assurance for the expression thereof.

#### Henry Edwards's Address.

Mr. Henry Edwards, the eminent entomologist, Vice-President of the Academy, was called upon, and spoke as follows:

"I can add but little to the generous welcome offered to-night by our worthy President to the distinguished men who have honored us by their presence this evening. But, as an humble student of the science which two of them have made illustrious, I may perhaps be permitted to add a small leaf to the many garlands with which they are already crowned.

Wherever the name of botany is known, and the love of the gentle pastime of cultivating flowers is cherished, the names of Hooker and Gray are alike appreciated and loved. It is to such men as these that we owe our knowledge of what beauty lies in the plants which adorn our landscape and give a charm to the surroundings of our homes. They deck the familiar walk with a novel beauty, and adorn the untrodden path with a new and undreamt of grandeur. Over the dense and impenetrable forests, which here and there mark the surface of the world, they cast a halo of the poetry which is essentially their own—the poetry which clings to science as its sister—and which forwards its progress as the dewdrop helps onward the growth of the tree.

With the true brotherhood which exists among men of science over the world, these two have joined hands together and worked for the accomplishment of a purpose, nobler than is usually believed. The interests of science are the strongest bands which can bind nations together, and should the amicable relations now existing between the United States and England be ever broken (which God, in His mercy, prevent) the inherent love of the people for each other would be held together by the tender chains which science weaves, and the union of such men as Hooker and Gray would cement them beyond the power of national quarrels to separate.

What are Canadian fisheries and Alabama claims to them? The grand old pines of the forest wave their branches and sing their eternal song, and the dainty flowers, springing forever from the grass, still offer their petals to him who seeks to learn their hidden wonders.

Fortunate, as we are to-night, to have the honor of greeting our illustrious guests, still more fortunate will those be who come behind us in the after years, who will reap the benefit of their precious labor, and drink to its fullest depth of the fountain which they have laid open to our gaze. Foremost are such men among the benefactors of the race, and it will be a happy memory in the hereafter of San Francisco that she has been allowed the privilege of tendering her respect to such instructors, such noble specimens of humanity, as the men whom we greet to-night as our fellow-laborers and as our friends.

Mr. R. E. C. Stearns, Secretary of the Board of Regents of the University, spoke in a humorous vein of what the representatives of science might explore here in addition to the botany of the coast.

#### Sir Joseph Hooker

Returned thanks for his welcome. He came here to learn, and not to teach, and his visit was immediately due to the experience of his old friend, Prof. Gray—a friend of 40 years' standing—and to the invitation of his old correspondent, Prof. Hayden, whose guests they had been during the time they spent in Colorado and Utah. His acquaintance with the vegetation of America had heretofore been an extremely slight one. In association with his father's pursuits, who was for many years occupied in publishing investigations of the plants of the British possessions of North America, he was led to the investigation of the Arctic flora. In the investigation he was struck with the uniformity of vegetation on going round the whole globe in the North. There was very little difference between the vegetation of America and the Old World within the Arctic circle; but upon close examination he found that even the American flora was divisible into two sections by very slight but still definite characters; that in crossing over from Greenland to the American islands, so-called, there was a distinct change in the vegetation, though very slight.

The opportunity he had now had of crossing the continent of North America from east to west, had shown him that that distinction is carried out to a very much greater extent than he had any notion of. The publications of Gray and others had made him aware that there is a broad line of distinction between the vegetation east of the Mississippi and west of it; but he did not expect to find the variety so great as it is, and he was strongly inclined to say, though he said it under correction, that there is probably a greater difference between the east and west coast of the American continent than there is between any two similarly related regions in any part of the globe; that you may travel from England to Spain, from Siam to China, without finding so diverse vegetations as by crossing the Mississippi and comparing the banks 100 miles east on one side with 100 miles west on the other. As far as the country east of the Mississippi is concerned, he was, by practical observation, almost entirely ignorant. He knew nothing of it except from the copious notes of Prof. Gray conned while traveling. Since then he had the opportunity of spending some

weeks in the Rocky mountains and then of coming here, and he found a more curious difference than he had anticipated in the vegetation between the Rocky mountains and the Sierra Nevada. He had every reason to suppose that this great difference of vegetation exists south of the parallel along which he had traveled. Time had not allowed them to digest the notes collected on the way, and more than he had announced he was not prepared to say. The President had asked to say a few words with respect to the Academy. In England they knew well enough what it is to wait for results; but he might be believed when he said that the destinies of science on this coast are great, and a time will come that will show great results, and that will come with immense force, and for these two reasons: There is here a most intelligent and a most active and progressive population, and, in the second place, there is here one of the most remarkable assemblages of natural objects and physical phenomena that any part of the world possesses. In speaking thus, he included the whole coast, north and south, of California. There is no section of the earth in which so many singular phenomena can be observed as in this. Without seeking to give advice, he might point out what has been the element of success in the greatest academy of England, the Royal Society. It began with very few men, and, for the best part of two centuries, it was supported by what he might, without disrespect to his ancestors in science, call elderly people. It was by the elderly men who loved science, holding together congenially year after year, and almost century after century, that the young men of the society were drawn to it, and it is but lately that young men in any numbers have come into the society. For success there are three principal elements—the holding together of the elderly members, of those who have had experience of this life in other matters than science, and who bring that experience together, with methodized common sense, of which science consists, to bear upon the objects of the society itself. In the second place, there is the important work of the Secretary, together with that of the Publication Committee, which should carefully pass judgment upon the communications to be given to the world. The supervision of the papers of a society by several members is perhaps the most important scientific work that any society can perform. Thirdly, there is the necessity of looking well after the funds, and managing them with economy and prudence.

Prof. Davidson thanked Sir Joseph for his advice, and said the Academy is aching now for the young men of the country to come in and take the place of the elderly members.

#### Dr. Gray,

In acknowledging the kindness of the reception, said it is almost 40 years since Sir Joseph and himself spent some few hours together in the neighborhood of London, at the table of the then very venerable man, long since gone to his rest, Archibald Menzies, who was surgeon and naturalist of Vancouver's voyage. The interest in the venerable gentleman arose from the fact that he had been round the globe, and particularly had visited this part of it, and he was the first English naturalist, and almost the first naturalist, who set foot on this part of the continent. Partly through Prof. Davidson's investigations he had been enabled to trace the footsteps of Menzies, whose name is merged in many of our plants, the madroña for instance. He had found that he was in San Francisco, at the Presidio, and that he found his way as far as Santa Clara or San Jose, and it is very well known that he visited the point which was then the oldest settlement; that he landed and botanized at Monterey. It was with peculiar pleasure that they had followed in his footsteps at Monterey, and had been able to gather some plants and to see the withered remains of others that he first made known to the civilized world. Monterey is also the spot that some earlier naturalists visited, where the Spanish naturalists, Mocino and Lesse, collected plants, and also the Russian naturalists, Chamisso and Eschscholtz, whose names are familiar to all our gardens—household names in plants. The season of their visit to the coast had proved unpropitious on account of the great drought, and what is still worse, the ravages of the great flocks of sheep, which have devastated the herbage vegetation of the Sierras. Fortunately the forests remain, the most important vegetation in respect of climate, geographical distribution and utility. They had been very busy, and their work had not been in vain. They would be enabled to make some interesting comparisons, after visiting the Rocky Mountain region, and to settle, from observation in the field, some of the questions they had sought to settle in the laboratory and the conservatory. Dr. Gray, in conclusion, referred to his visit five years ago, and the great pleasure it had given him to have as companion his old friend Joseph Hooker.

#### Professor Hayden

Indicated the features of the geological survey in progress under his direction, and said he has long desired to make some comparison between the Sierra Nevada mountains and the Rocky mountains. It had always been his belief, although the belief has been corrected by his studies of the Eastern slope, that there is a general geographical as well as geological unity in all the different ranges of mountains that compose our country. Other geologists have endeavored to give to the Sierra the name of the Cordilleras, as a generic term, extending it to the Andes and to the Eastern range, the Rocky mountains. Other geologists have sought to

make the Rocky mountains the generic name, including in that range all the rest, and making the Sierra Nevada a branch. He was now inclined to think there is difference enough in the two ranges to regard them as separate, and perhaps almost independent ranges. One object of his visit was to examine the Yosemite valley and study the phenomena of its formation, and this he had been enabled to do. At some time he hoped to be in a position to study the geology of the coast generally.

Prof. Davidson then made some practical remarks on the subject of the ocean currents on the coast, with reference to their influences on climatology, and the distribution of species. His experience in prosecuting the work of the coast survey has given him special advantages for observation in this direction, and his remarks were listened to, with interest by the audience.

### Mining in Butte County.

Butte county has yielded millions of dollars in mineral wealth, and still her area has not begun to be developed. At the present time there is an increased activity in mining operations, and we hear of numerous mines that are being worked with profit to their owners. Moneyed men are just beginning to see that mining can be made a profitable industry. Capital is being attracted here from outside the county. Men of intelligence find that mining pursued as a legitimate business can be made to pay. Nerve, energy and means are prerequisites for success. We hear of quite a number of instances where private individuals are working their mines with profit. Now the field is large enough for others to enter, and it should be improved. Men of moderate means can combine and work in a small way at first. As soon as they get something ahead they can enlarge their sphere of operations.

We have often thought that the lava beds in this vicinity could be worked as advantageously by white men as by the Chinese. As it is now, the Mongolian monopolizes the ground, and not a few of this servile and despised race acquire wealth from their operations. Thousands of dollars are taken out by them every month, and but few if any, of the white race, seem disposed to work these lava beds in competition with them.

Mining judiciously and economically pursued can be made a profitable industry in this county. There are acres and acres of good mining ground lying idle. There are miles and miles of gravel ridges which have never been prospected. There was never a better investment than a good gravel mine. It is a paying institution. All of our bill diggings are rich in wealth, but the scarcity of water has prevented them from being worked to that extent which we expect to see one of these days, when water will be plentier. There are places in Feather river which would pay well if worked. The river has not been so low for many years, and there was never a better time afforded for ascertaining where the gold is to be found than the present. A few men of capital have already started the ball in motion, and we anticipate good results. Others will follow. With improved mining machinery, such as is now being introduced, the mining outlook in Butte was never more promising. Our business men and laboring classes have certainly good reasons to congratulate themselves. All new mining enterprises should be encouraged, and a helping hand given to those engaged in their prosecution. Every new enterprise is a positive benefit to the community, adding to its prosperity, and relieving the burdens of taxation, which, at the present time, are so hard to bear.—*Oroville Mercury*.

### A New Concentrating Mill.

The Sunshine (Colorado) *Courier* says: On Tuesday we visited the fine new mill property of Everitt, Haberlin & Co., on Four-Mile. This mill has been put up and started to running within the last two months, and as it is now the nearest concentrating works to Sunshine, it is a matter of the first importance to this camp and others near by to know what the mill is doing toward making the low-grade ores a profit to the miner.

The partners in the new mill are W. A. Everitt, F. Adams and Mr. Haberlin, but the latter is not at present in Boulder county. The mill is a neat frame structure, and contains ten stamps and four true belts. Five men are employed to run it, three on the day shift and two at night, and they can concentrate from ten to twenty tons a day, according to the nature of the mineral. As an extra precaution against losing any of the mineral, they use four tanks for catching the float mineral, the refuse water passing from one to the other. The experience of several weeks running has proved that the firm can get all the expenses of concentrating out of \$11 ore, and when the hauling does not cost over \$1.50 per ton, they can treat \$15 ore at a small profit to the miner. Ore that will actually run \$25 they offer to buy, giving the miner a percentage. The run so far has been principally on Melvina ore, and about 16 tons of Grand View low grade. The road from Sunshine to the mill is a steep one, but it all tips the right way, and can be easily passed. The mill is situated about a mile and three-quarters from this camp by the road, and if the low-grade ore at the numerous mines within half a mile of us will run \$25, \$30 or \$40 per ton, as is so frequently stated, this is the opportunity to utilize it.

## MECHANICAL PROGRESS.

## A Screw Ventilator.

Whether old Archimedes thought his screw could be employed to lift bad air out of "public buildings, dwellings and cow-houses," may be a question, but thus it has been applied. We read of an English invention in which a screw, made to revolve within a cylindrical casing, will cause a current upwards or downwards according to the direction given to the thread or blade. In this case the direction is, of course, upwards; and the screw is arranged on a spindle. The spindle is prolonged upwards, and to its top is attached a dished hood provided with vanes, which are acted upon by the wind, thus causing the spindle to revolve. Between the hood and the screw are other perpendicular vanes, arranged round a circumference about equal to the screw casing. These vanes contribute to the motive power; also allow of the escape between them of the vitiated air withdrawn by the screw. They are disposed so as to overlap each other, while at the same time allowing a space between, in such a way as to exclude hail, rain, snow or dust, while they also prevent any down draught. The centers of the spindles are conical and of steel hardened by a secret process, revolving in steps of the same substance; they run in oil cups, the reservoirs of which contain enough oil to last for eight to ten years. Indeed, we are informed that some ventilators on this principle have been run without attention for 14 years. The consequence of the friction being thus reduced to a minimum is that the ventilators will revolve with the least breath of wind, and meteorological records inform us that the wind is never absolutely still; so that, with these appliances, we may rely upon a constant changing of the atmosphere in the room to which they are applied. There is an arrangement for driving the screw by power when very active ventilation is required, especially for expelling accumulations or large quantities of hot air and sulphurous gases; dirt, dust and waste flyings; and injurious effluvia from gasing and other workrooms.

**AUSTRALIA AND AMERICA.**—A correspondent, writing to *The London Times* from Sydney, says: "Our appearance at Philadelphia has drawn the attention of American manufacturers to us in a most marked and unexpected degree. A country that, like New South Wales, is rolling in wealth, must be a country that is able to buy, and a country that is able to buy is exactly the country that American manufacturers have been anxiously looking out for. Our representatives at Philadelphia have come back strongly impressed with the fact that there are many things the Americans can supply us with advantage. Our government has an offer from Messrs. Baldwin & Co. to furnish a locomotive engine for about £1,000 less than the cost of an English engine, and to leave the payment open until the engine has been thoroughly proved and approved. A Pullman's sleeping car and an ordinary passenger car have already been ordered, and American wheels, axles, rails, and brakes are strongly pressed on our acceptance. As our government engineers are all of the English school, American novelties will have a hard battle to fight to win official acceptance, but the demand for economy in railway construction and working is so great that people and Parliament will press on the Minister for Public Works a fair trial for any American novelties that may seem to be suited to our wants. The English manufacturers, therefore, who have hitherto supplied us, must look to their laurels."

**BRONZE FOR VALVES AND COCKS.**—The question of the best alloy for steam-engine valves and cocks has been discussed before the Vienna Association of Mechanical Engineers. The following were submitted as the most durable alloys: I. Copper, 84; tin, 2.9; zinc, 8.3; lead, 4.3; iron, 0.4. II. Copper, 83; tin, 17. III. Copper, 80; tin, 18; zinc, 2. If after casting, and while still red hot, cold water is poured over the bronze, it becomes harder and finer in grain, and tougher, as the tin, instead of separating out, as happens when the bronze cools slowly, remains mixed, and the alloy retains its compactness. The toughness and quality of the bronze are stated to be very considerably increased by this method of treatment, to which the alloy No. II. is more especially susceptible.

**PRIZES FOR ALLOYS.**—The Council of the Prussian Association for the Promotion of Industry announce that they will award the following prizes this year and next: For the best series of alloys of iron and manganese, £100; for a process for separating cyanide and ferrocyanide of potassium from sulpho-cyanide of ammonium by means of potassium compounds, £50; for a process for utilizing anthracite oils in the preparation of aniline and alizarin, £75.

**CLEANING IRON WIRE.**—Betz, of St. Ingbert, has constructed an apparatus for freeing iron wire by mechanical means from forge scale. The process consists in drawing wire over rollers, which remove the scale from it on each of its sides by mere pressure, the last step in the process being to pass it through a box containing sand and calf-hair, whence it is wound on bobbins. The wire is said not to suffer in quality by the manipulation it undergoes.

**ON FILES.**—A writer for the *Polytechnic Review* notes the following points: In using a new file, the pressure employed at first should be comparatively light, until the very sharp edges of the teeth have been removed; after which, stronger pressure and deeper cut may be made without injury to the teeth. But if the teeth have, hard usage put upon them while their edges are keen and penetrating, they are likely to take hold more strongly and become broken off at the root. A few careless strokes may damage a new file as to take away half the "life" of the first cutting. The skins of castings are not only "chilled," and hence harder than the interior, but are often glazed with a vitreous surface, in which, also, gritty particles are imbedded. No new file should be used on such surfaces, nor on welds where borax or vitreous fluxes have been used, nor on oxidized surfaces; but a worn file should be used to attack such work, which will scarcely harm it. For filing steel, grades coarser than second are apt to be too "hoggy;" steel cannot be ripped off like brass or iron, and the same cut of file should not be used on steel and on iron, any more than on brass and iron, or horn and iron. In buying files, see that full weight is given, especially where recutting is to be done. While a light-weight file will hardly stand one recutting, one that is full weight will bear recutting two or three times.

**AMERICAN TOOLS.**—In his review of the late World's Fair at Philadelphia, Francis A. Walker says: "In edge tools the supremacy of the United States is so complete, that, as is well known, foreign producers have been largely driven to imitate the general style of our goods, and even at copy trademarks. 'In the manufacture of steel,' says Prof. Reuleaux, 'the United States takes unquestionably the first place to the Exhibition; in single branches of this manufacture their priority is even absolute. The axes, hatchets, files, the tools for forestry, plantations and gardening, and the like, are presented in such variety and beauty as compels us to stand and gaze with wonderment. The saws, both plain and circular, with all the fine, yea, refined singularities possible in this department, together with steel tools for the mason, the molder, the statuary and the machinist, are of the first order in merit. I will also add, that the larger sawing machines, the cross-saws, the block-saws, and the like, have reached a height of development from which we are still far distant.'"

**AGRICULTURAL IMPLEMENTS IN RUSSIA.**—The United States Consul at Odessa recently wrote to the State Department at Washington that "implements of agriculture might come in great quantities to this country if our manufacturers would make an effort in that direction, and adapt their implements for the use of the peasantry of this country. The principal thing to be done is to make them exceedingly firm and strong. American reapers and mowers are now the favorites above all others, and have a large sale. In other machinery the English manufacturers have the field, and I have seen no article of their machinery that excels the American, unless expensiveness may be deemed an excellence. I am persuaded that there is a fine field here for the American threshing machine."

**A NOISE EXTINGUISHER.**—Everybody that travels has experienced the annoyance of having his ears deafened on board a steamboat by the roar of escaping steam. Sometimes accidents have occurred during the racket of "blowing off" simply because the captain cannot make his orders heard, and everything has to be done in dumb show while the disturbance lasts. Happily, says the *American Manufacturer*, an invention called the spiral exhaust nozzle is destined to choke off the noise. It operates by breaking the waves of sound, the escaping steam being surrounded with a wire helix, and obliged to pass between the wires. These nozzles are in use on steamers running between Philadelphia and England.

**PNEUMATIC HOIST.**—M. Blanchet, the manager of the Epinau collieries (Saone-et-Loire), has sunk a shaft 656 yards deep and placed in it a tube formed of iron plates, in which travels a tightly packed piston capable of carrying on its upper surface a load of 10 tons. When loaded, a vacuum is made above it, and it is driven up, bringing the drawing cage with it. The fuel tips are removed and replaced by empty ones, and atmospheric pressure is applied to effect the descent of the piston. The latter is kept in place by vertical guides.

**TRAIN TELEGRAPH.**—A patent electric system, says the *Railroad Gazette*, has lately been introduced on the trains of the Philadelphia, Wilmington and Baltimore railroad. This system supersedes the present bell and cord arrangement to communicate with the engineer, and also gives a continuous automatic alarm on the locomotive whenever any portion of the train becomes accidentally detached. The arrangement is also applied to freight trains.

**NOVEL PLATE WORK.**—On the 30th of June an exhibition of novelties in connection with the metal trades, more especially plate working, was opened in the Schutzenham at Leipzig. Amongst objects exhibited were a fountain throwing a jet three feet high by means of solidly made clockwork; decorated tinsplate for various purposes, capable of resisting strong heats; wire-inserters, etc. Improved tools and implements of various sorts were also exhibited.

## SCIENTIFIC PROGRESS.

## Moons for Mars.

An astronomical discovery, which is ranked among the greatest of this century, has been made at the observatory at Washington, by means of the new instrument which is called the "great telescope." Accounts which came to hand enable us to compile the following interesting narrative: About 11 o'clock, on Thursday night, August 16th, Professor Hall noticed a very small star following Mars a few seconds, and made an estimate of its distance from the planet. Two hours later he looked again, and was surprised to find that the star seemed to be following the planet. As the distance had not increased, while the planet was moving away at the rate of 15 seconds an hour, he therefore made a careful series of measures, which showed that the satellite was 80 seconds from the planet. An hour later it was still there, but Mr. Hall made no further observation, hardly crediting the great discovery he had made.

On Friday morning he showed his observations to Professor Newcomb, who was so confident that the object must be a satellite, that he calculated roughly the time of its revolution, which he fixed at one day, eight hours, or a little less. This showed that the object would pass behind the planet some time during the following night, and that if not seen in early evening, it would reappear before daylight in the morning. In the evening it was invisible, but reappeared, true to the prediction, about one o'clock in the morning with a companion satellite. Professor Hall had now so little doubt of the reality of the object, that he made the discovery known to Admiral Rogers, the superintendent. It was still thought best to wait for another look before formally announcing the discovery, especially as Professor Newcomb's calculation showed that it would be on the opposite side of the planet on Saturday evening. Hardly was the telescope turned on Mars, when the satellite was seen, and its position determined by several of the astronomers.

Scientific authorities in Washington regard this as ranking among the greatest telescopic discoveries of the century; the only two which exceed it being that of the asteroid group in 1801, and of the planet Neptune in 1846. Professor Hall, the fortunate discoverer of the satellite, has been attached to the observatory since 1862. When Professor Newcomb resigned the charge of the great telescope, in 1875, he succeeded to it. He is an able and learned mathematician, and an unostentatious and conscientious observer. Professor Hall, who has kept continuous watch at the instrument for a week, furnishes the following statement:

"The first satellite of Mars was discovered at the naval observatory, in Washington, on the night of August 16th. It was first seen at 42 minutes past 11 o'clock. It has been observed on the nights of the 16th, 17th and 18th of August. The time of the revolution of this satellite about Mars is about 30 hours. Its greatest apparent distance from the center of Mars is 80 seconds of arc. I think I saw another satellite on Saturday morning about four o'clock, but of the existence of this second satellite I am not absolutely certain. I believe, however, that there are two, and I expect to be able to determine this to-night, as I commence observations again about midnight. The satellite, in its appearance, is a faint object of about the size of a star of the 13th or 14th magnitude, and it was possible to discover it only by putting Mars, which is now exceedingly bright, out of the field of the telescope, so as to get rid of the brilliant light of that planet."

The distance of the first satellite from the planet is between 14,000 and 15,000 miles, which is less than that of any other known satellite from its primary, and only about one-sixteenth the distance of the moon from the earth. The inner one, as to the existence of which the astronomers are not yet absolutely certain, is still closer. The diameter of the new satellite is very small, probably not more than 50 or 100 miles.

The following dispatch announces officially the discovery of the new satellites:

WASHINGTON, August 19th.—Two satellites of Mars have been discovered by Hall, at Washington. First, elongation west, August 18th, 11 hours, Washington time; distance 80 seconds; period, 30 hours. Distance of second, 50 seconds. JOSEPH HENRY.

**MISSING ISLANDS.**—The news of the vanishing of the Barker islands and their inhabitants from the northwestern coast of Australia, says *Iren*, will puzzle those geologists who assume that because a place lies out of a known line of volcanic action, it must therefore be safe. Whatever may be supposed to be the case now, Western Australia betrays many traces of former volcanic action, and the disappearance of the Barker islands can hardly be regarded as a greater marvel than that of Stromboli. It is an unfortunate accident for Captain Fisher—the Tasmanian capitalist, who purchased from the West Australian government the right to remove guano from the islands in question. In April last, he dispatched three vessels with laborers and appliances for shipping the guano; but, after cruising about for some time in latitude 14° S. longitude 125° E., they could not make out the islands, which ought to have been there. How and when the islands disappeared is at present unknown, and it is not very probable that any evidence will be added to that now before the public.

## Venus' Slippers.

Mr. F. Buckland, in *Land and Water*, says: "These slippers are far more beautiful than anything ever yet turned out in the workshop of a London or Parisian ladies' bootmaker. They are found floating far out at sea in the Mediterranean, on the French coast. Each slipper is about an inch and a half in length, and half an inch in the widest part. They are of a lovely glass-like consistence, and in a certain light resplendent like jelly-fish. They are the shape of a handsome shoe: the edge of the shoe projects in a very ornamental dentated margin, and the toe part is highly ornamental, as if with embroidery insertion. Mr. M. Latham says: 'It is a kind of jelly-fish; I have had considerable difficulty in finding out its real nature. At last I ascertained that it is one of the pteropoda, or wing-footed molluscs.' The Rev. J. Wnead writes: 'These are so-called from the fin-like lobes that project from the sides, and are evidently analogous to the similar organs in some of the sea snails. These appendages are used almost like wings, the creature flapping its way vigorously through the water, just as a butterfly urges its devious course through the air. They are found in the hotter seas, swimming boldly in vast multitudes amid the wide waters, and one species (*Clio beredalis*) has long been celebrated as furnishing the huge Greenland whale with the greater part of its subsistence. The scientific name of it is *cymbulia*, so called on account of its being so like a boat.' We read: 'Cuvier describes the *cymbulia* as having a cartilaginous or gelatinous envelope in the form of a boat or slipper, beset with points in longitudinal rows; and the animal as possessing two great wings, which are at once branchiae and fins, and between them on the open side, a third smaller lobe, which is three-pointed. The mouth, provided with two small tentacula, is placed between the wings towards the shut side of the cell, and above are two small eyes. The transparency of the texture permits the internal organs to be distinguished with great facility. The shell is cartilaginous, translucent, oblong in the form of a slipper, and entirely covered with a delicate and scarcely visible membrane.'"

"These slippers of the Marine Venus are so beautiful in form and structure that I propose, if possible, to have a model of them cut in crystal. In the form of ear-rings they would make very pretty ornaments, as showing *chaussure* of Cinderella of the ocean."

## Astronomical Work in Washington.

The editor of the *American Manufacturer* has made "an excursion" to Washington and took these notes: "We visited the Naval Observatory, and saw there several objects of interest. Among them was the equatorial telescope, said to be the largest in the world. It is 32 feet 8 inches in length, with an object glass of 26 inches in diameter, clear aperture. It was made by Alvin Clark, of Cambridge, Mass., in 1873.

"We saw there also the standard astronomical clock which keeps the time for the Observatory, and from which Washington mean time is telegraphed every day to all parts of the country. To keep this clock from sudden changes of temperature it is inclosed by a thick wall of masonry, and to keep the wall free from moisture a coal fire is constantly kept burning in the room.

"The records of the transit of Venus are being worked up by the officers in charge of the Observatory. Few have any idea of the immense amount of labor expended in this direction. It includes microscopic measurement of a large number of photographs of the transit, which have to be made with expensive and complicated apparatus especially designed for the purpose. Most of this apparatus is entirely novel, and is the invention of Prof. William Harkness, who was one of the chief officers of the transit expedition. The chronometers used by vessels of the navy are all tested and their rate of error recorded at this Observatory. We saw a large number of these instruments, which were made by the principal manufacturers of this country and Europe, and were told those made by a certain firm in New York are superior in every respect to those of foreign manufacture."

**NORRENSKJOLD'S NEXT EXPEDITION.**—For Professor Nordenskjöld's expedition, which is to set out from Gothenburg, in Sweden, in June, 1878, a vessel has already been chartered for 150,000 Swedish crowns (about \$25,000.) King Oscar has contributed 50,000 crowns from his personal revenue, but the burden of the expense will be borne by the friend and patron of Nordenskjöld, a merchant of Gothenburg named Dickson. The route of the expedition will be from its starting point to the North Cape, thence eastwardly through the Polar Sea to and through Behring's Strait; thence along the eastern and southern coasts of Asia, through the Red Sea, the Suez Canal, and the Mediterranean Sea to the Atlantic Ocean, and return home in the autumn of 1879. This looks like a voyage of general discovery, and if the North Pole should be struck, all the better. He can hang the Swedish flag upon it.

**SPECTRUM OF ELECTRIC LIGHT.**—M. P. Desains finds that the spectra of electric light are very similar to those of the solar rays. They are less extensive, particularly on the side of the violet; but the curves of intensity exhibit but slight differences in the region of greatest heat.

Table of Highest and Lowest Sales in S. F. Stock Exchange.

Name of Company.	Week Ending Aug. 16.	Week Ending Aug. 23.	Week Ending Aug. 30.	Week Ending Sept. 6.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**Estimate.**—Amador Ledger, Sept. 1: The Eclipse mining company will soon resume work. The hoisting works are now being put up. The engine and everything is on the ground, and five carpenters are at work. Soon we will have another steam whistle in the heart of Amador City. The stockholders are all elated.

**Ministry.**—Matters have advanced another stage in connection with this mine. The former made arrangements some weeks ago to have a quantity of the rock crushed at the Onida mill, and actually hauled about 50 tons there for that purpose. The batteries were started on the rock last week when the United States Marshal appeared on the scene and put a stop to the milling of the ore. This action effectively disposes of the idea of the speedy starting up of the mine. Everything is now held to a standstill, awaiting the decision of the courts on suits pending.

**Mills.**—Most of the mills throughout the county are now idle for want of water. The Plumbly, Glover, Hunker Hill and Original Amador are all shut down. The Amador Co. is running only 20 stamps. The Keystone is still running to its full capacity, having the water to the water, but it is probable that it will have to hang up its stamps for a season, or else take to steam.

**Improvement of the Canal.**—The Amador Canal Company intend to remove the pipe which now crosses Sutter creek about two miles above town, and which carries water over to the Glover, Hunker Hill, Original Amador and the mines of that vicinity. The new pipe will run through the town of Sutter Creek, within 150 feet of the Wildman mine, by the Maloney and Lincoln, and supplying the Tallman and Keystone. The pipe will be 200 feet lower at one end than the other, thus giving a good pressure. Another pipe will be laid across Amador creek to the ditch of the Original Amador, supplying the Glover, Plumbly and other mines with the essential liquid. These improvements will do away with 17 miles of branch ditches, and thus prevent evaporation and seepage incident to open ditches, besides giving an increase of pressure. Men will be put to work on this undertaking forthwith.

**Shut Down.**—Amador Dispatch, Sept. 1: We learn that the Amador mine at Sutter Creek was compelled to stop running, temporarily, last Tuesday evening, owing to a lack of water. The stoppage, however, will only be for a short time, as they are preparing to run by steam, in case a fresh supply of water cannot be had.

### BUTTE.

**Good Luck.**—Orville Mercury, Sept. 1: We are much pleased to learn of the good luck that has attended the labors of the miners on the middle fork of Feather river. A party at work in the river near the Mountain house have struck it rich, and are taking out a large quantity of ore. Should the mine hold out until late they will have enough to make every one of them a good stake. Other parties are doing well and making money fast.

**Mining to Some Purpose.**—Mrs. J. T. Rhoads, of Magalla, in company with her husband and two other gentlemen, took out for the Union claims, west branch Feather river, \$125 per day for 12 days in succession, the nugget weighed over seven ounces, and the end is not yet.

### CALAVERAS.

**Strike in the San Bruno.**—Calaveras Chronicle, Sept. 1: We are pleased to learn that a large body of rich ore has been struck in the San Bruno mine at Mosquito, upon which work was recently resumed. The ore body has been uncovered in the 325-ft east level, the vein showing fully three feet wide. The new proprietors of the mine are very much elated with their prospects, and are pushing development vigorously.

### INYO.

**In Operation.**—Inyo Independent, Sept. 1: The Beauty furnace, of the Union Consolidated works at Cerro Gordo, is in operation, running on silver ore from the San Felipe ledge, and iron and low-grade lead ore as flux from the old Union mine, which mine was not affected by the fire that destroyed the hoisting works.

**Cerro Gordo.**—By announcement, it will be noted that the Beauty furnace will receive gold and silver ore for reduction. The new Superintendent and the foreman of the mill are men of unquestioned ability and thoroughness in their calling, and now it behooves our mine owners to get out ore and realize on it—or at least ascertain its worth by actual working.

**Estimate.**—Superintendent Rickards has closed down the Beauty works, and for the present will confine operations to work at the bottom of the mine, intending to sink 100 feet further before opening new levels. The ore at the bottom is of a better quality than elsewhere in the mine; besides, we understand, the upper levels have been pretty well worked out, necessitating the opening of new ground.

**Rex Montis.**—The Rex Montis mill question has been settled by the purchase from Messrs. Harris & Binn (who hold under Sheriff's deed) of the entire property of the Silver Sprout company, including the mill, the Silver Sprout and the Lamb mines, with other ledges and the ranch, the purchase price of the whole being only \$8,360—probably the lowest sum ever paid for so valuable a mining property. The Rex Montis men have improved the mill above to the extent of \$5,000, which amount would have been lost had the purchase not been made. Under Superintendent Hutchings, he having authority from the company to go ahead in full force, the Rex Montis will soon rank second to none of the "outside" mines. As to quality of the ore, the hullion shipment of the season from the little mill best speaks for itself.

**Travay.**—Coso Mining News, Sept. 1: The winze is now 20 feet in depth, and from this point the miners have started north and south on the body of ore discovered 10 days ago. The ore recently discovered below the vein, carrying gold and silver, proves to be rich in lead as well as silver, which facilitates smelting operations, that will be commenced at no distant day. Mr. Rodda is adding to his working force as fast as men can be added to advantage.

**Coso Co.**—The prospects of the Coso Co., as we learn from the Superintendent, are now more and more flattering than ever. A large deposit of fine caliche ore is being opened up in the lower workings of the mine, which, so far, proves superior in quality to any heretofore found. The extent of the discovery cannot yet be determined with accuracy, but the prospect is certainly favorable for a large deposit, and, being at the lowest point yet reached, is very encouraging for the future permanency of the mine.

**Monoc.**—From reliable parties in from Lookout, and who are in a position to know whereof they speak, we learn that the Modoc furnaces will again be started on the 10 inst. On account of the extreme dry season, their water supply has been short, but they find, as the fall season approaches, that their springs are increasing in volume.

### MONTEREY.

**Quicksilver.**—Salinas Inter, Aug. 30: The Salinas quicksilver company have invited an assessment of six cents per share. It is supposed by the officers that this is all the assessments that will be required to open the mine. The lower tunnel is in 320 feet, and 30 feet more will complete it so that it will be directly under the shaft. It is then necessary to raise 60 feet to connect with the shaft sunk from above, when the company will commence stopping out and shipping ore at once. The tunnel is just tapping the wall rock of the ledge, and everybody is full of jubilation over the prospects of the mine.

### NEVADA.

**An Extensive Slide.**—Nevada Transcript, Sept. 1: A few days ago an extensive slide took place in the Blue Bank, Oriental, NIX and Boston gravel claims to Washoe's Flat. The Blue Bank was almost ready to disintegrate and it was estimated that from \$200,000 to \$300,000 would have been the result of their work; but the cave came and buried it all up, besides the boxes, pipes, etc., and it is said the cave is so extensive it will take over one year to reach the boxes that contain the gold. The bank where the cave occurred is about 400 feet deep, and the slide extends about one-half of a mile in length, over the Blue Bank, Oriental, NIX and about that much of the Boston claims. The Blue Bank is owned by Jay Reed, Wm. Rankin, Sam. Mills and Wm. Price; the Oriental by Frank Henry & Co., the NIX by Marks Zellerbach, and the Boston by Marks & Magarity. The damage done cannot be estimated by dollars and cents at the present time. The Oriental and NIX were not being worked at the time the slide occurred. These are all the particulars we could obtain.

**The Missouri Mine.**—Nevada Transcript, Sept. 1: We were shown, yesterday, a bar of gold weighing 31 ounces, which was the result of six tons of rock taken out of the ledge known as the Independence. This quartz was taken out of one of the upper levels. Where most of the work is being done under the ledge is about 15 inches thick and is being done in the Independence. It is thought that the ledge will pay from \$60 to \$70 per ton. Everything is going along nicely in all parts of the mine, and the prospects of the company were never better than at present.

### PLACER.

**Stranger than Fiction.**—Placer Argonaut, At the Rising Sun mine, near Colfax, a most extraordinary accident occurred the other day. As four or five miners were being lowered into the shaft, and when yet but a short distance down, one of them, a Cornishman, named John Tate, put out his foot against the side of the shaft. While the bucket was rapidly descending. A moment later his companion were horror-stricken to find that he had suddenly disappeared in the darkness. When they reached the bottom they looked around for his mangled remains, but no trace of him was to be found. This was mysterious. They could not believe their senses. A feeling of superstition came upon them. There seemed to be no possible solution of the strange disappearance, because the body of the miner had not been seen, or, very nearly so, on the return of the skip to the surface. The body was found, hanging head downward, his feet firmly caught in the crevice of one of the timbers. His head was seized as with a giant's grasp, and there the poor fellow hung by one leg, with nothing but space and darkness intervening between him and the bottom, 500 feet below. He was unhurt. This is what may properly be called a miraculous escape.

### SIERRA.

**Golden Star.**—Mountain Messenger, Sept. 1: It is reported that the Golden Star tunnel is into gravel. They had only a short distance to run about a week ago. Placers.—Pipelay has been struck in the Ploocene shaft, at a depth of 180 feet. This has been penetrated some 40 feet at the time we go to press, where a stratum of clay, quartz pebbles and wood has been struck.

**Completed.**—The boys have finished their contract for sinking for piers for the bridge, getting down to bedrock in every instance. Two of the hents are in place and the framework of the bridge is advancing. It will be a substantial structure.

**Silver.**—We are advised of the existence of and been shown rock from a ledge not more than three miles from this place, which assays \$22.40 in silver and \$15 in gold. We should like to see work begin towards developing that ledge.

**Developing.**—The Virginia company are about to commence sinking a shaft on their claim on the ridge above Forest City, somewhere in the neighborhood of Milton, as near as we can locate it. They will put on heavy machinery and go down rapidly.

## Nevada.

### WASHOE DISTRICT.

**Cos. Virginia.**—Gold Hill News, Sept. 5: Daily yield, 500 tons of ore. The mills are all steadily running, and the billion yield for August is amply sufficient to insure the payment of the regular dividend of \$2 per share, on the 5th. The ore stops on the 1,200-ft level are opening out nicely and are yielding rich ore. The ore on the 1,300, 1,400 and 1,500-ft levels are also looking finely and are yielding rich ore. The ore stops extending southward on the 1,500-ft level are showing a decided improvement. On the 1,650-ft level the ore stops are being gradually extended to the southward, the ore being very uniform in character and of a very rich quality. A broach drift has been started south from the main west drift from the C. & C. shaft, on the 1,550-ft level, to strike the south end of the ore. The ore stops are being extended southward on the 1,550-ft level, the north drift on the east side of the ore vein is slowly advancing, the heat in the face being fearful. On the same level, the west drift from the C. & C. shaft and the east drift from the bottom of the double winze have completed a connection, showing 81 feet of good ore from the center of the winze to the east side of the ore vein. A drift south from the bottom of the winze on the 1,700-ft level is being pushed vigorously ahead to complete a connection with the north drift, from the Gould & Curry, on the same level. The face of this drift is in rich ore.

**California.**—Daily yield, 800 tons of ore, keeping the mills all steadily running. The billion yield for the month of August is fully up to the usual high standard and insures the payment of the regular dividend of \$2 per share. The largest amount of the 1,550-ft station of the Consolidated shaft is completed, ready for the extraction of ore from that portion of the mine again. Cross-cut No. 4, below the 1,500-ft level, is being pushed vigorously forward. The ore stops on the 1,550-ft level are showing splendidly. The ore stops on the 1,600-ft level are yielding rich ore, which is growing richer as the sill floors are extended to the southward. Forty feet south of No. 3 winze, a cross-cut is being run in the ore body to the eastward, proving the ore beyond doubt to be of a very rich character. The air connection between winze No. 4 and winze No. 5, on the 1,600-ft level, has been completed, and greatly assists ventilation. The ore stops on the 1,650-ft level are yielding splendid ore, and are being gradually extended to the southward, yielding No. 3 winze below the 1,650-ft level is making good progress. The bottom still being in rich ore. Taken together, the ore prospects of the mine were certainly never better. If equal, in the past, to the showing that is now exhibited.

**Julia.**—The east drift from the east winze, on the 1,800-ft level, has penetrated into a much softer and more favorable formation of clay, porphyry and quartz, with the encouragement of the water reaching the east ledge. A cross-cut—No. 8—is now being run to the westward from the main south drift, on the 1,800-ft level, the last 15 feet of which has been in quartz and ore of a softer and better character than any before found in the mine. Along with this ore a strong flow of very hot water was struck. The water is scalding hot, having a temperature of 200° F. and is increasing in volume. The water is said to be increasing in amount.

**Alta.**—The west drift, on the 1,650-ft level, has been driven 150 feet to the westward, at which point the east clay wall of the ledge, carrying large stringers of quartz and ore, was encountered, and a flow of water so strong that it was deemed advisable to not tap the ledge until the justice drift, on the opposite side, 300 feet further to the southward, should draw the water, when both mines would take it together and make the job of draining the ledge much lighter than it would be for one mine to do it alone.

**Homesstead.**—Sinking the main working shaft is steadily progressing, continuing in a mixture of porphyry and clay, carrying a large amount of iron ore, and a low temperature, indicating increasing value as greater depth is attained. The flow of water is light.

**Utah.**—Sinking the incline winze below the 1,150-ft level is going vigorously ahead, the rock in the bottom still being quite hard.

**California.**—The west crosscut, on the 1,600-ft level, has reached the west wall of the vein, and shows it to be of great width and of a fine and encouraging character. A following it to the northward.

**Justice.**—The east cross-drift at the 1,150-ft level is advancing in what is considered to be the outcrop of the main ore channel. Strata and bunches of good ore have been met with, and an increase of water, but the winze sunk from the level above shows but little drainage as yet. The daily ore yield of the mine is 350 tons, and the various ore stops on the 500 up to the 500-ft level are looking and yielding fine ore as usual.

**Union Co.**—The east drift on the 1,300-ft level during the past week struck an entirely new character of ground, the hard rock in the face changing to a soft porphyry and clay, carrying streaks of fine looking quartz. This discovery is entirely to the eastward of anything of value previously developed in the mine, and when taken together with the fact that the water has ever been struck in the old west prospecting drifts, and that there is no flow for the first time a strong appearance of water in the face, leads to the belief that all the former prospecting in the mine has been done too far to the westward to be successful.

**Sierra Nevada.**—The south drift from the upraise on the 1,400-ft level is rapidly advancing, the face in good working ground. The drift is being pushed forward with interest in the mine, as it is intended to connect with the north drift on the same level from the Mexican for ventilation, and no cross-cutting of much consequence will be attempted until the drifts are connected.

**Yellow Jacket.**—Main east drift at the 2,200-ft level is in good face in porphyry with seams of quartz carrying ore. The work is being pushed forward with interest in good sinking ground, and water still on the decrease.

**Imperial.**—The main cross-drift, east at the 1,700-ft level is pushing ahead in good looking vein matter, and the combination drift at the 2,000-ft level, running north from the Imperial, is showing very encouraging indications in its face.

**Union.**—Both the north and south drifts on the 1,000-ft level are being pushed vigorously ahead in a favorable ground. At noon to-day a cross-cut was started directly east from the 1,000-ft station to cut and prospect the ore vein. This is a very important drift, as it will in all probability reach the vein in a very short time, and will penetrate it almost in the very heart of the mine.

**San Jose.**—The new working shaft is now down about 125 feet, altogether in very promising quartz, just within the east wall, which it has been following for the last 50 or 70 feet.

**Mexican.**—The north drift on the 1,455-ft level, running to connect with the south drift from the Sierra Nevada, is making the best of headway, and will without doubt be able to make the connection by the end of the present week. The work is now as near each other that they can distinctly hear each other. The face of the north drift on the 1,600-ft level is in much softer and more favorable ground, with increasing ore prospects. Sinking the joint incline winze on the Diphir line, below the 1,700-ft level, is making good progress.

**Imperial Co.**—A drift has been started to the eastward on the northern boundary, and a station is now being cut out to start a joint winze on the Alpha line, which will be sunk to the same level as the bottom of the south winze, and then connected with that winze by a lateral drift.

**Overman.**—The east drift on the 1,300-ft level is steadily advancing, the face in a very good character of quartz. A drift has been started southward on the ore vein on the 1,400-ft level to connect with the California.

**Gould & Curry.**—Sinking the main incline is going rapidly ahead, the bottom in hard blasting rock. The south drift from the bottom of the winze, on the 1,600-ft level, is steadily advancing, to connect with the bottom of the Savage combination winze on the south line.

**Belcher.**—Sinking the main incline is going steadily forward, the flow of water in the bottom still being quite strong.

**Leviathan.**—Face of south drift at 600-ft level all in loose grade ore, with occasional streaks of porphyry; constant improvement in the face of the drift advances.

**Citadel-Potosi.**—Daily yield, 30 tons of ore, the assay value of which is \$23 per ton. The east drift on the 1,800-ft level is steadily advancing, the face in good running ground. This drift is very hot.

**Savona.**—Considerable trouble has been experienced during the past week with the pump rods, which has prevented the water from rising in the shaft a number of feet, which is not yet any lower than it was a week ago.

**Silver Hills.**—The water in the shaft appears to be slowly decreasing of its own accord, being now several feet below the highest point that it reached after the breakage of the pumps.

**Crown Point.**—The south drift on the 2,000-ft level is making the best of progress, and will connect with the bottom of the double combination drift shaft some time during the coming week.

**Sutton Tunnel.**—Very good advancement continues to be made in the header, the face being in soft ledge porphyry, clay and quartz. No increase of water.

### BRISTOL DISTRICT.

**Royal City.**—Ploche Record, Sept. 1: A mining excitement, which, for the size of Ploche, is of considerable magnitude, is being created about the Jackrabbit mine and its adjoining claims in the Bristol mining district. Hardly a day passes but what some parties visit that mine, and parties start out in that neighborhood to prospect for its supposed concealed wealth. Quite a number are now out there; some having mining locations on which they are working, whilst others are prospecting for same. Wagons go out loaded with provisions, tools and other necessities for a mining camp; and daily, on Wednesday last, Oscar Westcott was employed by some parties to go out there, select a town site, survey the same, and to do the work necessary to hold it. This was done; the work of surveying being completed on Wednesday, the map being completed and recorded on Thursday. The place is now known as "Royal City."

**Mayflower Mine.**—The Mayflower mine, at Bristol district, near the H. H. mine, which has been started on a visit to on Thursday last, is turning out ore rapidly, the ore being of a high grade and supposed to be good milling ore. The best is being sacked. Work is progressing rapidly under the charge of Frank Wheeler, and everything looks well for the prospects of the mine.

**Nor Wagoner Yet.**—Curiosity will have to remain unsatisfied for a few days longer in regard to the character of the Jackrabbit mine, as the working of the 10 tons at the American Flag mine is not completed to date.

### ELY DISTRICT.

**Refuge to Pay.**—Ploche Record, Sept. 1: The billion tax on the proceeds of the mines for the quarter ending June 30th has not been paid, and the Attorney General, according to the orders of the District Attorney, according to the rate of taxation levied on property within the fire limits—that is, at \$4 upon every \$100. This addition the mining companies claim to be unjust, and they accordingly refuse to pay; they, however, tendering the amount that they claim is right, according to the way the tax has previously been collected on the mine. The result is that there is every show for a long lawsuit, without the County Commissioners take the matter under consideration at their meeting next Monday, which we understand they intend doing.

**Alta S. M. Co.**—Considerable ore has been raised during the week. Trains are running three times per week from the N. C. R. R. to the mine at Lookout. The vein of good ore still continues in the drift running west from the winze between the 9th and 10th levels. The mill at Rollinville is running steadily and doing good work.

**Ramona & Ely.**—The lower level is looking favorably and the work progressing well. On the 6th level there is a nice improvement in the ore stops, working in a vein of high grade ore, and the water is being raised to the work crushing ore a week in advance of the time that was intended, owing to the ore dumps being crowded with ore, over 800 tons being on hand.

**Culimino.**—Billy Miller and some other miners are

making arrangements to start work on the Huhn & Hunt lately known as the Nevada mine.

## Arizona.

**Tyndall District.**—Cor. Arizona Citizen, Aug. 24: Deer Lodge is a beautiful little camp situated on a creek flowing south from a peak known as the Bailey and Hopkins peaks, and about four miles north of the Arizona coast. There are a number of valuable holes already discovered in the district. Of the mines, the Josephine and various ore stops on the 500 up to the 500-ft level are the largest; these have a dip of 50 feet deep and 10 to 15 feet wide; cropping 20 feet high. The ore dumps of ore on the dump. In the former working on this ledge the ore was packed to a distance and is supposed to have been worked at the Tumacacori church. The shaft will tap the lead 160 feet; there are several thousand tons of ore in sight. Next comes the Hidalgo and Talach mines. These are very promising locations, the ledge being from three to four feet in width, carrying carbonate ore. They comes the Magdalena, with work performed, showing a vein of two feet of chloride ore, with four or five tons on the dump; owned by Messrs. Roddick, Luck and Britton. Messrs. Kimberley and Luck own some of the ledge, with work done on them. One of these, the Kelly, is a pretty little ledge, 18 or 20 inches of chloride ore. Another is called the Morrill. On this ledge are down 12 feet, showing two feet of carbonate ore. Then comes the Kiedly, down 14 feet in hard green and yellow ore, containing carbonate and horn blende; three tons on the dump. Next comes the Joy of it, the Ledilla, having four or five tons on the dump. The vein is three feet through and no waste ore, carbonate, which would smelt into lead, owned by the Kiedly company, Roddick, Luck, Britton & Britton. Messrs. Sam Adams and Roddick have a new location, the croppings of which look well and are of a copper-stained ore. Mr. Adams owns three or four locations, but they are not sufficiently prospected to tell how they are at work. There are many locations here not yet opened, and you can't tell what they may be inside. The old mines, Cacho and Tumacacori, have been closed out and show milling ore of a chloride nature.

**Discoveries.**—Arizona Miner, Aug. 21: During the last 10 days, many very valuable mines have been discovered by the prospectors in the various districts. Ore is being taken from the Perry mine, Hassanyama district, in the south of the county, which is really a marvelous discovery, thousands of dollars worth of ore, the richest of the ore is being sacked, preparatory to shipping to San Francisco for sale. A tunnel is being run into the side of the mountain, which will strike the lead 150 feet under ground, when the owners will realize that they have a bonanza of untold value.

**Lyons Creek.**—Over in the Lyons Creek district, the Zalida company continue to work their mine with the usual good results, taking out rich chloride ore from the bottom of the 70-ft shaft that assays several hundred dollars per ton.

**Big Run.**—Big Run several mines are being worked and are yielding their owners handsome profits.

**Pack.**—The Pack mine, in Pack district, keeps a host of men at work, and their Aztlán mill is steadily pounding away and turning out about \$10,000 of chloride ore per month. Their new 10-stamp mill will be on the ground, and men are employed hauling brick, hauling lumber out, etc., to be used in its erection; and, within 60 days from date, they will be putting forth to the gaze of the faithful Arizona, at the least calculation, \$2,000 per day from this, one of the most wonderful mines of the present period.

**Bradshaw.**—In Bradshaw and Bradshaw the outlook is bright, and a great yield of ore is looked for from these districts as soon as sufficient rain falls to supply the water wherewith to run the quartz mills now standing idle for the want of that element.

**Globe.**—In the Globe, ore continues to be found equally rich as those found in the Richardson, at White Pine, a few years since. Much of it will assay \$20,000 to the ton.

**Pima County.**—Pima county is booming, and the interest taken in her by capitalists from all sections, who are willing and anxious to invest in the rich silver deposits that abound in great numbers within her borders, is evidence conclusive, to the unprejudiced, that Southern Arizona is unsurpassed in mineral worth. The same can be said of Mojave county, with her famous McCrackin, Hupe, Keystone, Hackberry and the many other excellent mining property scattered here and there. In every nook and corner from the line of Yavapai to the Colorado, quartz mills are going up like magic, and within 60 days the shipments from that county alone will surprise the outside world.

## Montana.

**Silver.**—Lute's Miner, Aug. 29: Last Sunday the owners of the Little Appleton Spar shipped to Corbino, from that claim, 30 tons of first-class silver ore, that will yield about 300 ounces of silver per ton.

**During the last two weeks, W. A. Clark has had 500 sticks of mining timber delivered at the different mines in which he has been interested. Upon several of these claims that have now been idle for a long time, work will soon be resumed.**

**Copper.**—We have lately been shown some very fine specimens of argentiferous copper ore, taken from a hole recently discovered in the Silver Lake district. This hole is not very far from the celebrated Silver Moss lode. The ore shows a trace of antimony in addition to the silver and copper, and is free milling to such an extent that it can be worked by mill process within 167 of its value.

**Silver Lake.**—The Monroe mill, of Dewey's Flat, as we learn from the Superintendent, Mr. Logan, has lately been employed upon ore from the Mammoth lode, belonging to Brannigan & Patton, and with more satisfactory results than ever obtained before in the Vipond district. Tom Manning, who went some time ago from Butte, to take several of the men of the Mammoth lode, has returned with the most gratifying success in the use of the new Parvane pan, and is working the ore of the Vipond district to so close an approach to their assay value that all parties interested are more than satisfied with the results.

**Parvane Parvane.**—The inventor of the new celebrated Parvane pan, we learn that Noah Armstrong, of Butte, is working the Mammoth lode, has completed his new smelter and will put it in operation this week. The working capacity of the new furnace is 50 tons per day, and, as soon as it gets fairly at work, there will be a steady demand from Glendale for the silver and copper ore of Butte. The silver ore needed are the base manganese ores that cannot be worked here at the mills, and for them, Mr. Armstrong will pay at the mine a higher percentage of their assay value than the mills can afford to pay for free milling ore.

**Losses of the Dexter.**—Last week the final clean-up, preparatory to the sale announced to-morrow, was made in the Dexter mill, and 13 tons of billion, valued altogether at \$8,500, cleaned up. According to the Trustee's sale, published in another column, the mill, together with several mining claims, was sold for \$10,000 to-morrow, but we just learn that Mr. Parlan has applied to the Court for a stay of proceedings, and that the issue between himself and W. A. Clark will likely go into court and be adjudicated upon before any disposition can be made of the mill or mines. Pending the decision of the suit, the mill, we suppose, will stand idle. This we consider a great misfortune.

## Oregon.

**Monterey.**—Grant County Times, Aug. 31: Development have greatly strengthened the confidence we have ever reposed in the Monterey, and the prospects to-day are more flattering than at any time since the ledge was struck. The progress of the tunnel is now watched with exciting interest. Five very promising ledges having been cut thus far, while the most promising ledges still remain uncut. In passing through these ledges, no foot wall was found until the last one was tapped, showing conclusively that this vast amount of ledge and ledge matter is the same ledge, and when the several ledges are struck, a six-foot ledge will be the result. The discoveries made on the surface have resulted very satisfactorily, and have demonstrated the fact that the entire bill is one vast chimney of fabulously rich ore.

## Idaho Mines.

The Idaho *World* speaks as follows of some of the quartz mines of Boise county:

In 1867, Wm. Lent and others put up a 25-stamp mill at Quartzburg, for the purpose of working a ledge that, in a short time, proved itself to be a balk, and work was suspended. The mill was afterwards purchased for an insignificant sum, \$15,000, by Mootry, Lynch, Coughanour, Molony and Johnson, and work commenced on the Gold Hill mine, situated in close proximity to the mill. This was in 1869. Mr. Lynch sold out the year following, and gradually the entire stock became the property of David Coughanour, Thomas Mootry and William Coughanour, and, by strict business management and economical working, has never failed to be a dividend-paying institution. The mill has run continuously for eight years, with the exception, if correctly informed, of a few months last year, when a level was being sunk, never failing to pay handsomely, and making the owners independent. Until within the past two years, the ore has been conveyed from the mine to the mill through a tunnel; but recently a shaft has been sunk 100 feet below water level, and hoisting works erected, by which means the ore is brought to the surface, when it is run into the mill on cars and dumped in front of the batteries. About 50 tons are thus brought to the surface and worked every twenty-four hours, although the vein is no more than 10 or 12 inches wide, and only about 50 hands employed in extracting and reducing, the whole cost of which does not exceed six dollars per ton, the ore containing free gold, and being easily extracted without the use of powder. There are no useless men under pay about the works; no superintendents dashing about, wearing kid gloves and riding yellow horses; no supernumeraries of any kind. Wm. Coughanour, with the assistance of a foreman in the mine, superintends the entire business, and everything runs like clock-work. How long this mine may continue to yield up its treasures no one can tell. The bottom has never been seen, and there are no indications of the beginning of the end.

## The Eisler Mine

Is exactly like the Gold Hill, being a continuation of the same lead, being the same size, with the same kind of ore and the same bedrock. It has not as yet got into successful working shape, but will not fail to be a fine paying property.

In years gone by, large sums of money have been made in a small way in extremely rich mines at Summit Flat, distant from Quartzburg ten miles, and from Idaho City fourteen miles, making a kind of triangle. They are distant from the Sub Rosa and other rich mines, located in the Gambrinus district, about six miles. The owners of these veins worked a little ore convenient to the surface, but when machinery was required to go down and work it systematically they ceased operations, and now a fine field is lying open at Summit Flat for the investment of a little capital. There is a quartz belt of eight or ten miles in width, commencing at Summit Flat and running south through the Gambrinus district towards More creek, unexcelled in rich croppings; with some of the veins, as shown in our last week's report, true fissures, and doubtless continuous in depth. We predict that Boise county will take and maintain a high stand as a quartz district in a very short time. Our mines paying from the surface enables the companies of small means to operate; and they are so easy of access that the cost of placing machinery is light, compared with other districts. Several men who have been struggling in poverty for years have, within the last six weeks, acquired property by discovery that large sums of money would be required to buy. This is also the case with the discoverers of the Sub Rosa, only the discovery was made two years ago.

## Artificial Gems.

Young and old, of all ranks, have admired the brilliant transparency of the diamond, the purple of the ruby, the blue of the sapphire, the green of the emerald, the orange tint of the hyacinth, the transparent blood-red of the garnet, the variegated tints of the agate and porphyry, and the delicate subdued whiteness of the pearl; and we can scarcely wonder that a desire for preparing imitative copies of them should spring up.

When glass contains certain metallic particles, says the *British Trade Journal*, they usually impart a tint of color to it, varying according to the nature and quantity of the metal; in the plate and crown-glass manufactures, metallic oxides are always used to counteract the coloring effect of other ingredients, by tending to impart a different tint, the combined effect of the two producing colorless transparency. Now as this property of metallic particles must have been known from the first epoch of the glass manufacture, it required but another step to make it available for the production of imitative gems.

About the year 1665 Andrew Cassius, physician to the Bishop of Loubeck, devised a mode of imitating rubies in a more perfect manner than had been before known. This was by dissolving gold in a mixture of muriatic and nitric acids, called *aqua regia*, or royal water (from the circumstance of it being the only solvent then known for gold), and then precipitating it by a solution of tin, by which a purple-colored powder was procured. This powder, which, from the inventor, has been called "purple precipitate

of Cassius," was then incorporated with transparent glass to form the imitative rubies. At a later period John Kunkel improved this manufacture, and made for the Elector of Cologne a cup of ruby-glass, weighing 24 pounds, a full inch in thickness, and of an equally beautiful color throughout.

At all times a brilliant red has been more difficult to impart to glass than most other colors. The greens, blues, etc., require less care in the preparation; and consequently the appearance of the greater number of gems has been imitated with considerable success. It is impossible for us in this place to detail the various processes by which this has been effected; for such details have enabled M. Fontanieu, to fill a large octavo volume. We can only glance at the most prominent facts.

What we popularly call paste is technically known as *strass*; this is also the French word for the same substance (from M. Strass, its reputed inventor). Paste, then, is a material with which diamonds are imitated, and by mixing up with it metallic oxides of various kinds, colors in great variety are imparted to the paste, by which it serves as a representative of the various colored gems.

Strass is prepared, according to the method of M. Donault, who has attained great proficiency in this art, from silica, potash, borax, and oxide of lead, and sometimes arsenic. Rock crystal and flint consist almost entirely of silica; but as flint generally contains a little iron, the silica obtained from it is liable to have a tinge of color which is detrimental to the fidelity of the imitation; rock crystal is therefore employed.

The crucible in which the materials are melted claims particular attention, since, if the substance of which it is formed contains metallic particles, color would be imparted to the strass. Hard porcelain and Hessian clay are the best materials for this purpose. When the crucibles are supplied with the proper quantity of ingredients, they are placed in a porcelain furnace, where they are exposed to a steady heat for 24 hours, and then allowed to cool very slowly, so that a kind of annealing goes on. By this means is produced a strass, or paste, which, after passing through the hands of the lapidary, who gives it the form necessary for "setting," presents us with an imitation of the diamond.

Having once produced the strass which imitates diamond, all other gems may be imitated, by mixing with strass various metallic oxides and other substances, according to the color it is desired to produce. Herein is manifested great diversity of opinions, different experimenters advocating different modes of procedure and different ingredients. One experimenter recommends the following ingredients: To imitate topaz, add glass of antimony, precipitate of Cassius, and oxide of iron, to the white strass; for ruby, add oxide of manganese; for emerald, oxide of copper, iron, and chromium, and acetate of copper; for sapphire, oxide of cobalt; for amethyst, oxides of manganese and cobalt, and precipitate of Cassius; for heryl, glass of antimony and oxide of cobalt; for garnet, glass of antimony, precipitate of Cassius and oxide of manganese.

M. Donault has given directions somewhat different from the above; but we need not particularize them, as it would carry us into too minute details. We may, however, mention that he produces the imitative rubies by a particular treatment of the composition employed for topaz. This composition is 1,000 parts of strass to 40 of glass of antimony and one of purple of Cassius; at a certain stage of its preparation it affords an opaque mass, translucent at the edges, and affording thin laminae of a red color. A part of this opaque topaz matter, added to eight parts of strass melted in a Hessian crucible, and left 30 hours in a potter's furnace, affords a beautiful yellowish crystal. If this crystal be remelted by means of a blowpipe, it produces a strass nearly equal to the finest Oriental rubies.

The art of producing imitative gems, ingenious as it is, is necessarily a confined one; for as soon as faithful copies of certain jewels are obtained, the object of the art is attained. The object is to deceive the eye; for as M. Dumas remarks, "the most perfect description of strass, if it imitate no particular and identical gem, has no value, because it deceives nobody."

**SANTA CLARA PETROLEUM MINE.**—The shareholders in the Santa Clara Petroleum Company transferred their stock to a party of Eastern capitalists, represented by an agent in San Francisco, last Wednesday. The transfer was made reluctantly, and only because certain of the shareholders were unprepared financially, we suppose, to work the mine to a successful termination. Of late days not much work has been done, and the mine has been developed to but a very small extent, although there is every indication of paying oil being in large quantities. The new company, under the same corporate name, backed by a large amount of capital, will prosecute the work on a more extensive scale, and will soon have the mine well developed. The new company has purchased all of the land adjoining the mine which could be purchased, and will soon erect their works. The mine is situated about 15 miles from Santa Clara in what is known as Moody's gulch. The existence of petroleum in that locality has been no secret; on the contrary, it has been known for years, and an attempt was once made to mine for it. The work of doing so was hadly conducted and the enterprise given up as a failure. This second attempt, however, has every indication at present of being successful. —*San Jose Mercury.*

## Prospects in Arizona.

The *Arizona Citizen* says: The average indications are in favor of a prosperous future for most parts of Arizona. We listen with great care to the many reports as to what is going on and what advancement is being made, and there seems no doubt but the future of mining, stock-growing and tillage of the soil in Arizona is encouraging. This is a year of excessive drouth all over the Pacific coast, and Southern California especially is suffering for want of rain. The late crops in the Salt and Gila valleys, we are informed, will be partial failures, except in the Upper Gila in this county, where the corn crop will be quite abundant. But barley and wheat crops have been very good and large. The fruit crop in Salt and Gila valleys is above average in quantity and of excellent quality. Here the July hail storm destroyed much of the fruit, yet there will be considerable of fair quality. Sheep and cattle continue in good order. Our meat markets are supplied with excellent beef and mutton, fattened on grass alone. Here and there water regarded as permanent has disappeared, yet we have not heard of a single case of suffering or death among the sheep and cattle for want of water, and stockmen are preparing to enlarge their herds by importations from California and Texas. Our season for rain will not be past for a month yet. Pima county can stand a severe drouth as well as any, and, perhaps, with less damage than any other. As to mining prospects, what is said is surely encouraging. We have some reason to believe that the Pima mining company will ere long go to crushing their millions of tons of pay ore and perhaps further develop the mine. Our latest advices from San Francisco operators with regard to the mines in the Santa Rita and surrounding mountains are all that we ought to expect. As soon as the weather cools off on the Colorado desert, we are assured that Californians interested in mines to the southward will come and give personal attention to them. While money is and may continue for some time scarce, the accumulation of valuable property is quite rapid. All in all, the future, so far as can be foretold or foreseen, is rather cheerful than otherwise.

Then the indications are that the railway will soon be extended east from Yuma from 150 to 200 miles. This will tend to the speedy improvement of the Gila valley, and attract the bulk of the shipping of the Territory to the valley. It will enable many mine owners to either ship or reduce ores at home, which cannot now be banded without loss. It is almost a business necessity for the Southern Pacific to do what Chief Engineer Gray says will be done—extend the road eastward without delay.

## The Future of Montana.

At no period in the history of this Territory have the prospects of continued and increasing prosperity been more encouraging than they are to-day. The mines are paying quite as well as in past years, and there is no reason to believe that this will not continue for some years hence. Of course the placers will not continue to be remunerative for all time to come, but it should be borne in mind by those contemplating coming to Montana to settle that she has other sources than her placer mines from which to gather wealth. Her silver quartz lodes are now in a fair way of development, there being not less than 1,000 men engaged in the extraction and reduction of this class of ores, and the ore reduced must average 150 tons. There is now good reason to believe that the number of men employed and the reduction capacity of mills, concentrators and furnaces combined will not be fully doubled before the close of the year. All developments made give unmistakable evidence that the lodes are rich and permanent, and the hullion product only governed by the capacity of the reduction works. In addition to the amount above stated as being reduced daily, several thousand tons of the richest have been shipped out of the Territory for reduction. The gold quartz mines have also been worked with unusual vigor this year. The number of men employed in extracting gold ore is estimated to be about 1,000, and nearly 400 tons are daily mined and reduced. The reduction facilities promise to be greatly increased before the close of the present season. The mines never before looked so encouraging as they do now. The copper mines are no small source of Montana's wealth. There have been many valuable lodes discovered, and several have been systematically developed. Several hundred tons of ore that contained upwards of 50% of copper have been shipped to Newark, New Jersey, for reduction. This branch of mining has been seriously retarded in consequence of the entire absence of reduction works, save one small concentrator. It is almost certain that this state of affairs will be changed soon. There is no better opening for capitalists anywhere than is here presented, if capital be used in the erection of reduction works and the development of copper lodes. —*Helena Independent.*

**PHOSPHIDE OF COPPER.**—M. Lidot has presented to the Paris Academy of Sciences a flask containing phosphide of copper so perfectly crystallized that the crystallographer would possibly be able to determine its form. M. Lidot presumes that this substance enters into the composition of certain bronzes, which thus acquire a remarkable sonority, besides becoming very hard and very brittle.

## The Precious Metals of the Land of Midian.

On the eastern coast of the Gulf of Akaha runs the ancient land of Midian, and for long years past that country has been supposed to teem with mineral wealth. The Khedive, whose viceregal rule extends to Midian, had long a desire to put rumor to the test, and asked Captain Burton to make a visit of inspection. The party, which included a secretary and an able mining engineer, M. George Marie, left Suez on the 21st of March last, and proceeded by way of Moilah to Eynounah hay, at the entrance of the Wady, or valley of Eynounah, on the eastern side of the gulf. These wadies are curious. The coast is divided from the interior by a range of granite and porphyry mountains, running about parallel with the sea; but water has worn its way as usual, and these gorges, each with its mountain torrent, occur at frequent intervals. They are barren, rocky places, with no possibility of much culture, and yet they all bear signs of abundant population in times gone by.

Large towns, built not of mud, as Arab towns so often are, but of solid masonry, such as the Romans always used, roads cut in the rock, aqueducts five miles long, remains of massive fortresses, artificial lakes—all these signs of wealth and numbers, are reported by Captain Burton. According to him, the reasons of it all is not far to seek. The rock is full of mineral wealth. Gold and silver they found, and the former seems to exist in quantity sufficient to repay the labor of acquisition. Quartz and chlorites occur with gold in them, just as they are found in the gold districts of South America. The party tested both the rock, by crushing, and the sands of the stream, by sifting, and each with good result. Tin and antimony they also discovered, and they had evidence of the existence of turquoise mines. Each ruined town had its mining works; dams for washing the sand and crushed rock were frequently seen; scorie lie about near ancient furnaces; in short, the traces are numerous of a busy mining population, in a country which seems to be full of mineral wealth. From Makna, or Mugna, the capital of the land of Midian, up to Akaha, at the head of the gulf, Captain Burton reports the country as auriferous, and he believes the district southwards as far as Gehel Hassani—a mountain well known to geographers—to possess the same character. He even goes so far as to say that he has brought back to life an ancient civilization. —*London Times.*

## Glassware.

The fine display of glassware made by the San Francisco factory, in the pavilion, is almost entirely hidden from view, and shielded from harm, by the silk exhibit. One would have supposed that such a pyramid of glass could not have been easily hidden, but such is the case. It is a creditable showing of the home manufactured article, and comprises a full stock of the common kinds of green and dark ware. Among the many different articles they display, we notice a huge champagne bottle holding 100 pints; carboys of unknown capacity, glass globes, for ornament, fruit jars of four kinds, soda and other small bottles, demijohns of the most approved kind, which, as every one knows, are Newman's covered ones, which can't be broken by fair usage. This most ingenious contrivance has in a great measure revolutionized the retail trade in liquors. Formerly five gallon kegs were resorted to when sending small amounts of liquors or chemicals into the country. Now Newman's patent tulle covered and boxed demijohn is almost entirely used for this purpose. They are first covered with tulle grass, over which is plaited the usual wicker covering, and then for country travel put in a box with screw top, so that they go safely over the roughest road, and return again to be filled any number of times. The San Francisco Glass Works Company is a combination of two former companies, and their works are situated near Fourth and Townsend streets, and are well worth a visit.

Immediately adjoining the above exhibit is that of John Taylor & Co., druggists' glassware and fittings. They show a fine assortment of such goods, including gold scales of the most approved pattern, retorts, hullion moulds, assayer's furnaces, fancy glassware, carboys of different shapes, porcelain ware for different uses, the whole surmounted by a statue of Atlas sustaining upon his shoulders a large glass globe. At the end of the fair we presume the old fellow, with all the goods now in his charge, will retire to some easier job, at Nos. 512 and 514 Washington street, where Messrs. Taylor & Co. hold forth.

**AWARD OF THE LAVOISIER MEDAL.**—The Lavoisier medal of the Societe d'Encouragement pour l'Industrie Nationale has just been given to an Englishman, Mr. Walter Weldon, F.R.S.E. In presenting it, M. Dumas congratulated Mr. Weldon upon having cheapened every sheet of paper and every yard of calico made in the world; and at the same meeting at which the presentation took place Prof. Lamy stated that, whereas at the date of the introduction of Mr. Weldon's invention, seven or eight years ago, the total bleaching powder made in the world was only about 55,000 tons per annum, it is now over 150,000 tons per annum; and that of this vast quantity fully 90% is made by the Weldon process.

## Hunter District.

The new district discovered not long since north of the railroad, in Eureka county, Nev., is looking well. The town of Carlin has just started a journal, called the *Carlin Pioneer*, in the first issue of which we find the following regarding Hunter district. This district is situated about 12 miles nearly north west of Carlin. It has been but recently discovered, and is rich and extensive the mines will prove to be is still a matter of conjecture. The statement of developments, which we give below, gives a fine promise, and we earnestly wish that the brightest hopes of the owners may be realized. No class of persons deserve more of the sympathies of mankind than the prospector. In this, the richest of quartz-mining regions, one out of 50, perhaps, is successful; the other 49 pass away in time, unhonored and unknown. Yet the prosperity of the country is the product of these self-sacrificing, unyielding prospectors, who are too poor to be independent and too proud to be menial.

Carlin has another show for life and prosperity in Hunter district. Let her see to it that the mines be not allowed to fall for want of a little help to the prospector. The indications are, however, that the mines are now, or soon will be, beyond the need of assistance. The following is a brief statement of the present condition of some of the most promising locations. The Broad Horn is the name given to the discovery location. A shaft has been sunk to the depth of 30 feet, showing a vein 18 inches wide, the average assay being \$100 per ton. Three other locations have been made upon the same lead, which can be traced by croppings the entire distance. The general direction of the leads of the district is north and south. The Short Horn lead lies north of the discovery. In the shaft, 12 feet deep, the quartz is from two to three feet wide, and assays from \$90 to \$300. The Derby lead is south of the discovery; it shows a larger vein than either of the other locations. The owners of these claims are J. Gilligan, C. Staffenburg, D. Washeim, H. Deacon, J. McClure, J. E. G. Hunter, T. Veats, C. Rockhart, C. Crumpecker, J. Hollister, A. Bruce, T. Holmes, E. Cousins and L. G. Smith. We have been unable to get the particulars of the fourth location, but understand that the indications are fully as encouraging as upon either of the others. Two locations, the Oriental and Atlantic, have been made upon a vein parallel to that above described. The Oriental yielded three tons of \$60 rock from a shaft eight feet deep. The owners are T. Holmes, D. Washeim, C. Washeim, J. Gilligan and C. Staffenburg. As indicated by the number of owners, some small sales have been made; one, upon the Short Horn, for \$6 per foot. We understand that the owners of the Broad Horn have let a contract to sink 25 feet more. This will make their shaft 55 feet deep.

## The Prospector.

Yesterday, we saw on Main street a specimen of the old-time prospector. These restless pioneers are seldom to be seen in the old mining camps nowadays, but are usually found upon the verge of civilization, pushing outward to unprospected fields, in search of that fortune which they feel certain is in store for them, but which almost always eludes them. In the early days of California mining, prospectors would make their annual migrations from the northern to the southern mines, or *vice versa*; or, after spending the winter in working the ravines and flats, would seek the rivers in the summer, to turn the stream in order to work the deposits, which too often were more illusory than real in value. The prospector of the olden time usually had a little burro, upon which was loaded the blankets, camp and mining utensils, and provisions, while the prospector would follow on "Shank's mare," carrying rifle or revolver, and was always cheery and hopeful, because he was young and full of animal spirits, and the virgin soil had untold wealth waiting the labor and search of the gold seeker. There is a fascination in prospecting for deposits or leads containing the precious metals that the uninitiated cannot realize; and with some men it becomes the passion of their lives. They have no home or abiding place—they desire none. The good find of to-day will pall upon their senses on to-morrow. There is something better beyond, and they go in its search—and thus they continue to move on, until age, decrepitude, disease and death may overtake them; but within them hope is ever young. But to come back to our item: Our old friend, yesterday, did not look as if he had found the golden fleece. His step had lost the elasticity of youth; his hair and whiskers were turning gray in the shadow of declining years, but the bronzed cheek and strong muscles told of an out-door life of labor, and the independent air of his movements proclaimed him one of the pioneers. He had the usual prospector's outfit—roll of blankets, pick, shovel and pan, but they were not strapped on the back of a "Washoe Canary"—grass was too short with the old man for that—but he had them loaded on a light wheelbarrow, which was an easy-going vehicle, and not liable to streaks of stubbornness or frights from the strange sights or sounds of civilization. The old man passed down Main street and on beyond. He is looking for the rich lead which has escaped him since the "days of '49."—*Grass Valley Union*.

## Useful Information.

## What a Gas Manufacturer Ought to Read.

At the last meeting of the British Association of Gas Manufacturers, the President, Robert Paulson Spence, in his annual address, spoke as follows: "I cannot shrink from the expression of my opinion that a gas manager should aspire to a scientific knowledge of the material structure of the globe, its place and its path in the universe, and attain to such a degree of familiarity with the sciences of chemistry, geology and astronomy as may enable him to bring to the practical and every-day labors of his life the aid of those great principles which are involved in, and underlie, the solution of the problems which naturally arise, and require his skill in the determination of the right direction to be given in his dealings with the various forces of nature, intimately connected, as they undoubtedly are, with his common avocations, demanding the economical adaptation of the means to the end to be accomplished."

And these being the primary objects of his professional life, I would suggest that he would do well to have on his book-shelves Kingley's "Town Geology," an elementary and popular work, treating of the soil of the field, the pebbles in the street, the stones in the wall, the coal in the fire, the lime in the mortar, and the slates on the roof; the works of Hugh Miller, entitled "My Schools and Schoolmasters," "The Testimony of the Rocks," and the "Old Red Sandstone;" Faraday's popular lectures "On the Various Forces of Nature," and the "Chemical History of a Candle;" Notes of a Course of Nine Lectures on Light," delivered at the Royal Institute in 1829; and "Six Lectures on Light," delivered in America, in 1872-3, by Tyndall; and Herschel's "Outlines of Astronomy."

These several works contain almost inexhaustible and measureless mines of intellectual wealth, calculated to raise the conceptions, expand the intellect, and enlarge the resources of the gas manager, place him above the common level of his fellow-townsmen, and make his power felt by them, to a degree and in a way in which it could not otherwise be, quite as much to their advantage as his; and thus it would, in his own experience, prove the truth of Lord Bacon's aphorism, that "knowledge is power," always assuming that the knowledge is accompanied by the twin virtues, discretion and courtesy. The chemist, the geologist and the astronomer each furnish all-important aids to the gas manufacturer and manager, enabling him to trace effects to causes, and to make the best use of materials.

**DELICATE MACHINERY.**—The mechanical machinery at the Bank of England, says the *British Trade Journal*, is marvelously perfect. It may not be generally known that the London bankers, when the standard weight of the working sovereigns is suspected, send these into the Bank of England, the suspected coins being kept separate and weighed one by one, and the light sovereigns charged to the debit of the banking house that delivered them. To large concerns like Glyn's, the London and Westminster, Barclay's, and the National Provincial, the debit account for light gold foots up at the end of the year to a large amount. The deficiency in the weight is caused by abrasion in the constant wear and rubbing of the gold currency. The machines which weigh the sovereigns are numerous, about 12 or 14. They are driven by an air engine, and are fed through long tubes placed in an inclined position over the machines, and one by one these clever machines weigh them, and like stern sentinels pass the honest sovereigns to the right hand, but without ceremony, kick the light one, which is found wanting, into another basket. These machines are beautiful. Their perfect automatic action excites admiration. The sovereigns which pass this infallible and equally inflexible judge are put into bags and have the honor of again asserting their honest value in the busy world. With regard to those which have been placed in this beautiful balance and found wanting, they are cut to pieces and afterwards cast into a burning fiery furnace at the Mint, and there regenerated in full weight and measure, made bright and beautiful, and impressed with the image of Queen Victoria.

**SAWDUST SOAP.**—A manufacturer in Tilist, instead of adding infusorial earth or ground quartz to the soap mass and thus producing a sapollo, introduces a considerable quantity of very fine sawdust, previously ground and sifted. The wood fiber acts mechanically as a detergent, and besides cleaning rapidly and thoroughly, occasions a saving of one-third in the consumption of soap. The soap does not contain an excess of soda, and has no ill effect on the hands. An analysis of a specimen eight days old yielded—grease, 44%; soda, 6%; wood, glycerine, coloring matter, 10%; water, 40%. The price at the factory is about five cents per pound.

**PRESERVATION OF LIME JUICE.**—Lime or lemon juice may be preserved as follows: Heat the juice, to coagulate albuminous matters, and then sweeten with pure glycerine. The glycerine will not only retard turgid growths, but prevent the juice from freezing even during the coldest winters.

**IMPERVIOUS MATERIAL FOR DRY METERS.**—A want long felt, as in the construction of dry meters, etc., of a good elastic material, impervious to water and to burning gas, and at the same time unaffected by hydrocarbons condensing from the gas, or impurities in it, has been met, according to Dr. Tieftrunk, by an article recently produced by Engineer Schilke, which will doubtless meet with many applications. Dry meters, in which it has been employed, have been noticeably affected by use for half a year. Dry pressure regulators made with it have also been found very superior to the wet ones generally in use, and Dr. Tieftrunk states that by means of them he can regulate the temperature of an air or oil bath so that the highest variation would not exceed 2°. The article consists of woven material, impregnated with a substance that precipitates in the pores, and which combines a high degree of elasticity with the requisite strength, and is not rendered sticky, and does not lose its imperviousness or elasticity under the influence of the hydrocarbons present in burning gas. A sample was not impaired in any of these particulars by an immersion of three days, at a constant temperature of 104° in hydrocarbons extracted from gas by cooling it at 4° below zero. The same was true after digestion with a solution of carbonate of ammonia, and with bisulphide of carbon.

**HOW A SILK-WORM MOTH GETS OUT.**—It has usually been supposed that all the silk-worm moths issue from the cocoon by moistening the threads and pushing through them. This is, however, not the case with *A. luna*, a large, handsome, pale-green moth, with long "tails" on its hind wings. Our attention was called to a rattling, cutting, or tearing noise, issuing from a cocoon of this moth. On looking at the cocoon, a sharp, black point was seen moving to and fro, and then another, until both points had cut a slit, through which the shoulders of the moth could be seen. The hole is made in a minute or two, and the moth works its way at once out of the slit. The wings at this time being very small and flabby, the points stick out, and can be used for the purpose indicated. In half an hour after exclusion from the cocoon the wings become fully expanded; but the black points can still be seen through the hairs immediately at the base of the wings. In this case no fluid was seen to exude from the moth and the cocoon was perfectly dry.

**ROMANIAN AMBER.**—According to H. Biziste, of Bucharest, says the *American Builder*, Romanian amber differs totally from the German amber found on the shores of the Baltic sea. Both are the fossil resins of anieliniferous trees and agree in chemical composition but differ in color. German amber is found only of light colors—yellow, white and pink—while Romanian amber is red, pink, brown, blue, green and black. These colors are frequently found mixed in a single piece, and we also have lumps with silver-colored veins and gold specks. On account of this variety of colors, the Romanian amber is highly esteemed, and the darker and more beautiful pieces are more costly than yellow amber, especially as they are far more rare.

**AN AMERICAN SUBSTITUTE FOR GUM-ARABIC.**—It is said that the mesquite gum of Western Texas is almost identical with gum-arabic, and, during the past year, has become an article of export, some twelve thousand pounds having been gathered in Bexar county, and as much more between that and the coast. This gum exudes from the stem and branches of the mesquite, a mimosa, several species of which grow in Texas, New Mexico and Arizona.—*Journal of Microscopy*.

**GRAVITY OF WOODS.**—The woods which are heavier than water are Dutch box, Indian cedar, ebony, lignum-vite, mahogany, heart of oak, pomegranate, vine. Lignum-vite is one-third heavier, pomegranate rather more. On the other hand, cork, having a specific gravity of .24, and poplar, .383, are the lightest woody products.

## GOOD HEALTH.

## To Lower the Temperature in a Sick Room.

Dr. Henry N. Dodge, of Morristown, gives the following to the *Scientific American* as the result of his experience: A few weeks ago, while thinking with some anxiety of the dangers which the approaching hot weather might bring to his teaching child, the idea occurred to the writer that the temperature of a heated room might be lowered by keeping the window awnings saturated with water or any volatile fluid.

By this means not only would the air which entered the windows be cooled by contact with the cool wet surface of the canvas, but also by evaporation of the moisture from the awnings. Accordingly, on the following day, a brass tube having a diameter of one-quarter of an inch was so placed that it would lie across the outside surface of the awning at a distance of a few inches from the upper edge, which is attached by books and rings to the house. The ends of the tube, being bent at right angles to the tube, hung down by the sides of the awning about six inches. All along the side of the tube which touched the awning were drilled, at intervals of three inches, holes about the size of a pin. One end of the brass tube was closed and over the other end was slipped a small indiarubber tube. This tube was carried in at the open window and con-

ducted by an ordinary screw coupling to the nearest cold water faucet. The awnings of three windows of the nursery having been supplied with this simple apparatus, the water was turned on, and, after passing through the rubber tubing, escaped through the perforations in the metal tubes, and, flowing evenly over the front and sides of the awnings, dripped upon the tin roof of the porch below the windows—a miniature summer shower. In a short time a refreshing coolness and moisture of the atmosphere remained on the breezes blowing into the windows from off the surface of a lake. A thermometer hung outside of the window under the awning, while still dry, showed a temperature of 97° F. Upon turning the water on, the mercury sunk in 15 minutes to 90° F., the thermometer still hanging below the awning, but protected from contact with the water. A still more marked effect might be produced by passing the rubber tube through a coil of broken ice. The apparatus is inexpensive; the amount of water used is small, while the comfort which it might bring to a sick child or a feeble invalid might be very great. The apparatus does not interfere with the rising or lowering of the awning; and should the dripping be objectionable where there is no roof below to receive it, a small gutter of canvas or metal could be readily attached to the lower edge of the awning to carry off the water; or a small flow of water may be used, enough only to keep the canvas moist.

## Vulcanized Rubber Not Poisonous.

Those of our readers who have "shuddered" lest they were pressing poison to their lips in the red rubber plate in which their "toughened" teeth were set, may reassure themselves. The subject has been taken up and thoroughly investigated by scientific men, and in the *Chemical News* we read the review of the case and the verdict of acquittal.

An impression has long prevailed that it was possible for the salts of mercury, used to color red vulcanite, to exert a poisonous influence where red rubber plates were worn in the mouth; and the attention of the Odontological Society having been strongly drawn to the subject by Dr. Bistaurst, Woodman's papers, relating cases of supposed mercurial poisoning from this cause, a committee was appointed to collect evidence and report upon the subject. Their inquiries have, however, utterly failed to establish the existence of a single case of unquestionable, or even probable, mercurial poisoning due to the use of red vulcanite plates. The committee requested Prof. Arndt to make "an investigation of the influence, if any, of saliva and the other fluids of the human body on the pink and red varieties of vulcanite used by dentists in making artificial teeth-plates, gums and palates." These tinted varieties of vulcanite are made by heating pink or red "dental rubber," under pressure, to a temperature of 310° to 315° F. (154° to 157° C.), the "dental rubber" being prepared by incorporating sulphur and vermilion with pure indiarubber. The following are the results of Dr. Arndt's investigation: 1. So far as any action on man is concerned, vermilion is a harmless substance. 2. So far as any effort or influence of the vermilion is concerned, the mixture of vermilion, sulphur and indiarubber, commonly termed "dental rubber," is also a perfectly innocuous substance. 3. Pink or red dental vulcanite, even when placed under the severest conditions of experiment, does not yield any trace of mercury to saliva, or, indeed, to other far more powerful solvents. 4. The metallic pins and braces in dental vulcanite do not displace mercury, or induce the formation of any compound of mercury soluble in saliva or in more powerful solvents. Dr. Arndt is therefore of the opinion that vermilion vulcanite teeth-plates are practically unaffected by saliva, or by any substance which ever gains access to the mouth; and, in short, that the pink and red vulcanite artificial gums and palates now so generally worn are absolutely harmless.

**DIARRHOEA IN HOT COUNTRIES.**—In *New Remedies*, Dr. Talmay prescribes for the diarrhoea of hot countries, from 20 to 300 grams of lactose, or sugar of milk, daily. He administers it in the simplest way—the sugar, dissolved in a little water, or as a draught in the course of the day. An excellent mode of administration consists in putting the dose of milk to be taken into half a liter or two liters of milk, according to the habits and the digestive capacities of the patient. The treatment is spread over several months, diminishing the dose as nutrition becomes more considerable and easier. According to M. Talmay's little work (published by Cocoon, Paris), the endemic diarrhoea of hot climate is the result of a functional lesion of the liver, which results in the diminution and even the suppression of the glycogenic function of the liver. The sugar of milk may thus replace the glucose which is wanting in the blood.

**SALICINE FOR CHILLS.**—Dr. Thompson reports, in *British Medical Journal*, a number of cases showing the superior efficacy of salicine in the treatment of intermittents. Cases wherein quinine had utterly failed were promptly relieved with this agent. He used large doses, grs. xxx every two hours. Usually the fourth dose was sufficient to break up the chain of morbid action, after which a few doses at longer intervals completed the cure. It may be given when the chill is on, and will usually shorten the chill, and greatly mitigate or even arrest the febrile exacerbation.

#### TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—Another Industrial Enterprise; Items of Interest from the Mines; Kustel & Hoffman's Amalgamator; Bullion Shipments; New Idria; Sutor Tunnel, 145. The Week; Use of Mining Terms; Utilization of Home Products and Labor; Mining Accidents, 152. Corrugated Glass Reflectors; Richards' Improved Buddle, 153. Construction of the United States Mining Stations, 153-56-57. Patents and Inventions, 157.

**ILLUSTRATIONS.**—Kustel & Hoffman's Improved Amalgamator, 145. Richards' Improved Buddle; Boehm's Corrugated Glass Reflector, 153.

**MECHANICAL PROGRESS.**—A Screw Ventilator; Australia and America; Bronze for Valves and Cock; Prizes for Alloys; Cleaning Iron Wire; On Files; American Tools; Agricultural Implements in Russia; A Noise Extinguisher; Pneumatic Hoist; Train Telegraph; Novel Plate Work, 146.

**SCIENTIFIC PROGRESS.**—Moons for Mars; Missing Islands; Venus's Slippers; Astronomical Work in Washington; Nordenskjöld's Next Expedition; Spectrum of Electric Light, 147.

**MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 148.

**MINING SUMMARY** from the various countries of California, Nevada, Arizona, and Montana, 149-156.  
**USEFUL INFORMATION.**—What a Gas Manufacturer Ought to Read; Delicate Machinery; Sawdust Soap; Preservation of Lime Juice; Impervious Material for Dry Motors; How a Silk-worm Moth Gets Out; Roumanian Amber; An American Substitute for Gum-Arabic; Gravity of Woods, 151.

**GOOD HEALTH.**—To Lower the Temperature in a Sick Room; Vulcanized Rubber Not Poisonous; Diarrhea in Hot Countries; Salicine for Chills, 151.  
**GENERAL NEWS ITEMS** on page 157 and other pages.

**MYSTELLANEOUS.**—A Reception to Distinguished Scientists; Mining in Butte County; A New Concentrating Mill, 146. Idaho Mines; Artificial Gems; Prospects in Arizona; The Future of Montana; The Precious Metals of the Land of Midian; Glassware; Award of the Lavoisier Medal, 150. Hunter District; The Prospector, 151. Improved Mining Machinery; The Welland Canal; A New Utah Concentrator; French Railway System; Wagon Materials; Marine Sounding Line; Eugenic Plant.

#### The Week.

The absorbing topic of the week has been the election, and both city and country have been in a state of excitement concerning it. Election day passed off quietly everywhere, however, and as we write (Thursday) those interested are in a state of expectation as to the result. We are glad it is all over, and our interior exchanges will have more time to give to local interests outside of politics, that subject having been an absorbing one for some time past. The principal item of interest in connection with mining matters is the decision of the United States Supreme Court in the matter of the bullion tax in Nevada, given on an appeal from the Circuit Court of that State. It was held by the appellant that the State had no right to enforce the tax as the title to the land from which the mineral was taken still rested in the United States. The Supreme Court decides that this point is not well taken; that, as the claim may be sold, transferred, mortgaged or inherited, without infringing the title of the United States, it may also be subjected to a lien for taxes; and the claim, such as it is, recognized by the statute, may be sold to enforce the lien. It is therefore decided that the law is valid. Want of space in this issue prevents us giving the full text of the decision, which we defer until next week.

The extension of Voelters's wood pulp reducing patent disappoints the expectations of a fall of two cents per pound on printing paper, which was expected to result soon from the expiration of this patent.

DAMAGE to the amount of \$3,000 resulted from a boiler explosion at Beucica, Friday afternoon.

#### The Use of Mining Terms.

The decision in the case of the Eureka Consolidated mining company vs. the Richmond Consolidated company (limited), was given in favor of the Eureka company on the 22d ult., at which time we gave a synopsis of it. We give elsewhere in this issue the decision in full, having, until now, been unable to obtain an official copy. The case has attracted a great deal of attention in mining circles, and the decision is a decidedly important one to the mining community, involving, as it does, not only such an amount of money, but an important construction of the United States mining laws. In one respect it reminds of us a remarkable trial which took place in Edinburgh in 1853, before the Lord Justice-General and a special jury, to try the question—what is "coal." The owner of an estate had granted a lease of the whole coal contained in it. In the course of working the lessees extracted a combustible mineral of great value as a source of coal gas, and they realized a large profit by selling it as gas coal. The lessor denied that the mineral in question was coal, and disputed the right of the lessees to work it. At the trial there was a great array of scientific men, including chemists, hotsuists, geologists, microscopists, practical gas engineers, coal viewers, and others. On the one side it was maintained that the mineral was coal, and on the other that it was a bituminous schist. The evidence, as might be supposed, was conflicting. The judge accordingly ignored the scientific testimony altogether, and summed up as follows: "The question for you to consider is not one of motives, but what is this mineral? Was it coal in the language of those persons who deal and treat with that matter, and in the ordinary language of Scotland? Because, to find a scientific definition of coal, after what has been brought to light during this trial, is out of the question. But was it coal in the common use of that word—as it must be understood to be used in language that does not profess to be the purest science, but in the ordinary acceptance of business transactions reduced to writing? Was it coal in that sense? That is the question for you to solve." The jury found that it was coal.

The judges in the Eureka case appear to have acted in the same way, and ignored for the most part all the scientific evidence, taking a common sense view of the matter. The array of experts at the trial was formidable, and to the assertions of some of them the same word might be applied. When half a dozen experts are employed on one side, and half a dozen on the other, in any case, there is apt to be some considerable difference of opinion; and more especially when some of them have derived their knowledge from books and some from practice. Had time and space permitted, we should have liked now to have quoted largely from the evidence given, but in this instance confine ourselves to a few remarks upon the use of certain mining terms in connection with it.

Lode is a very old term. In Price's "Treatise on Minerals, Mines and Mining," containing the theory and history of strata, fissures, lodes, etc., to which is added an explanation of the terms and idioms of miners, published in London, in 1778, the definition is as follows: Lode (main-rake, N. England). The word lode is an old Anglo-Saxon word; same as lead; so lode-stone as lead-stone (see Lye's edition of Junius); any regular vein or course, either metallic or not; but more commonly it means a metallic vein; and being occupied and proving good, may be indifferently called a lode, vein, or work." It will be seen by this that the word was old even a hundred years ago. The generally accepted meaning of the word by miners has a very narrow signification. It means a large-sized metalliferous vein, with well defined hanging and foot walls. On the other hand, "ledge," which we think is a California term, has such a broad signification that we can hardly tell what it means. So that, in locating a mining claim, if the posted notice claims a ledge or lode with 200 feet on each side of it, they mean all the minerals within the 400 feet wide for the length of the claim at surface, and to follow them down wherever they go. According to this decision, hereafter miners may know that when they locate claims upon an ore channel, whether the ore is found in a continuous fissure or a succession of deposits, the claim will be held as a "lode."

We cannot understand why the scientific experts engaged in the trial should call the metalliferous limestone bed a zone. We have looked over all the English works on geology which we have by us, and cannot find a precedent for the use of the word "zone" in this connection. In geography, zoology and botany, it is common enough, but we are not familiar with it in reference to mining matters.

In regard to the use of the words "dip" and "underlie," a few words may be said. The normal portion of a bed is horizontal; so the measurement of its "dip" or deviation from this normal position is naturally and necessarily made from the plane of the horizon. In metallic veins, another term conveying a different idea is commonly used, and the inclination of the lode is spoken of as its "underlie." The real meaning of the word underlie, as applied by miners to a lode, is employed to express its deviations from a vertical plane. (The normal positions of veins, conversely to that of leads, is

vertical). As a simple matter of definition, the "underlie" of a vein must be considered as the complement of its "dip," as the angle which the plane of the vein makes with a vertical plane following its strike or bearing; and as a matter of practice, the inclination of metalliferous veins is most usually and commonly expressed in this manner.

In stratified rocks it would hardly be correct to call the underlying or overlying rocks of a bed of limestone the foot wall or hanging wall.

With regard to the word "bed," Page's definition is, "a term usually applied both by geologists and quarrymen to a stratum of considerable thickness and of uniform homogenous texture, as a 'bed of sandstone,' 'bed of clay,' etc. Originally and strictly, however, the term 'bed' referred to the surface junction of two different strata, and 'seams' to the line of separation between them. Thus the upper surface of a stratum may be smooth, or it may be rough and irregular, and the under surface of the stratum deposited on it must partake of this smoothness or this irregularity—this is bedding. The line that marks the separation between two strata is a 'seam.'"

On the whole, the decision seems to have been favorably received. The gist of the whole thing is in the following words: "Our opinion, therefore, is, that both the defendant and plaintiff, by virtue of their respective patents, whether issued upon locations under the Act of 1866 or under the Act of 1872, could only follow the veins or lodes lying within lines drawn vertically downward at the end of their respective locations, and that each took the ores found in all veins or lodes, the apex or top of which lay within those lines." That is, a mining company cannot extend their work one inch beyond their end lines, but may follow any deposit of ore found within their lines to any distance beyond their cross lines.

#### Utilization of Home Products and Labor.

Unquestionably the best channel into which much of the idle capital on this coast could be put, is in founding and upholding home industry and encouraging the employment of home labor. The Pacific coast will never be thoroughly prosperous until this fact is acknowledged and until it is more generally practiced. The great difficulty our manufacturers here have to contend with is competition with eastern factories, and the fact that the merchants or importers, an influential class of the community, are decidedly opposed to assisting home industries in any way, when there is any danger of the products interfering with the sale of the imported article. The people themselves, on whom manufacturers must depend for the sale of goods, naturally buy where they can buy cheapest, provided the article suits them, so that manufacturers here in any branch must make their products both good and cheap to insure sale.

Another feature, and an important one to be considered in connection with home industries, is that the more of such institutions there are the more field there is for labor, and the better chance there is for the youth to learn trades by which they can support themselves. Again, the establishment of any new factory here tends to the utilization of home products in the shape of raw material of different kinds, so that its influence on our labor market is more widespread than a casual observer would imagine; as the collection and preparation of raw material of any kind furnishes employment to one class of labor, as its manufacture furnishes work for another class. Any man, therefore, who establishes and maintains a home industry which carries out these principles, is of more value to the community than a dozen middle-men, who simply stand between a producer in one part of the country and a purchaser in another part, demanding the profit of one and increasing the expense of another.

Probably as good an illustration of the truth of these remarks as could be found, is shown in the manufacture of furniture. The business is carried on in this city by a number of large firms, and they manufacture furniture in every variety of style and price. A great deal of this class of goods is also imported, more particularly chairs, which latter are sold here as cheap as where they are made.

In one of these factories in particular—that of the West Coast Furniture Company—are many illustrations of the ideas advanced in preceding paragraphs of this article. Here is a large establishment making quantities of furniture of all kinds from original designs, utilizing Pacific coast woods, employing skilled labor, and opening up new branches of trade which give employment and instruction combined to numerous boys and girls. The experiment in its inception was a hazardous one, a large amount of capital being involved, and very little being known of the properties of the Pacific coast woods, beyond the fact that most of them were of unique appearance when finished. Moreover, skilled workmen in this line were rare, and the market already crowded with imported goods.

By good judgment and management, however, and an earnest desire on the part of those in charge to establish a home industry creditable to all concerned, and of benefit to the community, the enterprise has been made self-sustaining and profitable. It now gives employment to about 300 of skilled workmen and boys and girls, the latter learning trades while at the

same time they are earning their living. This last feature is a pleasant one to contemplate, and one which reflects great credit on the superintendent and manager, Mr. McAllister. In a casual walk through the establishment the other day, we saw in each of the different department ten or a dozen boys or girls engaged in various kinds of labor, some of them appearing quite skillful, and all seeming contented with the work assigned to them. They all do piece work, so that the amount they earn varies with the industry and skill of the individual. In the basket making department we questioned a girl of about 15, who was making basket bottoms, as to her earnings, and found them to be from 90 cents to a dollar a day. A daily cotemporary has done the factory an injustice in a recent statement, to the effect that the girls making fancy chair bottoms only made about \$1 a week. The statement is very wide of the mark, to say the least. Those with whom we conversed seemed content with their wages and their work. Boys are employed in making baskets, mattresses, in varnishing and renovating, and in the joiners' department. In the latter department the boys are taken on a probation of three months, with no wages. If they show an inclination to be steady and learn the business they are given piece work at the end of that time, and their earnings then depend on individual effort. Some of them turn out quite creditable pieces of work, evidencing considerable skill. In each of these departments a skilled workman superintends the boys or girls, and other skilled workmen are also employed. Mr. McAllister says his men are as good a set of workmen as he would wish for, and he has never had the slightest trouble with them on the question of employment of boys and girls. No Chinamen are engaged in any of the work at all.

The basket making department in this institution has not been in operation very long, but it is one of great usefulness in many ways. The baskets are made of wood and rattan, tan bark, oak and sycamore being the principal woods. This utilizes a wood heretofore neglected in manufacturing branches. The oaks are stripped of their bark and then left to rot on the ground, but the utilization of this refuse wood in basket making gives a use for it not thought of before. In this line, moreover, an opportunity is given for boys and girls to earn a livelihood at light work in an entirely new industry inaugurated at this establishment.

There is a comparatively small market here for furniture, as California wooden products cannot stand shipment across the mountains on account of expense, and then come in direct competition with Eastern goods. It behooves all good citizens, therefore, to encourage as much as possible home industries of this sort, which utilize home products and give employment to those who need it. There is nothing at all lost in this, and a great deal gained in every way.

**MINING ACCIDENT.**—On Tuesday last the cage at the Savage mine, in which there were two men, was run up into the shafts, and one of them, John Moyle was wounded in a fatal manner, dying the same night. The accident occurred at the time when the engineers were changing shifts. Mr. Mitchell, who had the engine when the accident happened, had just come to take his shift. The finger of the dial, by means of which the rising and lowering of the cage is regulated, makes about one revolution and a half while the cage is passing the length of the shaft. When Mitchell took the engine the finger of the dial was at the same point where it would have been had the cage been at the hoh pit, some forty feet from the bottom of the shaft; while on the contrary it was at a point near the top of the shaft, having ascended till the finger of the dial had made one revolution. Thus, looking at the dial and not observing the amount of rope on the reel, he turned on a full head of steam and the cage was out of the top of the shaft and almost up into the shafts before he saw that anything was wrong. All occurred in such a short space of time that it was impossible to stop the cage after it was seen that it was going into the shafts.

**WORK IN THE UNIVERSITY LABORATORIES.**—We learn from an article in the Oakland Transcript, that Prof. Hilgard has his hands full in his laboratory. Farmers from all parts of the State are calling upon him for information concerning the material with which they are dealing, and thus they will be able to do more direct and more effective work in many cases, where the key to the affairs lies in a scientific examination. We read that the Professor now has under analysis samples of California sumac, from Orange, Los Angeles, and from San Diego. He has several samples of sugar beets from different parts of the State. He has contributions of soil from Santa Rosa, Tomales, Stockton and other places, which he analyzes and determines the best fertilizer to be used and what quantity is needed. Also alkali soils from San Jose, for which he is to find something that will make it productive. He has sea weeds from Pescadero and along the coast, which he will burn, analyze the ashes, and find whether it can be used as a fertilizer, and on what soils. Thus a great amount of now useless growth on our sea coast can be utilized. Quite recently Mr. Sutton, Prof. Hilgard's assistant, made some analysis of the various cream tartars and other domestic powders, and found many and gross adulterations, the reports of which will be published in due time.

## Corrugated Glass Reflectors.

Mr. Emile Boesch, dealer and manufacturer of lamps, lanterns, reflectors, etc., whose factory is at 569 Mission street, is also an inventor of no small pretensions. Mr. Boesch has built up a very fine business in his line, and in making articles to suit special requirements, has called his inventive faculties into play to good advantage. This is more particularly shown in the line of reflectors. Boesch's patent silvered corrugated glass reflectors for halls, show windows, etc., of various styles and patterns are sold and put in place by all the prominent gas fixture dealers in the city. An engraving of one of them is shown herewith.

It will be seen by this cut, that each glass section rests upon a small flange around its entire edge, so that in case it should be broken accidentally, the pieces will not fall out, and it will only be necessary to remove one of the metallic back sections in order to replace a duplicate of glass; and this can be done by any person by simply bending the copper tabs which hold them steady in their place. A large space is left between the glass and the metal section, and as both the lower and upper rim are perforated, the air can circulate freely between the two, and as it becomes heated, it will rise and pass out the apertures on the upper rim, while cool air entering through the lower rim, it will effectually prevent the glass from over-heating. The draft or upward current, which is created by the circulation around the upper rim, also improves the quality of the light, and makes it steady, as it creates an upward air current from the inside of the reflector. This space also protects the silvering of the glass from damage, as metal, when in close contact with glass is apt to sweat and rust, injure the silvering of the glass, and destroy its reflecting quality. The perforated rims or borders make it an ornamented reflector, which, when adorned with glass prisms, becomes an elegant, cheap, prismatic chandelier. This is a great improvement over the old fashioned metallic reflectors, and the merits of the new style have brought it into extended use.

He makes a very fine exhibit of his lamps of several different kinds, near the northwest corner of the pavilion, and they are worthy of careful examination. Last evening we happened by them as he turned up the light in his mining lamp, and were almost blinded by the flood of light that blazed forth from the patent reflector. We never saw its equal. For ships, locomotive and mining lamps, they are everything he claims for them, and are absolutely necessary for safety, in our opinion, for such uses, and had much better be employed for carriages than many now in use.

## Richards' Improved Buddle.

Mr. Joseph Richards, of Battle Mountain, Nevada, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved automatic buddle, of which, having been practically applied and being now in use, our readers will be interested in a description. We have prepared a plain engraving, which will give a better understanding of the device. The improvement consists in a novel arrangement for automatically discharging the pulp upon the inclined surface of the buddle, and at the same time delivering upon the inclined surface, by the same automatic arrangement, any number of moving uniformly directed jets or streams of water for washing the ore and carrying away the light portions.

The bottom of the circular pan, A, is inclined or convex. In the center of the pan is a circular, raised portion, B, the surface of which is inclined or descending from its center to its outer edge. A timber, C, extends across above the center of the pan, and is supported by uprights. A vertical shaft steps in the center of the raised portion of the pan, while its upper end is secured in a suitable bearing in the cross timber. An upright cylinder surrounds the shaft, E, and is permanently secured to it, so that it will not rotate with the shaft.

Outside the cylinder, F, another cylinder, H, of larger diameter, but which is shorter than the other cylinder, is secured, so that both cylinders will rotate with the shaft, E.

Hollow arms, I, extend outward horizontally from the inside cylinder, F. These arms pass through the outside cylinder, H, and extend to the center rim of the pan, A, and are slightly curved in one direction. Short hollow arms, J, project horizontally from the outside cylinder, and extend out to the outer rim of the raised portion, B. The outer ends of the tubular arms, I, are closed, and a small hole is made on one side of the arms, above the outer rim of the raised portion, B, while a number of small holes are made along one side of the arms, above the inclosed surface of the pan, outside of the raised portion.

It will now be perceived that this combination of upright shaft and radiating arms form a compound Barker's mill, which will be rotated by the reaction of the water which escapes from the holes in the arms. In practice the pulp is delivered by a sluice trough, or other means, into the upper end of the outside cylinder, H, while clear water is delivered by a

suitable spout into the inner cylinder, F. The water will then fill the arms and be delivered in a line of small streams through the holes upon the inclined surface of the pan. The reaction of this escaping water will cause the entire device to rotate in a direction opposite to that in which the streams are projected. At the same time the pulp is discharged through the holes in the arms, I, upon the outer edge, or near it, of the raised platform, B, and flows down along the inclined bottom of the pan, where it is acted upon by the small jets or streams of water by which it is washed, and the lighter portion separated.

This arrangement of the water jets forms what Mr. Richards calls a hydraulic brush, which is automatically caused to sweep over the surface of the pan on which the pulp is spread, and by its gentle washing action separates the particles and carries off the lighter portions down the incline, without flowing or disturbing the body of pulp.

This device is extremely simple and inexpensive, as the operation is continuous and automatic, the entire operation being maintained by the hydrostatic pressure in the inside cylinder.

## Construction of the United States Mining Statutes.

Full Decision of the Eureka Consolidated vs. Richmond Consolidated Mining Companies' Suit.

We here give the full decision of the Court in the case of the Eureka Consolidated Mining Company vs. The Richmond Consolidated Mining Company, of Nevada. By stipulation the case was tried in this city before the Hon. Stephen J. Field, Justice of the Supreme Court of the United States; Hon. Lorenzo Sawyer, United States Circuit Judge of the Ninth Circuit; and Hon. E. W. Hillyer, United States District Judge for the District of Nevada. Judge Field delivered the unanimous opinion of the Court.

This is an action for the possession of certain mining ground, particularly described in the complaint, situated in Eureka mining district in the county of Eureka, in the State of Nevada. The plaintiff is a corporation created under the laws of California, and the defendant,

Richards' Improved Buddle.

The Richmond Mining Company, a corporation created under the laws of Nevada. The other defendants, Thomas Wren and Joseph Potts, are citizens of the latter State. The action was originally commenced in a State Court of Nevada, but, upon application of the plaintiff, and upon the ground of its incorporation in another State, and the presumed citizenship, from that fact, of its corporators or stockholders in that State, it was transferred to the Circuit Court of the United States.

The premises in controversy are of great value, amounting by estimation to several hundred thousands of dollars, and the case has been prepared for trial with a care proportionate to this estimate of the value of the property; and the trial has been conducted by counsel on both sides with eminent ability.

Whatever could inform, instruct or enlighten the Court, has been presented by them. Practical miners have given us their testimony as to the location and working of the mine. Men of science have explained to us how it was probable that nature in her processes had deposited the mineral where it is found. Models of glass have made the hill, where the mining ground lies, transparent, so that we have been able to trace the course of the veins, and see the chambers of ore found in its depths. For myself, after a somewhat extended judicial experience, covering now a period of nearly 20 years, I can say that I have seldom, if ever, seen a case involving the consideration of so many and varied particulars, more thoroughly prepared or more ably presented. And what has added a charm to the whole trial has been the conduct of counsel on both sides, who have appeared to assist each other in the development of the facts of the case, and have furnished an illustration of the truth that the highest courtesy is consistent with the most earnest contention.

The mining ground which forms the subject of controversy is situated in a hill known as Ruby hill, a spur of Prospect mountain, distant about two miles from the town of Eureka, in Nevada. Prospect mountain is several miles in length, running in a northerly and

southerly course. Adjoining its northerly end is this spur called Ruby hill, which extends thence westerly, or in a southwesterly direction. Along and through this hill, for a distance slightly exceeding a mile, is a zone of limestone, in which, at different places throughout its length, and in various forms, mineral is found, this mineral appearing sometimes in a series or succession of ore bodies more or less closely connected, sometimes in apparently isolated chambers, and at other times in what would seem to be scattered grains. And our principal inquiry is to ascertain the character of this zone, in order to determine whether it is to be treated as constituting one lode, or as embracing several lodes, as that term is used in the Acts of Congress of 1866 and 1872, under which the parties have acquired whatever rights they possess. In this inquiry the first thing to be settled is the meaning of the term in those Acts. This meaning being settled, the physical characteristics and the distinguishing features of the zone will be considered.

Those Acts give no definition of the term. They use it always in connection with the term vein. The Act of 1866 provided for the acquisition of a patent by any person or association of persons claiming "a vein or lode of quartz, or other rock in place, bearing gold, silver, cinnabar or copper." The Act of 1872 speaks of veins or lodes of quartz or other rock in place, bearing similar metals or ores. Any definition of the term should, therefore, be sufficiently broad to embrace deposits of the several metals or ores here mentioned. In the construction of statutes, general terms must receive that interpretation which will include all the instances enumerated as comprehended by them. The definition of a lode given by geologists is, that of a fissure in the earth's crust filled with mineral matter, or more accurately, an aggregation of mineral matter containing ores in fissures. (See Von Cotta's Treatise on Ore Deposits, Prime's Translation, 26.) But miners used the term before geologists attempted to give it a definition. One of the witnesses in this case, Dr. Raymond, who for many years

Boesch's Corrugated Glass Reflector.

was in the service of the General Government as Commissioner of Mining Statistics, and in that capacity had occasion to examine and report upon a large number of mines in the States of Nevada and California and the Territories of Utah and Colorado, says that he has been accustomed as a mining engineer to attach very little importance to those cases of classifications of deposits which simply involve the referring of the subject back to verbal definitions in the books. The whole subject of the classification of mineral deposits, he states, to be one in which the interests of the miner have entirely overridden the reasonings of the chemists and geologists. "The miners," to use his language, "made the definition first. As used by miners, before being defined by any authority, the term lode simply meant that formation by which the miner could be led or guided. It is an alteration of the verb lead; and whatever the miner could follow, expecting to find ore, was his lode. Some formation within which he could find ore, and out of which he could not expect to find ore, was his lode." The term lodestar, guiding star, or north star, he adds, is of the same origin. Cinnabar is not found in any fissure of the earth's crust, or in any lode as defined by geologists, yet the Acts of Congress speak, as already seen, of lodes of quartz, or rock in place bearing cinnabar. Any definition of lode as there used, which did not embrace deposits of cinnabar, would be as defective as if it did not embrace deposits of gold or silver. The definition must apply to deposits of all the metals named, if it apply to a deposit of any one of them. Those Acts were not drawn by geologists or for geologists; they were not framed in the interests of science, and consequently with scientific accuracy in the use of terms. They were framed for the protection of miners in the claims in which they had located and developed, and should receive such a construction as will carry out this purpose. The use of the terms vein and lode in connection with each other in the Act of 1866, and their use in connection with the term ledge in the Act of 1872, would seem to indicate that it was the object of the legislator to avoid any limitation

in the application of the Acts which a scientific definition of any one of these terms might impose.

It is difficult to give any definition of the term, as understood and used in the Acts of Congress, which will not be subject to criticism. A fissure in the earth's crust—an opening in its rocks and strata made by some force of nature, in which the mineral is deposited, would seem to be essential to the definition of a lode in the judgment of geologists. But to the practical miner, the fissure and its walls are only of importance as indicating the boundaries within which he may look for and reasonably expect to find the ore he seeks. A continuous body of mineralized rock lying within any other well defined boundaries on the earth's surface and under it, would equally constitute, in his eyes, a lode. We are of opinion, therefore, that the term as used in the Acts of Congress is applicable to any zone or belt of mineralized rock lying within boundaries clearly separating it from the neighboring rock. It includes, to use the language cited by counsel, all deposits of mineral matter found through a mineralized zone or belt coming from the same source, impressed with the same forms, and appearing to have been created by the same processes.

Examining, now, with this definition in mind, the features of the zone which separate and distinguish it from the surrounding country, we experience little difficulty in determining its character. We find that it is contained within clearly defined limits, and that it bears unmistakable marks of originating, in all its parts, under the influence of the same creative forces. It is bounded on the south side, for its whole length, at least so far as explorations have been made, by a wall of quartzite of several hundred feet in thickness; and on its north side, for a like extent, by a belt of clay or shale, ranging in thickness from less than an inch to 70 or 80 feet. At the east end of the zone, in the Jackson mine, the quartzite and shale approach so closely as to be separated by a bare seam, less than an inch in width. From that point they diverge, until on the surface in the Eureka mine, they are about 500 feet apart, and on the surface in the Richmond mine, about 800 feet. The quartzite has a general dip to the north, at an angle of about 45°, subject to some local variations, as the course changes. The clay or shale is more perpendicular, having a dip at an angle of about 80°. At some depth under the surface, these two boundaries of the limestone, descending at their respective angles, may come together. In some of the levels worked, they are now only from 200 to 300 feet apart.

The limestone found between these two limits—the wall of quartzite and the seam of clay or shale—has, at some period of the world's history, been subjected to some dynamic force of nature, by which it has been broken up, crushed, disintegrated, and fissured in all directions, so as to destroy, except in three or four places of a few feet each, so far as explorations show, all traces of stratification; thus specially fitting it, according to the testimony of the men of science to whom we have listened, for the reception of the mineral which, in ages past, came up from the depths below in solution, and was deposited in it. Evidence that the whole mass of limestone has been, at some period, lifted up and moved along the quartzite, is found in the marks of attrition engraved on the rock. This broken, crushed and fissured condition pervades, to a greater or less extent, the whole body, showing that the same forces which operated upon a part operated upon the whole, and at the same time. Wherever the quartzite is exposed, the marks of attrition appear. Below the quartzite no one has penetrated. Above the shale the rock has not been thus broken and crushed. Stratification exists there. If in some isolated places there is found evidence of disturbance, that disturbance has not been sufficient to affect the stratification. The broken, crushed and fissured condition of the limestone gives it a specific, individual character, by which it can be identified and separated from all other limestone in the vicinity.

In this zone of limestone numerous caves or chambers are found, further distinguishing it from the neighboring rock. The limestone being broken and crushed up as stated, the water from above readily penetrated into it, and operating as a solvent, formed these caves and chambers. No similar cavities are found in the rock beyond the shale, its hard and unbroken character not permitting, or at least opposing such action from the water above.

Oxide of iron is also found in numerous places throughout the zone, giving to the miner assurance that the metal he seeks is in its vicinity.

This broken, crushed and fissured condition of the limestone, the presence of the oxides of iron, the caves or chambers we have mentioned, with the wall of quartzite and seam of clay bounding it, give to the zone, in the eyes of the practical miner, an individuality, a oneness as complete as that which the most perfect lode in a geological sense ever possessed. Each of the characteristics named, though produced at a different period from the others, was undoubtedly caused by the same forces operating at the same time upon the whole body of the limestone.

Throughout this zone of limestone, as we have already stated, mineral is found in the numerous fissures of the rock. According to the opinions of all the scientific men who have been examined, this mineral was brought up in

### Improved Mining Machinery.

The Virginia Enterprise says: Persons now visiting the Comstock, who have not been here since the early days, are much surprised to see the huge engines employed in all our large mills and in the hoisting works of the leading mines. The ponderous pumping machinery is also looked upon with astonishment, and contrasted with the slight and feeble apparatus that did duty in the same line of business in former times.

#### In the Early Days of Washoe

The stockholders of a mining company stood aghast and were amazed almost to speechlessness when their Superintendent ventured to ask for an engine of 60 or 80-horse power. They thought the company would be ruined by such extravagant notions. When such engines were finally procured and set up in the mills and hoisting works, a day was appointed and scores of people—ladies as well as gentlemen—were invited to see them put in motion. A great feast was provided and spread in some part of the new works; speeches were made,

#### Champagne Flowed Like Water,

And beer was drank by the barrel. Occasionally a band of music was present, and dancing concluded the festivities. Companies that had paid out sufficient money to purchase an engine of 80 or 100-horse power became reckless, as it were, and no longer cared for expenses. Now engines of 500-horse power are started up and nobody except those particularly interested know anything about the matter; and without a word to outsiders, pumps are put in motion that would have torn down the works of early days and washed all the revelers collected in them down the sides of the mountain. All the machinery in our primitive hoisting works wouldn't have furnished ballast for a balance hoh of the present day, and a section of the column now in use would then have made a first-class smokestack.

#### Yellow Jacket New Machinery.

The machinery which is being put in at the Yellow Jacket new shaft, and in process of construction for the works there, is, in many respects, a step or two in advance of anything on the lode. Both building and machinery have been designed and are being constructed under the supervision of William H. Patton, of this city, civil and mechanical engineer, who has designed and constructed the improved machinery at the Consolidated Virginia, C. & C. shaft, Gould & Curry, Savage, Hale & Norcross, Chollar-Norcross-Savage shaft, Belcher, Overman, and other mines, and to whose study, research, invention and skill most of the improvements in Comstock machinery may be traced. The improvements made in the new machinery of the Yellow Jacket new shaft are worthy of a more particular mention than has yet been made of them.

#### The Hoisting Machinery

Consists of a double-cylinder engine, each cylinder being 18 inches in diameter and 24-inch stroke. These cylinders run two reels, each capable of holding 3,000 feet of flat wire rope half an inch thick and from four to six inches wide. The north reel is intended to handle all of the pumping machinery, and is constructed in such a manner as to multiply, when desired, the power of the engine six times, thereby giving it a lifting power of 50 tons. When not needed as a lifting engine it will be used in the same manner precisely as the south reel. This double engine is capable of sinking 3,000 feet, and of handling the pumps to that depth. In case ore is found, additional machinery will be erected to handle it.

#### The Design

Of the hoisting machinery is different from anything on the lode. It is extremely heavy and substantial, and calculated to do an immense amount of work. The gallow's frame is similar to that at the C. & C. shaft. The sheaves are placed on the top of the frame to avoid any danger of their getting out of place. The frame itself is built of selected timbers of red mountain spruce, cut at Dutch Flat, and is securely anchored to the foundation walls. It is arranged so as to allow of two landings, the same as at the C. & C. shaft, where it is found to work admirably, nearly doubling the hoisting capacity of the works. By this device four deck cages can be unloaded with only two landings. For the purpose of sinking a skip it will be used similar to that at the Combination shaft.

#### The Buildings

Will be of the same general style as those at the C. & C. shaft. That covering the hoisting works will be 42 feet wide by 140 feet deep. It is constructed so that the highest portion of the building will be directly over the shaft, and contain the ventilator. By this arrangement, no useless space is inclosed, the highest portion being over the shaft and sheaves, and the lowest over the engine, the roof approximately conforming to the slant of the cables. The building is detached entirely from the gallow's frame, so that no jar will be conveyed therefrom to the building.

#### The Boiler Room.

Provision is made for setting five pairs of boilers, which will be placed on the north side of the main building and 10 feet below the hoisting engines. This has been found to be the most economical as well as safest position for boilers in this section. The prevailing winds being from the south, the sparks are driven away from the works, while the sweep is not so directly upon the hoilers, steam drums and connecting pipes. The hoilers will be

covered by a building 48 feet wide, leaning up against the main building, and of sufficient height to give perfect ventilation to the boiler room. For the purpose of receiving the hoilers a yard sufficient for the building and to receive wood, etc., is being graded out.

#### The Pumping Engine

Is to be a compound condensing, direct-acting, rotative engine. The initial cylinder is 31 inches, the expansion cylinder 62 inches, and each has a 12-foot stroke. They are to be placed horizontally and along side of each other. The crosshead of the engine will connect directly with the head of the surface boh, and also with two fly wheels of 50 tons weight each, placed on a shaft 18 inches in diameter, and one on each side of the boh pit, thus avoiding the use of the Davy valve motion. It has been found in practice that where less than four strokes per minute of the pumps will handle the water, the Davy valve gear is advantageous, but where more than four are required, that a plain rotative engine is preferable. This pumping engine will be

#### The Most Powerful Engine on the Lode.

The pump columns are to be 14 inches in diameter, and the plunger pumps will be 14 inches in diameter by 10-foot stroke. Besides these there will be a sinking lift. The plungers are to be placed 200 feet apart in the shaft and in the usual Cornish style. The building for the pumping engine will be 61 feet wide by 90 feet long, and placed on the north side of the main hoisting building. The hoisting machinery was built by Prescott, Scott & Co., of San Francisco, and the pumping machinery is now being built by the same firm.

#### The Welland Canal.

This work is progressing satisfactorily, although not as rapidly as was at first hoped, owing to certain obstructions that were not foreseen. The work now in progress will, when completed, result in the establishment of a navigable canal with locks 270 feet long and 45 feet wide, with 14 feet depth on the sills, the canal proper having a width of 100 feet at the bottom, with a depth of 15 feet. For the present the depth of the new canal between the locks is 13 feet. The locks, which can hereafter be raised with moderate expense, are at present constructed with 12 feet on the sill. In regard to the details of this work the Chicago Railway Review says that the entrance and other locks not coming within this category are constructed with a depth of 14 feet. The new canal leaves the present line and continues from May's ravine on a separate location  $8\frac{1}{2}$  miles, and is one-third of a mile shorter than the present canal.

Work is vigorously pushed forward on all the sections. Section No. 36 embraces the enlargement and deepening of Port Colborne harbor, or Lake Erie entrance to the canal, including the extension of the west pier about 400 feet further into the lake; deepening the entrance channel from the lake inward; rebuilding the superstructure of part of the west pier, and the whole of that on the east side; constructing a beacon on the southeast side of the entrance, and building four detached hlocks of pier work between it and the outer end of the present east pier; renewing and rebuilding about 700 feet of the west docking; deepening and enlarging the basin, etc.

The channel from the lake northward to about the southern line of the contemplated enlargement of the basin is to be sunk to a depth of 17 feet below low water line, and from the latter place to the north end of the basin the depth will gradually diminish to 16 feet at a time when the water stands at 12 feet over the miter-sill of the present lock. In excavating through the rock, the mode adopted has been to drill and blast from the deck of a vessel, held in place by anchor timber resting on the bottom, and subsequently removing the loosened material by an ordinary scoop-dredging machine. This system has been so far quite successful, owing in a great measure to the use of nitro-glycerine as an explosive and the skillful arrangements made in conducting operations in all their stages. Still, with all the care and precautions adopted in storing and handling the nitro-glycerine, an explosion occurred on the 30th of October last, by which one man was killed and considerable damage done to property in the village of Port Colborne. Fully one-third of the rock has been removed and a considerable extent of ordinary dredging done. The time for completing the work was to have been the spring of 1877; but it is now understood that it will not be ready before the opening of navigation in 1880. In conclusion, the Review says: "When the improvement is completed vessels of the largest class can be locked down from Lake Erie into Lake Ontario, and vice versa, and, with the enlargement of the St. Lawrence canals, ships of over 2,500 tons burden can clear from Chicago for any part of the world, and return with cargoes shipped on through hills of lading, thus making this city the grand port of entry for an immense fleet of vessels and a direct trade, the magnitude of which cannot be estimated nor approximated at the present time."

However much this may be desired, it is not likely to take place to any considerable extent, because of the different requirements of lake and ocean navigation. The models and rig which are altogether best for salt water, are not as well adapted for fresh water navigation; hence the lake tonnage will not probably make foreign voyages, although it may be pretty extensively employed along the Atlantic coast.

### A New Utah Concentrator.

A correspondent of the Salt Lake Tribune says: Through the courtesy of E. W. Day, I visited the new automatic ore sampler of R. W. McIntosh, on Friday, and saw it start up and run a sample through. It worked so perfect that the projectors and builder of it, who were there at the time, as well as the spectators, pronounced it beyond a doubt a grand success. It takes up so little space on the floor that it does not interfere in any way with the old machinery used so successfully heretofore, and persons who prefer to have their ore sampled by the old process can be accommodated at any moment. The object of the new process is to give the miner a better sample at cheaper rates and in a great deal less time than he could get it by the old-fashioned way.

The machinery consists of crusher, elevator, with receiving and distributing hoppers and cast-iron dividers. It stands on a solid foundation, 42 feet high from the floor, with a reduction capacity of from 2,000 to 3,000 pounds. The capacity of the mill, when run at best advantage, is 10 tons per hour.

The ore to be sampled first passes into a crusher, is there pulverized, and then taken direct from the crusher to the elevator, which carries it up to a tipping hopper. When the tipping hopper contains about 250 pounds of ore, it discharges itself into the first of a series of six sampling boppers.

After the ore reaches the first sampling hopper, the gates at the bottom of the same open and discharge the ore evenly upon dividers. These dividers are so arranged that they take every alternate quarter, the same as is done by hand sampling on the floor. The sampling hopper is so constructed that the ore must pass from one to the other, and each time the ore reaches the next hopper in its descent it is thoroughly mixed, thereby mixing every 250 pounds equal to the whole lot as heretofore. The machine is so perfectly arranged that there cannot possibly be the ghost of a show for any person to tamper with a sample. The car which contains the sample is inclosed in a casing, which is 14x18 feet at the base, and runs up over the top to a barrel. This case is in charge of the foreman, who takes the key thereof until the sample is delivered to the plate room.

The designer of this machine is F. W. Day, and the work was perfected and machinery put up in first-class running order by W. J. Silver, of Salt Lake City. Another grand feature about it is, that every part of this new enterprise is home-made and entirely original. Already patents have been applied for, and Dick McIntosh has reason to congratulate himself on its success, for it is bound to be a great source of revenue to him and others who may be connected with it.

### French Railway System.

In a memoir of M. de Franqueville, M. F. Jacquin reviews the relations between the railways and the state, in different countries, coming to the conclusion that France alone has solved the difficult problem of reconciling these two grand principles: authority and liberty. The whole territory of France is divided into six grand railway departments, in each of which, with a few unimportant exceptions, all the railways have been conceded to a single company.

Office hooks, very well devised, define the rights of the state and those of the company. Free to move within prescribed limits, the administrative councils and their immediate subordinates strive to develop commercial relations, or even to create them where they do not already exist.

In each department the different modes of technical working, the improvements to be made in the rolling stock, the questions relative to maintenance, to beneficial funds, and to retiring pensions for a clientele of more than 200,000 men, are all daily and carefully studied under different aspects, the very diversity of view furnishing guarantees of true progress and success.

At the same time the state, invested with important rights, by those same office hooks, exercises a continual surveillance over the companies. By the engineers of control and the subordinate commissioners, it is informed of the least incident which occurs on the roads. No tax is collected without having been confirmed—that is to say, without it has been shown by thorough examination that it is according to conditions of the contract. By inspection of finances the state penetrates into all the details of the combined action of the companies.

In time of peace the state is thus in a position to intervene at any instant in the management of the railway companies, and to protect the public, if necessary, against monopoly. In time of war, the immense property of the companies, together with their numerous discipline and systematized corps, pass under the control of the state; the workshops of the companies, true arsenals, are ready to execute the most difficult commands, to grind wheat and to make arms.

In fine, in 80 years, the entire network, which will have cost nearly \$3,000,000,000, will be completely redeemed; all the capital and bonds will be reimbursed by annual levies on the working receipts, and the state will enter into full possession of a property sufficient to extinguish the public debt.

This system of equilibrium between the state and the companies, which the English call the

"French system," may thus briefly be defined:

The association of the state and the companies, formed in order to assure the completion of the national network of railways, the advantages of the prosperous lines being partly employed for the benefit of the unproductive lines.

### Wagon Materials.

To those who have never investigated the matter, the extent of the trade in materials for the construction of wagons in this city, is beyond their comprehension. It is simply enormous, and employs hundreds of thousands of capital, several large buildings and many men. Knowing the extent to which the importation of State built wagons had lately been carried, to us it seemed incredible that such an amount of the raw material should be required to supply the trade, as we found stored upon the premises of Meeker, James & Co. We found their large store 45x137, on Market, stored full from top to bottom, and another warehouse of equal size on Spear street piled full of plank used in wagon building. To be sure this is the leading firm in this business here, but it is not the only one, and when we reflect that several other firms are also in this trade, and one or two nearly as heavily as Messrs. M., J. & Co., some idea of the extent of the carriage and wagon makers' operations on the Pacific coast may be obtained.

Meeker, James & Co. make a fine representative exhibit of their stock in the northwest corner of the pavilion, very tastily and snugly arranged, and we found therein so many of the improvements of the past five years in carriage findings, that we were at a loss to name them all, and concluded to go to their regular establishment, No. 117 and 119 Market street, and brush up our carriage sense a little. We found out that a workman can build a buggy or wagon for 20% less now than he could ten years ago, by reason of the material being so much better fitted to his hand by machinery than used to be the case. We found out that there is nothing required in the building of either carriage, buggy, or wagon, that was not to be had in this complete establishment. We found there spokes of the finest timber from  $\frac{3}{4}$  to 5 inches, by the cord; we found bent rims from 1 inch to 8 inches wide; hubs from 3 inches to 17 inches; basswood, white wood, ash, oak, hickory, and other plank of the finest quality, dry and hard as baked bones; carriage hardware of the latest patterns and patents including fifth wheels of a pattern made exclusively for this house; half patent and Concord axles of iron, steel, and converted steel, all sizes. We also found that clips are now being pressed of the required shapes and sizes for all work, out of the best wrought Norway iron, that are far better and a hundred per cent. cheaper than hand welded and made ones; steps, foot rails, seat irons, pole and single tree irons of wrought iron, and many other such things that ordinarily have been left for the blacksmith to forge out laboriously by hand or were made of malleable cast iron, which any one knows is inferior to wrought. It is this pressing of clips, rails, steps, and similar carriage furnishing articles, that has made vehicles cheaper and better in the market than formerly.

Messrs. Meeker, James & Co., are sole agents for their premises. They are also sole agents for the celebrated rubber-cushioned axles that are now so generally coming into use in Eastern cities. This is an adaptation of rubber to wagon wheels, whereby the boxes that convey the axles rest on rubber, and the whole load is as it were on springs in the wheel, thereby relieving the wheel and spindle of the jar and strain consequent to heavy loads over rough pavement, to say nothing of the saving on teeth it is to the driver. They are also agents for Silver & Deming's patent hub boxing machine, and their improved spoke-tenoning machine, both of which are invaluable auxiliaries to correct wheel building, and are on exhibition in the pavilion. They also are agents for Sarvin patent wheels, of which they sold 350 sets in 1876. For country use they cannot be excelled by any wheel built, though not so well liked in the city on the rough stone pavement.—*Fair Daily.*

MARINE SOUNDING LINE.—M. Ch. Tardieu employs a spherical envelope of caoutchouc, communicating with an iron reservoir by means of a small tube which is provided with a valve. The envelope being filled with mercury, any increase of external pressure forces into the reservoir some of the mercury, which cannot return on account of the valve. The weight of the mercury determines the pressure, and consequently the depth of the water.

PUGNACIOUS PLANT.—The *Phytolacca electrica*, a plant lately discovered in Nicaragua, gives a shock to the hand when one attempts to break off a branch.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dwyer & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, bound, \$2.00. Address, Dwyer & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

## ARITHMETIC MADE EASY.

ROPP'S  
EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months. The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address

CAUTION  
TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 10th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

## The Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS, SCIENTIFIC  
 AND INDUSTRIAL MEN,

Is now in its THIRTY-FIFTH Volume. It has ever been, and will continue to be, the aim and object of the publishers to make the Press

## A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of our editors and correspondents, to seize upon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and to place the same before our readers at the earliest day. It has been well said that

## A Newspaper is a Window

Through which men look upon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

## In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop, and can know but little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress books are necessarily slow and behind the times. It is only through papers devoted to the specialty which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a laggard in the race.

## The Value to the Community

Of such publications in disseminating important information, in checking useless and exploded experiments, and in instigating important enterprises, can scarcely be overrated. Through them the findings and observations of thousands are collected and collated, and brought directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of just the information he needs—an unbound book forever issuing but never finished.

## Nowhere in the Wide World

Is such an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

## The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here, also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world,

## Useful, Practical and Directly from the Field

Of labor. The mustiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

## Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of such help our editors will be able, during the coming months, to do more than ever in furnishing information which shall be

## Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

## Our Illustration Department

Will still always form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

## Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

## The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this have no need to be anything more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million," and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

P. O. Address: ALAMEDA, CAL.

Continued from page 153

solution from the depths of the earth below, and would therefore naturally be very irregularly deposited in the fissures of the crushed matter, as these fissures are in every variety of form and size, and would also find its way in minute particles in the loose material of the rock. The evidence shows that it is sufficiently diffused to justify giving to the limestone the general designation of mineralized matter—metal-bearing rock. The three scientific experts produced by the plaintiff, Mr. Keyes, Mr. Raymond and Mr. Hunt, all of them of large experience and extensive attainments, and two of them of national reputation, have given it as their opinion, after examining the ground, that the zone of limestone between the quartzite and the shale constitutes one vein or lode, in the sense in which those terms are used by miners. Mr. Keyes, who for years was superintendent of the mine of the plaintiff, concludes a minute description of the character and developments of the ground by stating that, in his judgment, according to the customs of miners in this country and common sense, the whole of that space should be considered and accepted as a lead, lode, or ledge of metal-bearing rock in place.

Dr. Raymond, after giving a like extended account of the character of the ground, and his opinion as to the causes of its formation, and stating with great minuteness the observations he had made, concludes by announcing as his judgment, after carefully weighing all that he had seen, that the deposit between the quartzite and the shale is to be considered as a single vein in the sense in which the word is used by miners—that is, as a single ore deposit of identical origin, age and character throughout.

Dr. Hunt, after stating the result of his examination of the ground, and his theory as to the formation of the mine, gives his judgment as follows:

"My conclusion is this: That this whole mass of rock is impregnated with ore; that although the great mass of ore stretches for a long distance above horizontally and along an incline down the foot wall, as I have traced it, from this deposit you can also trace the ore into a succession of great cavities or bonanzas lying irregularly across the limestone and into smaller caverns or chasms of the same sort; and that the whole mass of the limestone is irregularly impregnated with the ore. I use the word impregnation in the sense that it has penetrated here and there; little patches and stains, ore-veins, and caverns and spaces of all sizes and all shapes, irregularly disseminated through the mass. \* \* \* I conclude, therefore, that this great mass of ore is, in the proper sense of the word, a great lode, or a great vein, in the sense in which the word is used by miners; and that practically the only way of utilizing this deposit, is to treat the whole of it as one great ore-bearing lode or mass of rock."

This conclusion as to zone constituting one lode of rock-bearing metal, it is true, is not adopted by the men of science produced as witnesses by the defendant, the Richmond mining company. These latter gentlemen, like the others, have had large experience in the examination of mines, and some of them have acquired a national reputation for their scientific attainments. No one questions their learning or ability, or the sincerity with which they have expressed their convictions. They agree with the plaintiff's witnesses as to the existence of the mineralized zone of limestone, with an underlying quartzite and an overlying shale; as to the broken and crushed condition of the limestone, and substantially as to the origin of the metal and its deposition in the rock. In nearly all other respects they disagree. In their judgment, the zone of limestone has no features of a lode. It has no continuous fissure, says Mr. King, to mark it as a lode. A lode, he adds, must have a foot wall and a hanging wall, and if it is broad, these must connect at both ends and must connect downwards. Here there is no hanging wall or foot wall; the limestone only rests as a matter of stratigraphical fact on underlying quartzite and the shale overlies it. And distinguishing the structure at Ruby hill from the Comstock lode, the same witness says that the one is a series of sedimentary beds laid down in the ocean and turned up; the other is a fissure extending between two rocks.

The other witnesses of the defendant, so far as they have expressed any opinion as to what constitutes a lode, have agreed with the views of Mr. King. It is impossible not to perceive that these gentlemen at all times carried in their minds the scientific definition of the term as given by geologists—that a lode is a fissure in the earth's crust filled with mineral matter—and disregarded the broader, though less scientific definition of the miner, who applies the term to all zones or belts of metal-bearing rock lying within clearly marked boundaries. For the reasons already stated, we are of opinion that the Acts of Congress use the term in the sense in which miners understand it.

If the scientific definition of a lode, as given by geologists, could be accepted as the only proper one in this case, the theory of distinct veins existing in distinct fissures of the limestone, would be not only plausible but reasonable, for that definition is not met by the conditions in which the Eureka mineralized zone appears. But as that definition cannot be accepted, and the zone presents the case of a lode as that term is understood by miners, the theory of separate veins, as distinct and disconnected bodies of ore, falls to the ground. It is,

therefore, of little consequence what name is given to the bodies of ore in the limestone, whether they be called pipe veins, rake veins or pipes of ore, or receive the new designation suggested by one of the witnesses, they are but parts of one greater deposit, which permeates, in a greater or less degree, with occasional intervening spaces of barren rock, the whole mass of limestone, from the Jackson mine to the Richmond, inclusive.

The Acts of Congress of 1866 and 1872 dealt with a practical necessity of miners; they were passed to protect locations on veins or lodes, as miners understood those terms. Instances without number exist where the meaning of words in a statute has been enlarged or restricted and qualified to carry out the intention of the Legislature. The inquiry, where any uncertainty exists, always is as to what the Legislature intended, and when that is ascertained, it controls. In a recent case before the Supreme Court of the United States, singing birds were held not to be live animals, within the meaning of a Revenue Act of Congress. (*Reiche v. Smythe*, 13 Wall, 162.) And in a previous case, arising upon the construction of the Oregon Donation Act of Congress, the term, a single man, was held to include in its meaning an unmarried woman. (*Silver v. Ladd*, 7 Wall, 219.) If any one will examine the two decisions, reported as they are in Wallace's Reports, he will find good reason, for both of them.

Our judgment being that the limestone zone in Ruby hill, in Eureka district, lying between the quartzite and the shale, constitutes, within the meaning of the Acts of Congress, one lode of rock-bearing metal, we proceed to consider the rights conveyed to the parties by their respective patents from the United States. All these patents are founded upon previous locations, taken up and improved according to the customs and rules of miners in the district. Each patent is evidence of a perfected right in the patentee to the claim conveyed, the initiatory step for the acquisition of which was the original location. If the date of such location be stated in the instrument, or appear from the record of its entry in the local land office, the patent will take effect by relation as of that date, so far as may be necessary to cut off all intervening claimants, unless the prior right of the patentee, by virtue of his earlier location, has been lost by a failure to contest the claim of the intervening claimant, as provided in the Act of 1872. As in the system established for the alienation of the public lands, the patent is the consummation of a series of acts, having for their object the acquisition of the title, the general rule is to give to it an operation by relation at the date of the initiatory step, so far as may be necessary to protect the patentee against subsequent claimants to the same property. As was said by the Supreme Court in the case of *Shepley vs. Cowan* (1st Otto, 338), where two parties are contending for the same property, the first in time in the commencement of proceedings for the acquisition of the title, when the same are regularly followed up, is deemed to be the first in right.

But this principle has been qualified in its application to patents of mining ground, by provisions in the Act of 1872, for the settlement of adverse claims before the issue of the patent. Under that Act, when one is seeking a patent for his mining location and gives proper notice of the fact as there prescribed, any other claimant of an unpatented location objecting to the patent of the claim, either on account of its extent or form, or because of asserted prior location, must come forward with his objections and present them, or he will afterwards be precluded from objecting to the issue of the patent. While, therefore, the general doctrine of relation applies to mining patents so as to cut off intervening claimants, if any there can be, deriving title from other sources, such perhaps as might arise from a subsequent location of school warrants or a subsequent purchase from the State, as in the case of *Heydenfeldt vs. Daney Gold Mining Company*, reported in the third of Otto, the doctrine cannot be applied so as to cut off the rights of the earlier patentee, under a later location, where no opposition to that location was made under the statute. The silence of the first locator is, under the statute, a waiver of his priority.

But from the view we take of the rights of the parties under their respective patents, and the locations upon which those patents were issued, the question of the priority of location is no practical consequence in the case.

The plaintiff is the patentee of several locations on the Ruby Hill lode, but for the purpose of this action it is only necessary to refer to three of them—the patents for the Champion, the At Last, and the Lupita or Margaret claims. The first of these patent was issued in 1872, the second in 1876, and the third in 1877. Within the end lines of the locations, as patented in all these cases, when drawn down vertically through the lode, the property in controversy falls. Objection is taken to the validity of the last two patents, because the end lines of the surface locations patented are not parallel, as required by the Act of 1872. But to this objection there are several obvious answers. In the first place, it does not appear upon what locations the patents were issued. They may have been, and probably were, issued upon locations made under the Act of 1866, where such parallelism in the end lines of the surface locations was not required. The presumption of the law is that the officers of the Executive Department specially charged with the supervision of applications for mining patents, and the issues of such patents, did their duty; and

in an action of ejectment, mere surmises to the contrary will not be listened to. If, under any possible circumstances, a patent for a location without such parallelism may be valid, the law will presume that such circumstances existed. A patent of the United States for land, whether agricultural or mineral, is something upon which its holder can rely for peace and security in his possessions. In its potency it is ironclad against all mere speculative inferences. In the second place, the provision of the statute of 1872, requiring the lines of each claim to be parallel to each other, is merely directory, and no consequence is attached to a deviation from its direction. Its object is to secure parallel end lines drawn vertically down, and that was effected in these cases by taking the extreme points of the respective locations on the length of the lode. In the third place, the defect alleged does not concern the defendant, and no one but the Government has the right to complain.

The defendant, the Richmond mining company, also holds several patents issued to it upon different locations; but in this case it specially relies upon the patents of the Richmond and Tip Top claims. It is alleged that these patents were issued upon locations made earlier than any upon which the patents to the plaintiff were issued. Assuming this to be the fact, and claiming from it that the patents antedate in their operation, by relation back to such locations, the patents of the plaintiff; and the further fact that the locations were made under the Act of 1866, the defendant relies to defeat the pretensions of the plaintiff. It contends that inasmuch as the croppings of the vein it works are within the surface of its patented locations, it can follow the vein wherever it leads, though it be outside of the end lines of the locations when vertically drawn down through the lode. Its position is that, whenever, under the law of 1866, a location was made on a lode or vein, a right was acquired to follow the vein wherever it might lead, without regard to the end lines of the location. This position is urged with great persistence by one of the counsel of the defendant, and with the ability which characterizes all his discussions.

The second section of the Act of 1866, upon the provisions of which this position is based, provides, "That whenever any person or, association of persons, claims a vein or lode of quartz, or other rock in place, bearing gold, silver, cinnabar or copper, having previously occupied and improved the same according to local customs or rules of miners in the district where the same is situated, and having expended, in actual labor and improvements thereon, an amount of not less than \$1,000, and in regard to whose possession there is no controversy, or opposing claim, it shall and may be lawful for said claimant or association of claimants to file in the local land office a diagram of the same, so extended, laterally or otherwise, as to conform to the local laws, customs and rules of miners, and to enter such tract and receive a patent therefor, granting such mine, together with the right to follow such vein or lode, with its dips, angles and variations to any depth, although it may enter the land adjoining, which land adjoining shall be sold subject to this condition."

It will be seen by this section that to entitle a party to a patent, his claim must have been occupied and improved according to the local customs or rules of miners of the district, and that his diagram of the same filed in the land office, in its extension, laterally or otherwise, must be in conformity with them.

The rules of the miners in the Eureka mining district, adopted in 1865—laws of the district, as they are termed by the miners—provided that claims of mining ground should be made by posting a written notice on the claimant's ledge, defining its boundaries if possible; that each claim could consist of 200 feet on the ledge, but claimants might consolidate their claims by locating in a common name, if in the aggregate no more ground was claimed than 200 feet for each name, and that each locator should be entitled to all dips, spurs and angles connecting with his ledge; and that a record of all claims should be made within 10 days from the date of location. The rules also allowed claimants to hold 100 feet each side of their ledge for mining and building purposes, but declared that they should not be entitled to any other ledge within this surface.

It will be perceived by these rules that they had reference entirely to locations of claims on ledges. It would seem that the miners of the district then supposed that the mineral in the district was only found in veins or ledges, and not in isolated deposits. In February, 1869, new rules were added to those previously passed, authorizing the location of such deposits. These new rules provided that each deposit claim should consist of 100 feet square, and that the location should take all the mineral within the ground to any depth.

Under these rules square locations and linear locations were made by parties, through whom the defendant derives title on what is called the Richmond ledge, and linear locations were made on what is called the Tip Top ledge, with surface locations for mining purposes, both parties claiming with their locations all dips, spurs and angles. It is only of the linear locations we have occasion to speak; it is under them that the defendant asserts title to the premises in controversy.

Now as neither the rules of miners in Eureka mining district, nor the Act of 1866, in terms, speak of end lines to locations made on ledges, nor in terms impose any limitation upon miners

following these veins wherever they may lead, it is contended that no such limitation can be considered as having existed and be enforced against the defendant. The Act of 1866, it is said, recognizes the right of the locator to follow his vein outside of any end lines drawn vertically down when it permits him to obtain a patent granting his mine, "together with the right to follow such vein or lode with its dips, angles and variations to any depth, although it may enter the land adjoining, which land adjoining shall be sold subject to this condition."

It is true that end lines are not in terms named in the rules of the miners, but they are necessarily implied, and no reasonable construction can be given to them without such implication. What the miners meant by allowing a certain number of feet on a ledge was that each locator might follow his vein for that distance on the course of the ledge, and to any depth within that distance. So much of the ledge he was permitted to hold as lay within vertical planes drawn down through the end lines of his location, and could be measured anywhere by the feet on the surface. If this were not so, he might, by the bend of his vein, hold under the surface along the course of the ledge double and treble the amount he could take on the surface. Indeed, instead of being limited by the number of feet prescribed by the rules, he might, in some cases, oust all his neighbors and take the whole ledge. No construction is permissible which would substantially defeat the limitation of quantity on a ledge, which was the most important provision in the whole system of rules.

Similar rules have been adopted in numerous mining districts, and the construction thus given has been uniformly and everywhere followed. We are confident that no other construction has ever been adopted in any mining district in California or Nevada. And the construction is one which the law would require in the absence of any construction by miners. If, for instance, the State were to-day to deed a block in the city of San Francisco to 20 persons, each to take 20 feet front, in a certain specified succession, each would have assigned to him by the law a section parallel with that of his neighbor, of 20 feet in width, cut through the block. No other mode of division would carry out the grant.

The Act of 1866 in no respect enlarges the right of the claimant beyond that which the rules of the mining district gave him. The patent which the Act allows him to obtain does not authorize him to go outside of the end lines of his claim, drawn down vertically through the ledge or lode. It only authorizes him to follow his vein, with its dips, angles and variations, to any depth, although it may enter land adjoining, that is, land lying beyond the area included within his surface lines. It is land lying on the side of the claim, not on the ends of it, which may be entered. The land on the ends is reserved for other claimants to explore. It is true, as stated by the defendant, that the surface land taken up in connection with a linear location on the ledge or lode is, under the Act of 1866, intended solely for the convenient working of the mine, and does not measure the miner's right, either to the linear feet upon its course, or to follow the dips, angles and variations of the vein, or control the direction he shall take. But the line of location taken does measure the extent of the miner's right. That must be along the general course or strike, as it is termed, of the ledge or lode. Lines drawn vertically down through the ledge or lode at right angles with a line representing this general course, at the ends of the claimant's line of location, will carve out, so to speak, a section of the ledge or lode within which he is permitted to work, and out of which he cannot pass.

As the Act of 1866 requires the applicant for a patent to file in the local office a diagram of his claim, such diagram must necessarily present something more than the mere linear location. It is intended that it should embrace the surface claimed, for the working of the mine. In this way each of the patents of the parties embraces one or more acres and the fraction of an acre of surface ground and some hundred linear feet on the lode.

The Act of 1872 preserves to the miner the rights acquired under the Act of 1866, and confers upon him additional rights. Under the Act of 1866, he could only hold one lode, or vein, although more than one appeared within the lines of his surface location. The surface ground was allowed him for the convenient working of the lode or vein located and for no other purpose; it conferred no right to any other lode or vein. But the Act of 1872 alters the law in this respect; it grants to him the exclusive right of possession to a quantity of surface ground not exceeding a specified amount, and not only to the particular lode or vein located, but to all other veins, lodes and ledges, the top or apex of which lies within the surface lines of his location, with the right to follow such veins, lodes or ledges to any depth. But these additional rights are granted subject to the limitation that in following the veins, lodes or ledges, the miner shall be confined to such portions thereof as lie between vertical planes drawn downward through the end lines of his location, and a further limitation upon his right in cases where two or more veins intersect or cross each other. The Act in terms annexes these conditions to the possession, not only of claims subsequently located, but to the possession of those previously located. This fact, taken in connection with the reservation of all rights acquired under the Act of 1866, indicates that, in the opinion of the Legislature, no change was made

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,

—ALSO—  
Hammered Iron of Every Description and Size.  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

## SHEET IRON PIPE.

## Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special  
patterns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

## PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

51 Fremont Street S. F.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

## TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other Drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,  
320 Sansome Street,

(Room 10.)

## The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE.  
EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND  
PRICE LIST.

When all others fail, buy a "Gardner." We have  
all sizes of these celebrated Steam Governors on hand  
at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—24 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....\$52 25

Cost of one ton.....2 61½

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further in-  
formation, apply to

D. J. O'HARRA,  
Reno, Nevada.

50 FINE CARDS, Damask, Repp, Etc., with name on  
13 cents. CLINTON BROS., Clintonville, Conn.

## Metallurgy and Ores.

## JOHN TAYLOR & CO.,

Importers of and Dealers in

ASSAYERS' MATERIALS,  
CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
etc., manufactured by the Patent Plumbago Crucible  
Co., of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.

Also, to our large and well adapted stock of

## Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.  
Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

## STRONG & CO.,

Assayers and Metallurgists,

10 STEVENSON STREET, S. F.

## HUNT, DOUGLAS & STEWART Process,

Used in Connection With PURVINE

## Wooden Amalgamating Pans and Settler.

This is a complete, perfect and economical adaptation  
of the humid method to the treatment of Gold or Silver  
ores, associated with

## COPPER

And other base metals, or to ores free from base metals.  
It can be adapted to any first-class Gold or Silver mill, at  
a reasonable additional expense.

For further information, address

J. O. STEWART,  
Georgetown, Colorado.

## To Ship and Engine Builders, Steam- ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.  
Address and references can be obtained at office of Sci-  
entific Press.

**TULLOCH'S AUTOMATIC ORE FEEDER,**

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Summer mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

Canadian Patents for U. S. Inventors and Patentees.

One Patent now Embraces all the English Provinces in North America, including the Canadas and British Columbia.

It is only recently that the Canadian Government has granted patents to United States citizens. In consequence hereof the many immensely valuable inventions patented in this country are now patented in Canada. Patents are much sought for and are readily disposed of at fair cash prices. In our country about three-fourths of all manufacturing is based upon patents, especially in the New England States no manufacturing business of any consequence is started without being protected by such. Our neighbors across the border have not been slow in observing and learning that inventions and patents are the foundation of all prosperity in manufacturing purposes. Hence all our patents for labor saving and agricultural machinery and innumerable improvements in home comforts meet a ready market in Canada. Inventors and Patentees should therefore not delay to secure their patents in Canada; many good inventions are already pirated by Canadians, who, against law and right, appropriate United States inventions and have them patented in their own name. After a patent is granted it is extremely difficult to prove who is the first and original inventor. Therefore, inventors and patentees to be safe, you will have to secure your patents in Canada without delay. We have facilities for securing Canadian patents second to none. Our charges for securing Canadian patents are about \$65. A model is required.

Inventors and patentees! do not delay and lose your opportunity. Things may change. With model and description of your invention remit \$25, and we will prepare all drawings and documents and forward them to you for signature. In about 30 to 50 days we can return your Canadian patent.

DEWEY & CO.,  
Patent Solicitors, S. F.

APPRECIATION ABROAD.—We copy the following from the Mining and Monetary Gazette, of London, England: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of The Gazette, the full text of the United States Mining Laws and Instructions, by the Commissioner of General Land Office, taken from our talented contemporary, THE MINING AND SCIENTIFIC PRESS, of San Francisco. The documents have now been issued in a handsomely bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very useful to those already interested in American mines, and to others who may be tempted to embark in that enterprise in the States."

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

## An Improved Concentrating Mill.

Joseph Richards, of Battle Mountain, Nev., has recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a novel combination and arrangement of devices for sizing, separating, settling and treating ore pulp, in order to concentrate and grade the particles of ore preparatory to subjecting them to the reducing process. The invention, therefore, resolves itself into a milling operation, the object of which is the mechanical separation of the different qualities and grades of ore, and the elimination, before final treatment, of the gangue, or worthless portion of the ore. To those who are waiting to be able to utilize low-grade galena and copper ores, this process will prove valuable.

A concentrating mill of this character has been in operation some little time at the Copper Canyon mines, Battle Mountain district. Mr. Richards, the inventor, is superintendent of the mines there belonging to the English company, and has been quite successful with this method of concentrating.

The ore is first passed through a Blake rock breaker, and from this it is still further reduced by passing between a pair of Cornish rolls with a stream of 10 inches of water. By referring to the accompanying engraving, the operation will be understood.

A, A, represent two sizing boxes, which are mounted at one end of the mill structure, and into which the pulp and tailings are delivered by suitable spouts. These boxes are placed loosely inside of guides, b, b, and each one rests upon a suitable platform. A stem, C, is arranged to project upward from each box, and on this stem is a tappet, d. A cam, E, is secured upon a horizontal shaft, F, above each box, in the proper position to strike the tappets and lift and drop the boxes, in the manner of operating stamps in a quartz mill. Inside of each box two or more inclined screens, g, g, are secured, one above the other, each alternate screen being inclined in an opposite direction. The fineness of these screens is graded from the top down. An opening is made in the sides of the boxes at the foot of each screen, and a chute, h, leads from each opening down to an elevated tank, I, which is mounted on legs on the floor below. By inclining each alternate screen in an opposite direction, one-half of the chutes and one-half of the tanks, I, will be on each side of the sizing boxes. The pulp, therefore, which falls into the sizing boxes, will be secured by the upper screens, so that only the coarsest portions will be delivered into the upper chute and pass into the outside tanks. The second screen will separate a second grade, and its chute will direct it into the tank on the opposite side; and so on down, separating the grains according to their size, until the very fine portion, which is known as "slimes," passes off through a spout, j, at the foot of each sizing box, which conducts them to a series of settling tanks, hereinafter described.

The pulp which accumulates in the elevated tanks, I, is occasionally drawn off into a car, K, and conveyed by it along a track, L, to the opposite end of the mill, where it is dumped, in equal proportions, into two spouts, m, m. These spouts deliver the pulp into the concentrator, which consists of three tanks, n, n<sup>1</sup> and n<sup>2</sup>.

Inside of this middle tank, n<sup>1</sup>, is a plunger, p, which is connected by a pitman, with a crank shaft above, so that it is kept in continual motion. The outside tanks, n, n<sup>2</sup>, are connected with the middle tank by an opening at or near their bottoms, and a gate, q, is arranged to regulate the size of these openings. The spouts, m, m, deliver the pulp into the outside boxes, n, n<sup>2</sup>, in each of which is placed a screen, i. A quantity of water is admitted into these tanks, so that the action of the plunger causes the pulp to be thoroughly washed and separated from any fine portion which might have found its way into the tanks. That portion of the pulp which remains above the screens, i, i, is occasionally skimmed off and carried back to the spout, j, where it is mixed with the slimes and is subsequently treated with them, while the portion which settles through the screens is drawn off

through the doors or gates, q, q, in a clean condition, ready for subsequent treatment. Two sets of these concentrators and washers are employed, one set being on each side of the mill, and each set serves to treat the pulp which is taken from one of the sizers. Usually the inventor constructs boxes, n, n<sup>2</sup>, with overflow spouts, which carry off the skimmings, and thus render the operation continuous.

The slimes, which, as above stated, pass off through the spouts, j, at the foot of each sizing box, together with the settlings and washings from the concentrators, n, n<sup>2</sup>, which have been added to them, are conveyed by a series of troughs to a tank, t, into the bottom of which a stream of water is delivered through a pipe u, which leads from an elevated reservoir, v.

This upward-directed stream of water dilutes the pulp, and by its upward action carries the lighter portion of the slimes over the lower edge of the tank and through a spout on into a series of settling tanks, X, X, X. The first

tion already mentioned (German and English). This process is most admirably adapted to the concentration of all galena ores (as well as copper, which is the ore treated here).

"This is, without doubt, the most perfect and successful method of concentrating ores to be found. Its success is due chiefly to this operation of sizing; and one great advantage it has over the dry process of concentration is, that the rich ore can escape in dust. Chlorides and bromides when crushed are usually very fine, and much of the dust escapes in the atmosphere. But here scarcely any portion of the minerals escapes. After concentration less than two per cent. of the ore remains in the slimes, and even this small loss is due more to the carelessness of the workmen than to the inability of the process to save it." (See biennial report of the State Mineralogist, State of Nevada, 1875-1876.)

The concentrating mill referred to is running successfully, as shown by the above, near Galena, Lander county, Nevada, in charge of Capt.

process, which concentrates it at one operation. The slimes are most effectually treated by a very unique operation, which separates all grit and mud when both can be treated by huddles, etc., which are very simple in operation. The process is known as the wet concentration process.

All who have low-grade ores to work, and can spare the time, should visit these works, and the gentlemanly Superintendent, Captain Richards, will take pleasure in explaining the operation. No one who has not seen it can form a good idea of this simple but effective operation. We are informed that the cost of concentrating is from one to two dollars per ton. Capt. Richards will furnish any further information concerning it to those applying to him at the address given above.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at this office in this city:

In the De Freres mine, owing to the sides of the main shaft slacking and being dangerous, the Superintendent has commenced timbering. No water has yet been encountered in the mine.

The flow of water in the Gould & Curry main incline compelled them to suspend work until another pump could be put in at the 1800-foot level.

At the Chollar mine for the week ending the 8th inst., 509 tons of ore were mined, assaying \$22.25 per ton.

In the Hussey Con. mine they have started stopes from the winze, 230-foot level, and they are producing and looking well.

The water in this New York mine increases somewhat as sinking progresses, but not enough to impede work.

The Justice upraise has developed a fine body of milling ore.

The new incline pumps of the Silver Hill draws the water from the incline shaft very effectually.

We see by the *Eureka Sentinel* that the Tybo Consolidated mine has been shut down for the present.

The Gila stopes are turning out a large quantity of high-grade ore, and looking better than at any time since the commencement of the work.

The rich ore in the north drift, new ledge, 230-foot level, of the Hussey, is from 15 to 20 inches wide. The whole face of the drift is in ledge matter, chiefly quartz, intermixed with pay ore.

Connection between the 600-foot level and winze of the Leopard, has been made, and the stopes, from the 600-foot level up, are being opened. The mill is running to full capacity.

The shaft house of the Grand Prize mine was burned on the 10th inst., but the new mill was not touched, or the machinery of the shaft injured.

**COPPER EXTRACTION AT SPENCEVILLE.**—In an article in the PRESS, of September 1st, copied from the *Nevada Gazette*, the introduction of the methods of copper extraction practiced at present at the Spenceville copper mine, Nevada county, is attributed to the credit of Mr. Borger, the present Superintendent. We are informed that the methods of roasting, leaching and precipitation in revolving cylinders are the same now at Spenceville as introduced and applied under the direction of Mr. G. F. Deetken, some years ago (although not approved by him, at present, as the best method, in the light of recent experience). This correction is due to Mr. Deetken, we not being aware of the incorrectness of the assertion when published.

On the 10th inst. the hoisting works of the Grand Prize mining company caught fire beneath the blacksmith shop, and the building was rapidly consumed. The wind was blowing from the west, directly away from the mill, which escaped. Loss about \$7,000.

THE verdict of the Coroner's jury, in the case of the man killed at the Savage mine, in Virginia, censures the two engineers and the faulty construction of the dial connected with the reel.

RICHARDS' IMPROVED CONCENTRATING MILL.

10 settling tanks have each a hole in its bottom, in which a tapering plug, y, is secured. Each plug has a stem, y<sup>1</sup>, extending upward and passing through a cross-piece which extends across the top of the tank, so that the conical plug can be removed or lowered as desired, in order to adjust the size of the opening according to the quantity of pulp it is required to draw off.

The stuff which passes through these holes is received in inclosed tanks, z, z, below, in which the particles will settle to the lowest part in a properly cleansed and concentrated condition, leaving the lighter portions on top. The heavier portions of the slimes delivered into the tank, t, by the spouts, j, will settle down through a hole in the bottom of the tank and be conducted to a spout, D, into a tank, E, from which it overflows into a tank, f, in a fit condition to be subjected to the reducing process.

This system of ore washing, concentrating and sizing apparatus is nearly automatic in its operation, so that the ore is put in proper condition for treatment at a slight expense.

Mr. R. W. Whitehill, the State Mineralogist of Nevada, who spent considerable time at the works and in the examination of this machinery, in concluding his report of this invention, says: "The ore in the slimes or fine pulp, which in all cases is the most difficult to treat, is manipulated in a very unique manner here, and here is where Captain Richards has made the improvements in the methods of concentra-

tion, the inventor, and also the inventor of the "automatic huddle," described in our last issue, which is also used there. The whole of the machinery is moved by a 12x24-inch steam engine, which is of sufficient capacity to move a larger number of jiggers. The mill, we believe, has a capacity of working from 30 to 40 tons per day. The mines are beyond a spur of the Battle Mountain range, a mile and a half south of Galena, and are owned and worked by an English company, of which Capt. Richards is Superintendent. The mill is about three miles from the mines, where there is a good supply of water. This whole arrangement is of new design, and has been found to be a perfect success.

This concentrating mill was erected and started to work in the latter end of June, 1876, and has been in successful operation ever since. The ores treated therein have been low-grade copper ore, from six per cent. upwards. This ore is usually manipulated so as to bring five or six tons into one. The ore, after concentration, assays 30%—sometimes more and sometimes less, according to the grade of the ore worked. The ores are first crushed in a Blake crusher, and then by Cornish rolls to from one-half inch to one-twelfth of an inch in size, depending on kind and quality of rock; any other size for any other kind of ores may be found more advantageous. After the ores are crushed, the largest portions are made to undergo a jiggling

## Lead Ores.

## The Mining Situation in Utah.

The Salt Lake *Tribune* publishes the following results of interviews with several prominent citizens in that city on the subject of the general condition and future prospects of Utah: Joseph R. Walker, of the firm of Walker Bros., was the first gentleman whom we addressed, and from whom we elicited the following response to our questions: One thing is certain, that lead ores are being produced at a loss, on account of the great depreciation in the price of lead, caused by producing more than is consumed. This is not influenced by local causes alone, but is almost universal. The great depression in business in the East has, in this connection, much to do with our lead productions here. This metal, which enters so largely into the production of paints, piping, etc., is now a drug on the market, as compared with former years; very little building is going on, and consequently the amount produced for this branch of industry is allowed to accumulate in the hands of the producer and lead merchant. The uses to which this product may be diverted are limited, and, consequently, as the amount is increased the value is depreciated. The remedy is plain and certain, so soon as a revival in business ensues. To continue to produce this article, which is so abundant in our Territory, there must, of course, be a reduction in the rates of transportation to distant markets. At the present high rates of freight it is impossible for mine-owners, owning lead-producing mines, to ship their ores to any market and make anything. He fears that the railroad officials will not discover this fact until it is too late; when the miners who are running on such close margins will be obliged to close up their properties. If once shut down, it would be very difficult to reopen and work them again without a considerable expenditure to replace the timber which will have rotted, and bring the machinery again into operation. He considers the business of the year 1877, so far, as not at all discouraging, which he thinks will average a fair year's business. The agricultural industry is decidedly encouraging. Taking everything into consideration, Mr. Walker deems the outlook for business very fair, and much more so when compared with the status of trade in most places throughout the country.

## John Tiernan,

One of the first men who has manipulated mining property in this Territory, appeared to take a contented view of the situation. He is at present working several lead-producing mines in Bingham canyon, and, although his profits arising therefrom are not as large as he would desire, yet, under the prevalent condition of business of every kind all over the country, he thought we were rather fortunate out here. Of course, Mr. Tiernan is of the opinion that if a material reduction in the rates of transportation of our mineral productions could be brought about, it would cut the Gordian knot of dull times, and men who are working their properties at a loss and who will be obliged to discontinue shortly, would be willing to work them on the closest margins in the hope of eventually bringing about a better state of things. He said that the railroad corporations, by their exorbitant demand for transportation of ores and bullion, are injuring this all-important industry and enriching themselves. On the question of miners' wages, he thought that "the workman was worthy of his hire," and that skilled miners were getting little enough for their work.

There are many properties that could be worked successfully at the present status of wages, but the trouble was with the common carriers. For his own part, however, he saw very little cause for discouragement, and announced himself as quite well satisfied with the future of the Territory and her mineral resources.

We next called upon the manager of the Ontario silver mining company,

## Mr. B. C. Chambers,

And found him busy at his office. After waiting a few moments, we introduced the object of our visit, whereupon he gave us his views as follows:

He stated that his duties were chiefly confined to the Ontario property in Park City, which was not a lead-producing mine, and consequently he had not felt the decline in that product in any material degree. Still this fact did not prevent him from watching the course of events on the lead question, which he considered gloomy indeed. If things continue as during the summer, he feared that within the space of two months two-thirds of the lead-producing mines will have to shut down. Mine owners have met him on the street daily and told him that unless a change for the better occurs within a very short time, they will be obliged to close up business. The Eastern lead market was gorged and the production far in excess of the demand. Although he himself was paying competent miners good wages, yet he considered that a great saving could be made by a general reduction of wages and a more stringent, economical administration over the workings of these mines.

He believed that a material reduction in the price of labor could be made without injury, and a corresponding benefit to the country would soon become manifest. Let the laborer as well as the mine owner economize, and the benefit would be mutual. In the East labor is abundant and the demand for it small. His company was paying good wages to its workmen, for three reasons; first, it has the best

workmen; second, though the mine was healthy, it was wet and uncomfortable to work in; and third, it could afford it, while the low grade mines cannot. A strict economy was necessary to secure our mining industries from destruction and place them upon a more satisfactory basis.

## Dr. A. K. Smith,

Whose interests in mining properties are chiefly confined to the Leeds district, in southern Utah, said that the lead question did not affect mine owners in this vicinity, as that article does not constitute a part of the ores mined there. There is not a mine developed to any extent but what pays. The policy is to pay workmen good wages on the theory that good work is deserving of good pay. So far as his observations extend with reference to the lead-producing camps, he feared that a general cessation of work will shortly occur unless some remedy is discovered. Even those men who produce and smelt their own ores must stop for a time, until a better market is afforded for the lead product and a general reduction made in transportation. He believed that Dry canyon was the only camp that could afford to continue to work under the present circumstances, on account of the high grade of its ores. The loss on the shipment of base bullion to Eastern markets is too great to continue, and even that of refined bullion, on account of exchange and percentage, is made at a loss of 13 per cent. The doctor, however, was hopeful of better times.

We concluded our rounds with a visit to

## Mr. Richard Mackintosh,

Who considered it would be a good thing for the country if the mines would shut down, for the Eastern market was already overstocked with lead, and it has continued in this state for the past two years. He believed the intrinsic value of mining properties was great as ever, and that they would eventually prove treasures to their owners, but at present the great object was to work off and utilize the surplus product, and then the country would be in a better condition to make use of further supplies. Did not think that the rate of wages paid to our miners was too little or too great, but was amply sufficient to provide for their own and their family's wants with a good degree of comfort. He certainly would not close down any of his mines, although at present he was working them without much profit. He was satisfied with the future outlook.

There were several other leading mining men that our reporter called upon several times during the day, but was unable to find them. If some means could be devised among the owners of the mines producing a low grade of ores, and who could work on close margins, to form some combination among themselves for the shipment of their ores and bullion, the railroads would soon be brought to terms. At present it seems hopeless to expect anything of a conciliatory character on the part of the railroad magnates.

## "Outside" Mines in Nevada.

The *Virginia Enterprise* says: The stocks of the prominent mines of eastern Nevada are strong, nowadays, and seem to be favorites in the market. We look upon this as a healthy sign. Since the bonanza was struck it has been the hardest thing in the world to get men of capital to consider the great claims which eastern Nevada has for consideration. If a mine less than 60 feet wide was mentioned they would turn up their noses and look, if they did not say, "What's the use of bothering about a little thing like that!" The result has been hard on eastern Nevada, and very many of the men who, with a few thousand dollars, have confined themselves to Comstock stock speculations have lost their all, when, had they invested their money on some of the reasonable showings which have from time to time been made upon outside mines, they might have been happy now. By this we do not mean to cast discredit on the Comstock. It seems to us that about the cheapest mining stock stocks in the world today are those of the bonanza mines. But we would be glad if we could say something which would cause mining men to be fair to all mines. There are not many bonanzas in the world, but there are a great many small mines which, with prudent management, will yield as much money as any half dozen men ought to have. This State is full of such properties. In almost every district there are such mines. Bodie is a sample. It was worked years ago, imperfectly, and fell into disrepute. Last year a gentleman was in this city with a map of the district; he explained what had been done, and why the former trials were failures; and tried, in vain, to find some one with a little capital to investigate the matter, see if he was right, and, if so, to help put the district on its feet by the expenditure of a little money. For such expenditure he offered the lion's share of his interests. He could not get an encouraging word, much less any help. But this year two or three resolute men undertook to give Bodie a trial, and now Bodie looms up the coming camp; and, before this day a year, men here will pay for a few hundred shares of Bodie stock more than a whole mine would have cost them last summer. Tuscarora is another camp which, as a rule, mining men have ignored. When Grand Prize had one mill running and a second and larger mill nearly completed, with abundance of ore for both already developed, men here could not be persuaded to buy the stock at \$3 and \$5. Last evening it touched \$19, with an upward tendency. Another claim there which three months ago was for sale at \$15,000, is now sell-

ing at the rate of seven times that sum, and the stock is a first-rate buy, if the words of honest men and good miners can be relied upon. Three or four months ago Dr. Webber and two or three other gentlemen quietly bought a mine in Esmeralda county, and, building a five-stamp mill, have gone to work to make out of the ground a fortune. The promise now is that within a year they will get for their investment \$20 for one. Ike Bateman and his partners owned the Northern Belle for several years before any extensive work was done upon it. They tried to sell it for \$35,000. At last Mr. Bateman incorporated it, and sought to sell stock enough to build a mill. He tried for weeks in vain, until W. C. Ralston at last took it, more as an accommodation to Bateman than with a hope of gain. Since then the mine has not missed a dividend of \$50,000 per month for 26 months, amounting to \$1,300,000, with a prospect of continuing the same yield indefinitely. These examples show what can be done. White Pine, Elko, Nye and Humboldt counties are full of undeveloped mines. We believe the Pyramid district, in Washoe county, only awaits the application of a little pluck and money to make it a place where thousands of miners will find profitable employment. Some time, in this or the next generation, people will begin to realize something of the magnitude of the mining resources of Nevada.

## The Mining Situation in Arizona.

A correspondent of the *Arizona Enterprise*, writing from Alexandria, gives the following concerning the mining situation in Arizona:

Since I wrote you last I have made an extended trip through the mines of this section, and am free to confess that in no country have I seen such flattering prospects. The mines here, generally, are undeveloped, the deepest shaft in the district being only 300 feet, but so far as they are sunk upon they show finely. The owners are mostly poor men, who lack the means to open their claims, the want of reduction works being the great drawback to the mining interests of the country. Ore that will not go \$500 per ton will not pay to ship to San Francisco; and when freight, wharfage, storage and many other exactions which the owner has to submit to from the ring who control the purchase of ores, is added, but a very light margin is left for the hard-working miner.

It would naturally be expected that those men who have made money here, and whose every interest is linked with the destiny of the Territory, would lend a helping hand to the struggling miner in his efforts to develop the only real wealth of the country; the reverse is the case, however. To this there are one or two honorable exceptions. Coming here in early days, nearly all of them penniless, by taking advantage of exorbitant prices, and some of them of the follies and vices of their fellow-men, these enterprising (?) and thrifty citizens have gathered in a considerable quantity of the filthy lucre. The Government patronage in the shape of contracts, etc., was another rich lead which these patriotic and "truly loil" souls were not slow to take advantage of, and which they worked for all it was worth.

The men of broken fortunes, and those who never had any to break, who, under the assumed title of mining capitalists, have inflicted their presence on this community, have been another obstacle in the path of Arizona's advancement. Possessing neither cash nor credit, not overburdened with either honesty or honor, these specious gentry came here possessed with the idea that the owners of mines are ready to give away the fruits of years of danger and toil to the first smooth-tongued fraud who may ask for them. Several mines have been handed by these worthless, who, "by ways that are dark and tricks that are vain," have tried hard to follow honest Iago's advice to simple Rodrigo, sometimes at the expense of the owners; but thus far, though they have visited, examined and tested many mines in this part of Arizona, and made a devil of a pother generally, their immediate capital remains securely locked up in the vaults of California street, and they have yet to invest the first dollar in the mines of Yavapai county.

It is a fact that cannot be gainsayed, that mining at the best is somewhat risky—from its nature it cannot be otherwise. Mining sharps on this coast, however, are not disposed to take any risks. If a miner has a piece of property which is opened and shows beyond the possibility of doubt that there is \$50,000 in sight, then your California speculator (?), in the largeness of his heart, might be tempted to offer \$25,000 for it. This plan, it must be admitted, is a safe and sure one for the man of means, but it is hardly doing justice to the poor miner or prospector. I hardly think that many sales will be made on this basis.

The developments thus far made here have been accomplished by the persistent energy of the citizens of the Territory, and in this connection may be mentioned the Peck mining company, who, starting without means, have opened one of the finest mines on the coast. They are now busily at work preparing for the erection of a 10-stamp mill, which will open a new era of prosperity for the mines in this vicinity.

The town where I write from is the outgrowth of this mine, and already contains several stores, restaurants, boarding-house, etc., not forgetting numerous saloons. Arizonans, as far as my experience goes, are thirsty souls, which is owing, I suppose, to the dryness of the climate. All round about this region the sound of the

prospector's pick echoes from mountain and canyon, and this part of Arizona is being thoroughly explored. I have met here men who have prospected the coast from Cariboo to Chili. "The slings and arrows of outrageous fortune" have left their marks on many of them, and not a few are on the shady side of life, but they are still as light-hearted and buoyant as when they first began. Hope still repeats her flattering tale. Their sanguine spirits are proof against every disaster and disappointment, and when well primed with a generous quantity of the fiery fluid (here, by courtesy, called whisky), fortune smiles upon them; the rainbow hues of hope are brilliant with golden gleams, and they are still sanguine of "striking it." In nearly every instance, however, the original discoverer reaps but slight benefit from his find. Marshall, who found the first gold in California, a discovery which has in a manner revolutionized the globe, has had to earn a precarious existence by repeating the tale of the wonderful find throughout the cities of the Union; and the parsimony of a California Legislature refused him even a pittance in his old age. Comstock, the finder of the famous ledge that bears his name, which has added over \$300,000,000 to the solid wealth of the world, ended his days in privation and poverty, and not even a simple head-board marks the last resting place of the greatest of prospectors.

As I mentioned in my last, there is here a fine opening for men of means desirous of investing in mines. Ready cash, which most of the operators from the West are without, will accomplish much. Many very fine properties can be had at low figures; and, from the temper of the people, I am satisfied that the introduction of Eastern capital will be cordially welcomed, and every inducement offered for its successful investment. California operators generally handle mines for speculative purposes. This fact is well understood here, and the people are desirous of seeing the mining interests of the country in the hands of bona fide workers.

I repeat the time is ripe. The people are tired of the oppressions of the railroad monopoly and the exactions of the San Francisco ring, and will gladly welcome relief from any quarter. Once secure the mining interests, and the trade of the country will follow. It is a prize worth striking for. The Eastern people command the situation; it remains to be seen whether they will take advantage of it.

In regard to your inquiries as to the agricultural resources of this country, I will say that the lack of water will prevent Arizona from becoming much of a farming country. There are some good valleys in the southern part of the Territory, where fair crops are raised by irrigation; but the uncertainty of rains makes the calling of the Granger in this section a hard road to travel indeed. The future of Arizona depends on her mining interests. This is the corner-stone of her power and prosperity; everything else is secondary.

## Ward's Leading Mine.

The *Ward Reflex* says: There has been so much sameness about the work going on in the Paymaster, of late, that we have not thought it worth noticing. The work of taking out ore in the clay chamber has been suspended for the present, the ground being so soft that it was deemed advisable to timber it up securely before taking out any more ore. Sufficient ore is now coming out of the mine to keep six water-jacket furnaces running; but, unfortunately, the company has but two, and, we suppose, at two it will remain until sometime next summer. The company, it would seem, much prefer to pay the debt now hanging over it by levying assessments than to take it out of the mine. It suits the stockholders better, and, then again, some time between now and the close of the nineteenth century, they may begin to think of dividends. All that is necessary is to patiently wait. There is enough ore in sight to pay all debts five times over, but then it would be a pity to reduce it. Furnaces would be required and, possibly, mills. If the mill was started up, several thousand dollars would have to be invested in paus, and, possibly, it would take a week to get even on that outlay after it was started up. It takes money to run a mine, and that is one of the worst features; yes, and a mining man thrown in. The owners of the Consolidated Virginia or California would feel comfortable if a like body of ore, of equal richness, was exposed to view in either of those mines, and every effort would be put forth to take it out; but here it would be an impossibility to arouse the management from an ordinary snooze. A dividend of a million a month would be no inducement to wake up. Beyond question the Paymaster is the equal of any mine known or unknown, but sometime during the present year it is just possible to work out all above the second tunnel, which is all of 150 feet below the surface; and what sane man would think of going deeper, unless it were by a tunnel that would intersect the vein fully 100 feet deeper, even though it were necessary to run it 2,000 feet in order to reach that stupendous depth—a thing the mind of man is hardly able to grasp. The Paymaster has no equal in the State, in richness, at least, and is but little, if any, inferior to the Comstock in width; is, in fact, a wonderful mine, but is the worst worked mine the world ever saw. The manner in which it is worked is no less wonderful than the mine itself.

## MECHANICAL PROGRESS.

## The Value of Dry Steam.

J. Haug, a mechanical engineer, writes for the *Polytechnic Review* some points on the loss and danger of priming in boilers, and some ways of guarding against it. He says: The use of dry steam is not only a source of economy in this boiler, to prevent an unnecessary expenditure of heat, but still more so in the engine, where water contained in the steam not only does no work, but cools the metal in the steam cylinder, etc., thereby causing a fresh expenditure of steam to heat these parts up again. If with every pound of steam at 60 lbs. pressure a half pound of water is carried over, a quantity not unusual in a priming boiler, the latter has to be heated to the boiling point, and 7% of the heat is expended in heating the water carried over. The feed pump has, of course, 50% more work to do, and the heater will have its efficiency reduced by one-third.

"To avoid priming, a boiler should have a good circulation, and be large enough to do its work without forced firing. A good circulation will also improve the evaporative efficiency of a boiler, as the steam (which is a bad conductor of heat) is quickly removed from the heated plates, and now water constantly follows it.

A steam trap, either fixed in a steam dome, or in some high place in the steam pipe, will drain the water trapped in it back to the boiler, thus saving heat expended in heating it. Sometimes the steam pipe is extended downward from the throttle valve on the engine, so as to form a *cul de sac* for the accumulation of water, which can then be pumped back into the boiler. A superheater, heated by the waste gases, may serve to evaporate the water carried over, and to dry the steam thoroughly; but if the priming is excessive, it will not be sufficient for this purpose.

If water is carried into the cylinder, it will cool the metal, with which it comes in contact; the amount of this depends upon the surface exposed, the difference of initial and final temperature, the specific heat of the metal, the piston speed, the rate of expansion, etc.; and the variable character of these conditions makes it exceedingly difficult to give a figure for the loss thus incurred, but it is certainly considerable, and may range up to 30%.

In non-expansive engines this water is partly evaporated on the back stroke, abstracting heat from the cylinder increasing the back pressure, and in a condensing engine requiring more injection water and entailing more work upon the air pump. In expansive engines the re-evaporation of this water takes place during expansion, whereby the final pressure is somewhat increased, but this is vastly overbalanced by a great fall in the initial pressure; for engines using 60 pounds of steam, cutting off at one-sixth or one-eighth, the initial pressure on the indicator card may often be 20 to 30 pounds below the boiler pressure. Even a steam jacket would be powerless against a great influx of water, as its surface and rate of conduction are necessarily limited. Last, but not least, the danger of water in the cylinder must be considered, the result generally being broken pistons and rods, knocked-out cylinder heads, and, as a natural consequence, a general smash-up.

## Propelling by Pumps.

Attempts have been made at various times to move boats by forcing jets of water through openings in the sides or ends of the hulls, and hitherto these experiments have not been successful. A more recent experiment in this direction has resulted favorably, and a tow-boat, 13.11 meters (43 feet) long, has been constructed that employs a common steam pump in place of an engine and propeller. A writer in *Scribner's Monthly* gives the following details: The boat has a steam boiler of moderate size, and is, in other respects, one tow-boat of the usual pattern. Four pipes, 64 millimeters ( $2\frac{1}{2}$  inches) in diameter, are laid the whole length of the boat inside, and about a meter below the water line. At the bow two of these pipes open the whole size of the pipe directly into the outer water, and at the stern they are reduced to a nozzle of only 22 millimeters diameter. The other pair of pipes are arranged in the same manner, except that the nozzles are placed at the bows. A steam pump is connected with each pair of these pipes, and when at work takes the water in at the bows and ejects it in a powerful stream at the stern, and thus forces the boat ahead at a good speed. To reverse the direction, the pump takes the water from the stern through the other pair of pipes and forces it out at the bow, and the boat instantly reverses its direction. The novelty in this invention consists in the use of a reduced pipe or nozzle at the place of discharge. By means of the two nozzles the boat may be easily steered independently of the rudder by using one or the other of the two pipes alternately. The advantages claimed for this system of propulsion are the cheapness of the apparatus and the absence of ripple or disturbance of the water. The escaping water is so far below the surface that it creates no disturbance, and the boat only

makes the wave that breaks from the bow, and, in this respect, this method of propulsion may fulfill the demand for a steam tow-boat for canals. On a trial trip at sea, the boat made a voyage of some length in safety and at good speed.

## Pistons which Require no Lubrication.

In describing a form of compound engines for working steam of very high pressure, Mr. Loftus Perkins, in a paper read before the Institution of Mechanical Engineers, explained that he found some difficulty in getting ordinary pistons and valves to stand the high temperatures, or, to use his own language:

"In working these high pressures (350 lbs. per square inch) with great expansion, the ordinary mode of packing the pistons was found unsatisfactory, and to overcome the difficulty the compound piston was devised. The prevalent scoring and cutting of engine cylinders was effectively remedied by the discovery of the compound metal, of which the packing rings are made, which requires no lubricating material. Many cylinders fitted with piston rings made of this metal have been several years at work, and have been often examined, the cylinders showing no signs of wear, the wear taking place on the rings only, which may be easily and inexpensively renewed as required; and experience has proved that, with these pistons, the longer an engine is worked the more perfect does the surface of the cylinders become, and the less wear results to the packing rings. This metal for piston-packing rings is composed of five parts tin and 15 parts copper, and has since been used by several other makers for ordinary engines with great success. When this metal is used, no oil or grease is required to lubricate the cylinders—a great advantage, particularly when the engines are fitted with surface condensers."

Of one engine the writer says: "After being in use nearly 13 years, the piston-packing and valve rings, made of the special metal, were found in excellent condition after 18 months' working without lubrication since last examined."

## Our Domestic Metals.

Professor Thurston makes the following points in the *Popular Science Monthly*:

"This country has for years been importing cast iron, while domestic products of equal and even greater intrinsic value sell at a lower price. Other similar instances of unwisdom are cited by Professor Thurston, as, for example, the fact that we are importing boiler-plate at 11 cents a pound, when we can purchase American steel, vastly superior in all respects for the special purposes to which the former article is applied, at eight cents. Again, we import vast quantities of foreign steel tools, when at Pittsburgh and elsewhere we make steel fully its equal. In New England and Pennsylvania we have ores from which is made the finest cast-iron ordnance in the world. In Ohio we make a metal for car-wheels such as is never seen in Europe, and of such tenacity and elasticity that foreign engineers listen incredulously when it is described. Our Lake Champlain ores make an iron fully equal to Swedish for conversion into steel; and around Lake Superior and in Missouri we have deposits from which comes Bessemer metal, far superior to the phosphorus-charged metal we import. New Jersey supplies us with zinc which meets with no competition as a pure metal, and which can be used without purification, even for chemical purposes; and our native copper is absolutely free from admixture with injurious elements. It is time that these facts should be known, and that the people should disabuse their minds of the idea that, because a commodity is 'imported,' it is therefore of greater intrinsic value than a domestic product."

**BLASTING COAL WITH COMPRESSED AIR.**—With a view to facilitate the getting of coal without the use of gunpowder, Mr. Samuel Marsh, of Nottingham, proposes the use of compressed air in cartridges placed in direct connection with pumps, the pressure in such cartridges being increased until the explosion takes place. He also has a portable exploder, charged with compressed atmospheric air by the same machinery, which is then taken and connected to the cartridge. The cartridge, which is composed of iron or steel, in the form of a cylinder, is securely rammed or stemmed in; and when connected to the exploder the valve is opened, and the admission of air bursts the cartridge and brings down the coal. After the blasting operation is finished the exploder is unscrewed, and ready to be charged again.

**TOUGHENING GLASS BY COMPRESSION.**—In the Siemens' glass works at Dresden, there is now manufactured a product which has the same properties as La Bastie's tempered glass, the strength being communicated by the pressure of metallic rolls. Plates can be made, by this method, of much larger dimensions than by La Bastie's. They have a beautiful look, and can be ornamented with the most complicated designs, at a less cost than ordinary glass. Siemens claims that glass manufactured by his process has a greater strength than tempered glass, in the ratio of five to three. When broken it shows a fibrous structure, while La Bastie's is crystalline.

## SCIENTIFIC PROGRESS.

## Geological Progress.

We learn from a foreign exchange that MM. Delesse and de Lapparent have prepared a valuable resume of the geological works published during the years 1875 and 1876. Their work covers 184 closely-printed pages; we have room only for a few brief notes. The mean height of Europe, according to Leipoldt, is 296,838 meters; Humboldt's estimate was 205m. The increase of temperature at given depths below the surface, is greatest in the equatorial regions. Prestwich has confirmed the views of Dana, Carpenter and Wyville-Thomson, relative to the distribution of ocean temperatures. The resistance of rocks to crushing is diminished (in some cases as much as 80 per cent.) by the absorption of water. The plasticity of surface rocks is intimately dependent on their argillaceous character; but at great depths, pressure, water and increased temperature, make all rocks plastic. Th. Hubener has demonstrated, in a lignite, the existence of a multitude of microscopic quartz crystals, which he attributes to a slow decomposition of infiltrated silicates by the humic acid. By treating a Vesuvian pumice, which seemed to be amorphous, with fluorhydric acid, Fonque has extracted from it crystals of feldspar, pyroxene, amphibole, peridot, magnesian mica, and oxidized iron. He has also shown that the minute cavities of the pumice were decked with microscopic crystals of amorphous. The contest respecting the organic character of the *Eozoon* still continues; and even if its animal origin is granted, doubts are thrown on the assumed age of the Laurentian formation, in which it is found. Owen has studied the bones of a curious carnivorous reptile, *Cynodrakon major*, from southern Africa. He assigns it, together with other similar reptiles from the same region, to a new order, *Theoriodontes*, having the dentition of carnivores. He thinks that their high organization cannot be explained by the hypotheses either of Darwin or Lamarck. Forests improve the soil much more rapidly than coppice-wood; the humus exhibits a very different composition from that of the rocks upon the surface of which it is formed. Experiments with Treseca's apparatus seem to show that cleavage and lamination may be due to the same cause, and that the schistosity of gneiss may be no evidence of stratification.

## Insects' Breathing Apparatus.

In a recent work on the morphology of the tracheal or respiratory system of insects, reviewed by the *New York Independent*, Dr. J. A. Palmen arrives at the conclusion that the primitive number of pairs of spiracles or breathing holes in insects is eleven, thus agreeing with the views previously expressed by Packard in a brief essay published on the subject in 1873. Palmen's work comprises 150 pages, and is quite exhaustive, as a German essay should be. He believes that the tracheal system was at first, in its primitive form, open—i. e., consisting of a series of tubes connected by spiracles or holes with the outer world. In certain aquatic insects the system became closed, the larva breathing by external gill-like appendages. As to the origin of the tracheae Butschli (1870) believed that their mode of origin was the same as the silk glands, and that the two sets of organs were homologous, and that they were derived primitively from the segmental organs of worms, which are arranged in pairs along the body of the latter animal. In 1873 Packard suggested that the air-tubes may have originated independently within the body, and afterward formed a connection with minute pores leading through the skin. In 1874 Semper expressed the same views as those of Butschli, which in the year after was accepted by Mayer. Moseley regarded them in 1874 as dermal glands modified. Packard then suggested that the tracheal system might be derived from the water vascular system of certain low worms; while, in a late paper on the development of the Lepidoptera, Hantschke conceives that the air-tubes are derived from respiratory portions of the skin much enlarged. Finally Palmen appears to adopt the view that the tracheae may have originated from the segmental organs from the jointed worms. This shows how conjectural is our knowledge of the origin of these interesting organs. He conceives that the excretory function of the primitive lung-sac was afterward replaced by an absorbing function, and the sac or tube became a respiratory organ—viz., a trachea—which (at first simple and sac-like, due originally to an impushing of the skin) became longer and branched, until it assumed the present form. With this view we should not be disposed to find fault as a provisional hypothesis.

**COLORS OF MARS.**—In the observations about to be made of Mars at the time of its opposition, which occurs in this month, Professor Proctor thinks that it will be a favorable opportunity for a more careful study of the varieties of light and shade and of color in this planet. In comparing pictures of the same object made by different observers, great difference is apparent, and can be traced to this cause. The notion that the surface is divided into ruddy and green portions, and the white polar crown cape and occasional white cloud markings, is far from the truth.

## Why Mars' Moons were not Found Before.

Prof. Simon Newcomb writes to the *New York Tribune* in answer to the above question as follows: The answer is that Mars is now nearer to the earth than it has been at any time since 1845, when the great telescopes of the present had hardly begun to be known. The next opportunity for seeing them occurred in 1862, but we may suppose they were then not especially sought for with the two or three telescopes which alone would show them. The next favorable opposition was in 1875, but Mars was then so far south of the equator that it could not well be observed in our latitudes. The present opposition is about the best possible for observation in the middle latitude of our hemispheres, because the very smallest deviation from greatest possible approach to the earth arises from the opposition occurring a few days after the planet reaches its position, and this throws it farther north in declination than it would be at the time of absolutely nearest approach. The next opposition will occur in October, 1879, and there is some hope that the satellites may then again be observed with the Washington telescope. During the 10 years following they will probably be entirely invisible with all the telescopes of the world, because, owing to the great eccentricity of the orbit of Mars, the planet will be too far away at the times of opposition. In 1892 a favorable opposition will again occur. During the present year it is hardly likely that the satellites will be visible after October.

**A NEW METAL.**—Serge Kern announces, in *Comptes Rendus*, his discovery, in June last, of a new platinum metal which he calls *davyum*, in honor of Sir Humphrey Davy. It is hard, silvery in luster, malleable at red heat, readily soluble in aqua-regia and very feebly in boiling sulphuric acid, yielding a yellow precipitate with caustic potash. Sulphureted hydrogen, passed through a dilute solution of the chloride, yields a brown precipitate which becomes black upon drying. Potassic sulphocyanide, with the same solution, is colored red; and if the solution of *davyum* in KCyS is concentrated, a red precipitate is obtained. Sp. gr. 9.385 at 25° C. Kern thinks that in Mendeleeff's proposed classification of the elements, *davyum* is the hypothetical element placed between molybdenum and ruthenium, in which case its equivalent should be 100. It would then rank as the second confirmation of Mendeleeff's predictions, gallium having been the first. It is probably rare. The platinumiferous sand does not contain more than .00045 of *davyum*.

**THE HAYDEN SURVEYS.**—A telegram from Washington gives the following interesting information: James Stevenson, executive officer of Prof. Hayden's geological survey, has just returned from the field of exploration. Stevenson says that several divisions of the expedition are still at work and approaching the completion of their labor for the season. Each division has ten thousand square miles assigned it for examination, and reports just received from the seats of divisions indicate that they will finish their field work by the first of October. The result of this year's examinations will be equal in importance to that of any previous year. The work of survey in the present year will be in the Territories of Idaho, Wyoming, and Montana.

**A TELESCOPE IDLE.**—The mammoth telescope completed some two years ago by Alvan Clark & Son, of Cambridge, for L. J. McCormick, of Virginia, the reaping-machine manufacturer, still lies in the factory. This instrument has an object-glass of 26 inches, is nearly 20 feet in length, and was made for \$38,000 in gold. A portion of the cost only has been paid by Mr. McCormick; and the reason that he has never taken the instrument is said to be that he is unable to decide to which of the observatories and colleges that have begged for it he will give it. It is also understood that Mr. McCormick is in hopes of receiving a legacy to assist in paying for the telescope. In all probability, if the instrument is ever taken, it will be donated to some institution in Virginia, says the *Boston Transcript*.

**SANITAS.**—The oxidation product of turpentine (analogous, it is said, to the principle of the famous *Eucalyptus globulus*) discovered by Messrs. Kingzett and Ziegler, is now manufactured on a large scale for use as an antiseptic and disinfectant, under the name of *sanitas*. For proofs of its usefulness, says *Iron*, in these capacities readers may refer to the experiment detailed in the paper read by Mr. Kingzett before the Society of Arts. We have seen several instances of arrested putrefaction effected by means of *sanitas*, and intend further testing it. A variety of it is made for toilet purposes, and appears to be deserving of trial.

**GALVANIC CRYSTALLIZATION.**—The journal of the Russian Chemical and Physical Society, says *Nature*, contains observations, by Shidlovsky, on the microscopical crystallization of various metals under the influence of a galvanic current. The dendritic agglomerations of crystals form very speedily; their branches spread out from the cathode to the anode plate, vibrate on reaching it and collapse; this process is repeated till the space between the plates is filled with a spongy metallic mass. Each crystal has a characteristic ramification. The crystallization does not appear when the anode is gold or platinum.

THE connection between the Ophir and Sierra Nevada mines was made on the 7th inst., giving improved ventilation and increased facilities for drifting and prospecting. It is considered by miners as one of the most important connections made during the past year.

# THE ENGINEER.

## Allowing for Rail Expansion.

This is a point in practical railway building which, we see, was quite thoroughly discussed at the late meeting of the Master Mechanics Association. In a paper by W. S. Huntington, the following table is introduced:

Length of rails, ft.	No. joints in a mile, one side of track.	Space for expansion, inch.	Fractions of an inch, decimally expressed.
15.....	352	.1026	1-84... .01562
16.....	330	.1090	1-32... .03125
18.....	293	.1228	1-16... .0625
20.....	264	.1363	1-8... .1250
21.....	251	.1434	3-16... .1875
28.....	183	.1914	1-4... .2500
30.....	176	.2044	5-16... .3125
36.....	146	.2465	3-8... .3750
40.....	132	.2725	7-16... .4375
			1... .1.0000

Among the reasons why it is best to be particular to have the rails the right distance apart at the joints are: If there is not room enough for expansion, the rails will tend to the form of a loop, causing death and destruction. And even if the compression is not sufficient to cause this, the effect on the track is destructive and causes breakages. If you are "out on the track" in a hot day, and the rails are "uncomfortably tight," and no trains in sight, you will be warned by the approach of one by the groaning and laboring of the track, as though it were a thing of life, and undergoing the most excruciating torture, or laboring like a ship in a storm at sea. The train may be two or three miles off, and out of sight, but you know it is coming by the snapping and cracking of the joints, as now and then a rail finds a little space and is thrust against its neighbor like a blow from a sledge. With this excessive compression on the rails and fish-bars, and the heavy rolling weight they are subjected to, the rails are strained and worked like a piece of tin bent back and forth between the thumb and fingers; and if there is a flaw or a weak spot it will soon amount to a crack and then break.

If the joints are left open considerably more than is necessary, the rails are soon spoiled and unnecessary expense incurred. And again, if more space is allowed for expansion than is necessary for very hot weather, that space added to that made by contraction in severe cold weather makes a considerable unnecessary space, which greatly shortens the life of the rails and fixtures. A track with the right space at the joints is worth much more than if laid hap-hazard.

## Improvements in Shutter Dams

Some recent improvements in France of shutter dams, worked by hydraulic pressure, have attracted much attention among engineers, the system comprising—first, a series of great wooden water gates, movable around a horizontal axis working in a cast-iron shoe secured to the floor of the dam; second, hydraulic presses applied on the down river side of the floor solidly anchored in the masonry and designed to work the gates—the piston of each press bearing a cast-iron cross-head working in slides, to which cross-head three rods are attached for communicating the pressure to a cross-bar fastened in the center of the movable gate; third, a series of copper tubes which puts each press in communication with the generator or reservoir of power destined to transmit water under the pressure of the hydraulic presses; and fourth, hydraulic works built on the abutment of the dam—these comprising a turbine with a vertical axis, a double force pump which receives motion from the turbine, and a reservoir of force. The pumps and the reservoir communicate with each other and with the presses by means of three-way cocks, which let the water either into the reservoir or into the presses, or empty it into a discharging tube. The maneuvering of the gates is effected by simply moving these cocks. By putting in communication each press either with the pumps or with the reservoir of power under a sufficient pressure, an ascending motion of the piston is effected, and in consequence the gate rises. By opening the cock into the waste pipe the water escapes under pressure of the gate, the "corps de presse" is emptied, and the gate sinks. The reservoir force is a regulator of the play of the pumps, and also permits the dam to be raised sufficiently, in case of need, to put the turbine in motion.

A FRENCH IRRIGATION SCHEME.—An important work of irrigation is in course of execution in the Department of Drome. The necessary legal concession for the prosecution of the undertaking was obtained on May 21st, 1874, and the works are now being vigorously pushed forward. The canal takes its origin from the Bourne, at a point about 200 meters below Pont-en-Royans, and is intended to supply water at the rate of seven cubic meters per second for the irrigation of 17,500 acres of land. It will consist of a principal canal in connection with a number of secondary channels carrying water to land in 24 different communes; and in case of need can be made to draw its supplies from two

further sources, one in the Lyonne and the other in its tributary, the Cholet. The Minister of Public Works has granted a subvention of 2,900,000 francs towards the expenses of the scheme, two-thirds of which sum is to be laid out upon the construction of the principal canal, while the remainder may be employed upon the secondary and tertiary branches. The works are progressing at such a rate that it is expected the principal channel will be completed considerably within the five years allowed for its construction, and it has become necessary to present a petition to the Chambers asking for the payment of the subvention before the date at which it was originally supposed the money would be first required.

NOT THE FAULT OF THE ENGINEER.—An Eastern exchange says: Destructive tornadoes occur in our Western States with sufficient frequency to be regarded as somewhat characteristic of certain regions. High table-lands in the interior of continents are more exposed to

## The Mole at Vera Cruz.

One of the interesting things about the construction of the new Mexican railway is the mole at Vera Cruz, by which connection is made between cars and shipboard. We read that the mole is built of iron, its length is 725 feet and its breadth is 60 feet at the end which stands in the sea. There are three tracks on the mole along the cranes, used for loading and discharging on the launches. The tracks then unite in one, connecting the mole with the station buildings, which are about 300 feet distant. The whole structure is divided into spans of 30 feet. The number of wrought-iron girders, including cross girders, is 150, resting on 76 cast-iron columns, driven into the rocky ground at a depth of 10 to 13½ feet. As the larger vessels cannot reach the pier, the company possesses two steam tugboats and five launches for their loading and unloading.

GREAT AMERICAN SHRIKE.

violence from winds than any other portions of the temperate zones. Of the extreme fury and strength of a tornado no conception can be formed by persons who have never seen its work. Against its power, if fully displayed, no structure of human hands can stand for an instant. There need be no surprise that the bridge over the Missouri at Omaha was torn to pieces when struck squarely by a tornado, nor does the fact reflect any discredit upon the bridge as a piece of engineering. Fortunately, visitations of this sort are comparatively unknown to dwellers this side of the Alleghenies, since the ranges of mountains back of the Atlantic coast check the violence of winds that sweep over the interior of the continent.

SAND IN SUEZ'S MOUTH.—It is estimated that the coast at the mouth of the Suez canal, at Port Said, is advancing outward at the rapid rate of about 50 yards per annum, and that the necessity for extensive dredging will be greater year by year. Not less than 937,000 cubic yards of deposit had to be removed in 1875, while the dredging of 161,000 cubic yards sufficed in 1871. The British government has ordered a new survey of the coast between Port Said and the Damietta mouth of the Nile, in order to ascertain the actual condition and the rate of increase of the sandbanks, and to see if any plan besides dredging can be adopted to check the growth of the obstruction.

There are five cranes placed at the extremity of the mole, four small ones for raising two tons each, and a larger central one which raises a weight of 20 tons. They are moved by a hydraulic apparatus of modern construction, in a perfect state of safety and order. The total weight of iron employed in the mole is 553.13 tons.

HUDSON RIVER TUNNEL.—It is the intention of the Tunnel Company, says the *Iron Age*, to begin work early in the coming fall. A shaft 25 feet deep has been dug at the foot of Fifteenth street, Jersey City, and this depth will be increased 20 feet. From this as a starting point, the tunnel will proceed in a northeasterly direction under the Hudson river and the Christopher street ferry slip. The entrance on the New York side will be in the neighborhood of Washington square. From Jersey City the grade will descend two feet in every 100 feet, until a point 2,700 feet from the New York side is reached, when it will begin to ascend at the rate of one foot in every 100 feet. The tunnel will be two miles in length, with a road-bed 23 feet wide, and two separate tracks. Through its entire length it will be lighted with gas. The wall will be constructed of brick, with a thickness of four feet. At no point will the top of the tunnel be less than 35 feet below the surface of the water, and in many places it will be 70 feet below. 120 laborers will be engaged in the

construction of the tunnel. The work will go on during the whole of the 24 hours, the force working in three relays, for eight hours each. Although the tunnel will be used for the conveyance of passengers, its main object will be the transportation of freight to and from the great railroad lines which terminate in Jersey City. The capital of the company is \$10,000,000.

## The Shrike, or Butcher Bird.

Our engraving shows a style of bird which many readers will recognize for it, or an allied species which is very common on this coast. It is the shrike, the terror of singing birds and of insects. The scientific name of the species shown in the engraving is *Lanius excubitor*, according to Wilson and Audubon. They build their nests in covered and secluded spots. These nests are often found on shrubs not above 10 feet from the ground, and generally in a fork at the top. They are as large as those of robins, and are composed externally of coarse grass, leaves, and moss, and internally of fibrous roots, over which feathers are placed. The eggs are four or five in number, of a dull cinerous tint, thickly spotted and streaked with light-brown towards the larger end. The period of incubation is 15 days. The young, so unlike their parents for a time, remain along with them, sometimes, indeed, even during the first winter. Caterpillars, spiders, and insects of various kinds form their first food, together with small fruits; but, as they grow up, their parents bring them the flesh of small birds, on which they feed greedily even before they leave the nest.

Possessing the faculty of imitating the notes of the sparrows and other birds, especially their cries of distress, they are believed to allure birds of these species and then seize upon them. One of them will alight upon its prey, strike it on the back of the head, which it thus breaks open, and, if not interfered with, will tear up the body, and swallow it in large pieces, with many of the feathers upon it. This shrike often pursues a turtle-dove or other bird a long distance on the wing, and eventually, by a single blow, cause it to fall to the ground. It is always active, courageous and persevering; and in winter, when insects and small birds are scarce in the Eastern States, at times it enters the cities, and attacks birds in cages, even flying through the open doors and windows in the pursuit. When caught with the hand, it pierces its little claws into the flesh and bites with considerable tenacity until choked off.

The flight of this bird is strong, swift and sustained, but not very elevated, being simply over the tops of low bushes. Impaling insects and birds on thorns is among its acts of cruelty; a habit it pursues without apparent motive, though some believe its design in this is to attract small birds to the spot, that it may seize and prey upon them. In this State it delights in impaling the large mole crickets, sometimes on the sharp points left by the pruning knife. We are told, also, of a case where six mice, alive and kicking, were transixed upon the sharp spines which surmount the leaves of the agave.

## Cornucopia District.

A correspondent of the *Silver State*, writing from Cornucopia says:

The mining prospects of this section are brightening every day. At Mountain City they have a 10-stamp mill running steadily, and, within the last week or 10 days, have shipped three bars of bullion, and have several more ready for shipment. This bullion comes from ore taken from the Mountain Laurel mine. Over in the Bull Run country, the Infidel mine, which I have mentioned before, is under the management of Mr. Meacham, and is developing well. I cannot give particulars, but I heard Meacham say, the other day, that in a short time he would have a splendid mine developed. Just north of town the Ruby Consolidated (Sullivan & Co's. claim) is being worked steadily. They are now down 60 feet and are drifting north on the ledge, getting very fine mineral. The ledge at this depth is about five feet in width, over half of it carrying ore that assays not less than \$260 per ton, and from that up to more than \$800 per ton. It is sufficiently developed to demonstrate that it is going to be the equal of any mine in this district or Tuscarora. The Panther company are now preparing to put up their hoisting works. Teams have gone after the machinery, and will have it on the ground in a few days, when the works will be erected as soon as possible.

The Hussey, during the last few days, on the 220-foot level, has been showing herself in her richest plumage. In her good humor she has presented her expectant owners with a solid and well-defined ledge two and one-half feet thick, which, on an average assay of the ore taken out across the ledge, and without any assorting, went \$269.36 cents per ton, and there is an immense amount of such ore. It is no small body, and men that have examined it say that it will excel the Leopard in its brightest days. Of the latter company's present works and prospects I cannot tell much, but there is an apparent move for the better somewhere in or about the mine—they are paying more promptly and putting on an increased force daily. In fact, all the leading mines now worked in the camp are largely augmenting their forces. No laboring man need be idle in this camp long if he is on the work. You can see that prospects are looking up here by the stock indicator. Cornucopia stocks are all on the raise. This place will be all right yet. |

## Tuscarora District.

We had the pleasure of meeting, says the Gold Hill News, with T. E. Atkinson, one of the principal owners and managers of the famous De Fries mill and mining company, at Tuscarora. Mr. Atkinson has just returned from a visit to that lively mining locality, where he has attended to the interests of his company, and he speaks very highly of the prospects and prosperity of the district and its mines. The Grand Prize is the leading mine, and is yielding splendidly at the present time. As compared with the Comstock, the vein is a mere stringer or feeder of a dozen feet or so in width, but the whole of it is very rich silver ore, which at or below the water level is of the white, free-milling Comstock character, such as comprises the richest portions of the bonanzas. At the 400-foot level, recently opened, the vein is eight feet wide and the whole of it from wall to wall is of the richest description. The mills are now running on ore from this mine, and turning out heavy shipments of bullion. Dividends will commence shortly.

The De Fries adjoins the Grand Prize on the same ledge, and without a doubt will soon be as prosperous a condition. The company have a new 14-stamp mill now in operation, and propose adding 10 stamps more, the whole to be run by water power, flowing from a living spring. This furnishes 150 miners' inches of water, even in the driest portion of the year, with an obtainable fall of 200 feet if desired, thus giving all the power and milling facilities required. Steam hoisting works are erected over the mine, and the shaft is down 215 feet, or to the third level of the mine. A fourth level will be opened, 100 feet deeper. In the first level, 40 feet below the surface, the ledge was found to be only two feet wide; at the second level, 113 feet below the surface, it was six feet wide, and on the third, or present lowest working level, it is 10 feet wide. This ledge has proven to be richer in proportion as depth and width have been attained, assaying at the second level as high as \$528 per ton. Very little, however, has been done as yet in the way of stopping and breasting out the ore, about 1,500 tons in all having been extracted thus far in opening out the mine. This, without assorting, will probably average nearly or quite \$30 to the ton, and go much higher by assorting. To crush this ore at their water mill will cost \$10 per ton, including hauling (seven miles), for which \$2.50 per ton is charged. The water power of the company is called worth \$50,000. With this water power they have 320 acres of land.

The Navajo, Young America, Independence and Hornet are among the most prominent of the neighboring mines. The Navajo company are down 85 feet, and have a ledge four feet in width. The ore is very rich in born silver, chlorides and bromides. The Young America ledge is small, only about two feet in width, but is rich in gold, gold predominating in the ore. The Independence company have let a contract for the erection of a 10-stamp steam mill. They have not yet attained any considerable depth on their lead. The Hornet company have a good ledge, but also have a great deal of water to contend with at present. This water, however, comes from the surface, and they will presently have no trouble with it. At the depth of 215 feet the De Fries company have no water.

The various ledges upon which these companies are located do not run parallel with each other, but seem to concentrate toward the center of the steep hill to the northward, beneath whose high peak might be the grand reservoir or fountain head of them all. The owners of these ledges and mining claims all feel rich, and everybody looks forward to a prosperous future.

## Bullionville.

The editor of the Pioche Record has been on a trip to Bullionville, and says it now has the appearance of a pretty lively camp, although a small one. The limited number of business men that are there express themselves as well pleased with their present business and the future prospects of the place. The Raymond & Ely 30-stamp mill had the 18 pans and eight settlers all at work on tailings, the ore cars being so constructed as to run down into the tailing pit, load up and return with a supply of the tailings for the pans. The supply seems to be inexhaustible. The tailings are worked with much more satisfaction now than on the first start, the bullion also being of a much finer quality. The blacksmith and repair shop of this company is particularly occupied in fixing ore cars and other paraphernalia about the mill. The concentration works of Hugh White were in full blast, doing good work and concentrating many tons of tailings during the day. The concentrations are very heavy, giving evidence of considerable metal. A visit to the smelting furnace disclosed the fact that it was not then running, but the large amount of charcoal, iron ore and tin cans gathered around, showed that every preparation was being made for an early start. The Alps, or American Flag mill, was going to its full capacity, under the charge of John Collier, five stamps being about to run on custom ore. Several parties having custom ore at the mill for crushing, were waiting anxiously their proper turn to take battery samples. Ore at the Raymond & Ely mill is accumulating rapidly, preparatory to starting the batteries on it. The 20-stamp mill is at present engaged in pumping up water for the mill, etc.

## USEFUL INFORMATION.

## The Average Height of Men.

The Druggists' Circular, in noticing the questionable statement "that we are becoming a degenerate race," discusses the tables prepared by Dr. Baxter from the records of the Provost Marshal General's Bureau, made during the civil war. These examinations were made during the latter part of the war, after the finest fighting material had been enlisted, consequently these statistics do not overestimate the average development of the American people. From the tables of Dr. Baxter and those of Mr. Gould, gathered by the Sanitary Commission, the Indians are shown to be a tall race. In the comparison of States the Indians would rank as high as the ninth, though it is curious to see that they head the list of nationalities.

Here follows the table showing the superiority in stature of 501,068 men of the various nationalities—185,448 foreigners, three-fifths of whom were from Germany and Ireland—the former having a few thousand more than the latter:

NATION.	MEAN HEIGHT IN INCHES.	NATION.	MEAN HEIGHT IN INCHES.
1. U. S., Indians.....	67.931	14. Wales.....	68.418
2. U. S., Whites.....	67.672	15. Russia.....	68.393
3. Norway.....	67.465	16. Switzerland.....	68.381
4. Scotland.....	67.060	17. West Indies.....	66.307
5. British America.....	67.014	18. France.....	66.271
6. Sweden.....	66.896	19. Poland.....	66.211
7. Ireland.....	66.741	20. Mexico.....	66.110
8. Denmark.....	66.648	21. Italy.....	66.000
9. Holland.....	66.637	22. South America.....	65.839
10. Hungary.....	66.584	23. Spain.....	65.823
11. England.....	66.577	24. Portugal.....	65.432
12. Germany.....	66.539		
13. U. S., Colored.....	66.531	Mean of total.....	67.300

Graded according to the mean stature of the inhabitants (American born whites), the different Northern States stand as follows:

NATION.	MEAN HEIGHT IN INCHES.	NATION.	MEAN HEIGHT IN INCHES.
1. Kentucky.....	68.077	14. Maryland.....	67.814
2. Kansas.....	68.551	15. Ohio.....	67.833
3. Minnesota.....	68.371	16. Vermont.....	67.833
4. Missouri.....	68.337	17. Delaware.....	67.490
5. California.....	68.307	18. Pennsylvania.....	67.430
6. Nevada.....	68.286	19. Dist. of Columbia.....	67.353

13. Michigan.....	67.826		
		Mean of total.....	67.672

## Lace Paper.

The manufacture of what is called lace papers is an important branch of trade in Germany, and even in these times of general depression has maintained its activity. The uses of these papers are exceedingly various; it is the general custom in Germany to decorate ceilings, fireplaces and the like with them, while confectioneries, bouquets, etc., are put in gay-colored wrappers.

The great difficulty in manufacturing these papers, says the *Paper Trade Journal*, is to produce a surface which will exhibit, as in real lace, the fine gradations of lines. Small lead hammers are used for punching on stamps. The holes and edges of the desired pattern are raised on the stamp, and the paper being laid on it is hammered until the hollow surfaces project on the other side.

The paper must be uniform in strength and sizing, and also in color, or it will appear as if composed of different kinds. As it frequently happens that the edges of the sheets are not equally pressed, care is taken to avoid any folds or creases in the middle. From two to four sheets are stamped at a time, and unless they have been rubbed with talc they must be closely pressed together. Some manufacturers have the stamping done in penal institutions, but the advantages of this, if any, are not very apparent. The appearance of this paper is very much improved when the sheets are pressed, the impression being much clearer, but for most purposes this is not usual. For bouquets card paper must be used, and the center replaced by pasting a piece of glazed card so as to form the funnel; but previously a cross must be cut out of the center so as to admit the stem of the bouquet. Some of these bouquet-holders have from 12 to 24 plys, and are made in imitation of ferns, etc. There are some 50 manufacturers of these *papiers de luxe* in Berlin, and they are now introducing them for various ornamental purposes—as borders to chromo-lithographs, etc., and bringing them out in colors.

ROOFING STREETS AND COOLING HOUSES.—The *Celestial Empire*, published in Shanghai, China, offers some suggestions, says the *Iron Age*, that might be of value on this side of the globe, as the temperature which calls forth the remarks is not higher than that of most American cities in midsummer. The Chinese practice of roofing their streets in hot weather with a temporary covering of matting is spoken of in terms of high approval. Streets thus shaded are said to furnish a most agreeable arcade. It is further suggested that the air beneath the matting might advantageously be kept in motion by out-door punkahs. Indoors there are plenty of inventions for warming houses, but very few for cooling them. What a delightful convenience it would be, for instance, to be able, by merely turning the button of a register, to let a cool wind pour into a room at any moment! Must we wait till the next generation introduces the latest improvements before we can have both hot and cold air, as well as hot and cold water in our houses?

GALVANIZING IRON.—Molesworth gives the following directions for galvanizing iron—coating iron with zinc. The directions are very explicit and will be found valuable by many of our readers who have, from time to time, asked questions in regard to this kind of work. Pickle the article six or eight hours in water containing about one per cent. of sulphuric acid, held in wooden vessels; the acid requires to be renewed from time to time, according to the quantity of iron pickled. After pickling scour and wash well in clean water. Keep the article under clean water (in which a little fresh burnt lime has been stirred) until ready for the next process. Immerse in chloride of zinc for one or two minutes until a skin of fine bubbles is formed on the surface. Chloride of zinc may be formed by saturating hydrochloric acid with metallic zinc until effervescence ceases, then decanting and adding a little sal-ammoniac. Dry the article on a heated iron plate, then immerse it in a bath of molten (not glowing) zinc until it acquires the temperature of the zinc bath. The surface of the molten zinc should be protected by sal-ammoniac, or some other substance. In some cases there is a partition at the surface of the bath, one portion of the surface being protected with sal-ammoniac, the other with a layer of charcoal. Beat the article while hot, to remove the excess of zinc.

ADULTERATION OF BEESWAX.—The recent adulteration of yellow beeswax with resin has led to the invention of a new method for its detection. E. Schmidt recommends the following process for the rapid and accurate detection of relatively small quantities of pine resin. He heats five grammes (75 grains) of the wax to be tested in a flask with four or five times the quantity of crude nitric acid, specific gravity 1.31 to 1.33, until it boils; and it is kept boiling a minute, then an equal volume of cold water is added, and enough ammonia (which must be added very cautiously) put in and shaken to cause it to smell strongly of ammonia. The alkaline liquid is decanted from the precipitated wax into a cylindrical vessel. If the wax is pure the liquid will have a yellow color; if the wax is adulterated with resin, the liquid will have a more or less intensely reddish-brown color from the formation of nitro-products. This being a colorimetric test, it is well to have some perfectly pure wax for comparison. The reaction is much more violent during boiling if resin is present. As little as one per cent. can be detected in this way.

WATERPROOF LEATHER.—Melt one liter of boiled linseed oil, 125 grammes of suet, 46 grammes wax, and 32 grammes resin together over a slow fire, and apply it to the leather with a brush while warm. This composition keeps the leather very soft. The English fishermen have long been using it. They can remain in the water for hours ere it penetrates through the leather.

BLAST FURNACES IN THE UNITED STATES.—A statement compiled by the *Iron Age*, reports that there are 704 blast furnaces in the United States, of which 270 burn charcoal, 208 bituminous coal or coke and 226 anthracite coal. Of these, 87 charcoal, 85 soft coal and 87 anthracite furnaces, 259 in all, are in blast, leaving 445 idle.

EBURITE.—A new material called eburite, apparently capable of extensive employment in the arts, is made in this way: To the dust of bone or ivory, gum tragacanth and any suitable coloring matter are added. The whole is then pressed. Sometimes a very intimate union is formed between the particles of bone or ivory by heat and pressure without any gum.

## GOOD HEALTH.

## Hints on the Care of the Eyes.

There are, perhaps, more individuals who ascribe their weakness of sight to a use of their eyes under an insufficient artificial illumination than to any one other cause. In a great many instances this may not be strictly true, but there can be no doubt that faulty artificial light is one of the most productive causes of a certain class of injuries to which the eye can be exposed. The two sources of trouble with the ordinary artificial lights are—first, they are not pure white, and secondly, they are unsteady. The first defect is found in all artificial lights except the lime, electric and magnesium lights; the second especially in candles and gas. The yellowness is, in a measure, counteracted by using, in the case of lamps and gas, chimneys of a violet or blue tint, and the flickering of the gas may be obviated largely by employing an Argand burner. All things considered, a German student-lamp furnishes the most satisfactory light. The next best is gas with an Argand burner. The chimneys of both may, as above suggested, be advantageously of a light-blue tint.

The position of the light in relation to the body is of great importance. If a shade is used on the lamp or burner (it should, by preference, be of ground or "milk" glass, never of colored glass), the light may stand directly in front of the body and the work be allowed to lie in the light under the shade, which will protect the eyes from the glare of the flame. If no shade is used the back should be turned to the source of light, which ought to fall over the left shoulder.

The same rule applies in the management of daylight. In this case the light should come from behind and slightly above, and fall directly on the work, whence it is reflected to the eye. It should never fall directly in the face.

The light in the room during sleep is also not without its influence. As a rule, the room during sleeping hours should be dark; and, in particular, care should be taken to avoid sleeping opposite a window where, on opening the eyes in the morning, a flood of strong light will fall on them. Even the strongest eyes are, after the repose of the night, more or less sensitive to the impression of intense light. The eyes must have time to accustom themselves to the stimulus.

Attention should be called to the injurious effects that follow reading on railroad cars. On account of the unsteadiness of the page, reading, under these circumstances, is exceedingly trying to the eyes, and should never be persisted in for any considerable length of time. During convalescence from severe illness the eyes are generally the last to regain their lost power.—*Dr. S. M. Burnett, in Scribner.*

## Pickles Colored but not Poisoned.

Picklemakers have for a long time had to fight their consciences by "greening" their product by heating in copper vessels, or by introducing copper salts. The French chemists claim to have done away with the use of copper by substituting a preparation of chlorophyll, which is the substance forming the natural green in plants. The matter was brought before the Academy of Sciences in Paris, recently, and a paper read, the purpose of which was to establish the fact that the salts of copper can be advantageously replaced in all particulars by the exclusive employment of chlorophyll obtained from edible vegetables—a conclusion which is based upon the following observations, which we obtain through the *Polytechnic Review*:

1. The chlorophyll of the vegetables disappears during ebullition.

2. The vegetable fiber and the starchy matter which is contained, when brought in contact with chlorophyll during ebullition, almost completely saturate themselves.

3. The vegetables when but half saturated with chlorophyll during the operation of bleaching retain this beautiful coloring matter.

These facts are of great importance, and indicate the mode of procedure which is to be adopted. If some spinach, or still better, the foliage of leguminous plants be treated with caustic soda, a liquor is obtained which gives, with alum, a lac of chlorophyll. This lac should be carefully washed to free it from sulphate of soda. This lac is easily dissolved by means of an alkaline phosphate or alkaline earth, and is composed of chlorophyll, alumina and phosphate of soda. This dissolved lac is added to the bleaching water, and on ebullition yields up its chlorophyll to the vegetables. Several flasks of peas prepared by this process were presented to the Academy; of these, those that were completely saturated with chlorophyll possessed a shade of color impossible to be obtained by the use of copper; besides, they were devoid of the astringent taste, as well as the poisonous effect, which characterizes those preserved by means of the salts of that metal.

Although the application of the French discovery, as described above, can be made only by one skilled in the handling of chemicals, there can be no doubt that ere long so important a matter will be put forth in more popular form.

## Healthful Hours.

When the days are hot and the nights cool, says *Hall's Journal*, there are periods of time within each 24 hours when it is safest to be indoors, with doors and windows closed—that is to say, for the hour or two including sunrise and sunset—because about sunset the air cools, and the vapors, which the heats of the day have caused to ascend far above us, condense and settle near the surface of the earth, so as to be breathed by the inhabitants. As the night grows colder these vapors sink lower and are within a foot or two of the earth, so they are not breathed. As the sun rises, these same vapors are warmed and begin to ascend, to be breathed again; but, as the air becomes warmer, they are carried so far above our heads as to become innocuous. Thus it is that the old citizens of Charleston, S. C., remember that, while it was considered important to live in the country during the summer, the common observation of the people originated the custom of riding into town, not in the cool of the evening or of the morning, but in the middle of the day. They did not understand the philosophy, but they observed the fact that those who came to the city at midday remained well, while those who did so early or late suffered from it.

All strangers at Rome are cautioned not to cross the Pontine marshes after the heat of the day is over. Sixteen of a ship's crew, touching at one of the West India islands, slept on shore several nights, and 13 of them died of yellow fever in a few days; while of 250, who were freely ashore during the day, not a single case of illness occurred. The marshes above named are crossed in six or eight hours, and many travelers who do it in the night are attacked with mortal fevers. This does at first sight seem to indicate that night air is unwholesome, at least in the locality of virulent malaria; but there is no direct proof that the air above sunrise and sunset is not that which is productive of the mischief.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—An Improved Concentrating Mill; Items of Interest from the Mines, 161. The Week; Tailings; Notices of Recent Patents; The Bullion Tax; Another Dry Placer Machine, 168. The Sierra Plume and Lumber Company; A Pocket Laboratory for Prospectors, 169. Patents and Inventions; Our Own Exhibit; Points of Success, 172.

**ILLUSTRATIONS.**—Richards' Improved Concentrating Mill, 161. Great American Shrike, 166. Yard and Works of the Sierra Plume and Lumber Company, 169.

**MECHANICAL PROGRESS.**—The Value of Dry Steam; Propelling by Pumps; Pistons which require no Lubrication; Our Domestic Metals; Blasting Coal with Compressed Air; Toughening Glass by Compression, 163.

**SCIENTIFIC PROGRESS.**—Geological Progress; Insects' Breathing Apparatus; Why Mars' Moons were not Found Before; A New Metal; The Hayden Surveys; A Telescope Idle; Sanitas; Galvanic Crystallization, 163.

**THE ENGINEER.**—Allowing for Rail Expansion; Improvements in Shuttle Dams; A French Irrigation Scheme; Not the Fault of the Engineer; Sand in Suez's Mouth; The Mole at Vera Cruz; Hudson River Tunnel, 166.

**MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 164.

**MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Idaho and Utah, 165-172.

**USEFUL INFORMATION.**—The Average Height of Men; Luce Paper; Roofing Streets and Cooling Houses; Galvanizing Iron; Adulteration of Beeswax; Waterproof Leather; Blast Furnaces in the United States; Eburiite, 167.

**GOOD HEALTH.**—Hints on the Care of the Eyes; Fickles Colored but not Poisoned; Healthful Hours, 167.

**GENERAL NEWS ITEMS** on page 172 and other pages.

**MISCELLANEOUS.**—Lead Ores; "Outside" Mines in Nevada; The Mining Situation in Arizona; Ward's Leading Mine, 162. The Shrike, or Butcher Bird; Cornucopia District, 166. Tuscarora District; Bullionville, 167. The Gravel Channels of Iowa Hill; Working Flute Dust; Fire Proof Construction; Mineral Hill; A Sweet Remedy; Our Paper Mills; The Ridge, 170.

## NEW ADVERTISEMENTS.

Wren's Petroleum Gas Works, W. C. Wren, Brooklyn, N. Y.; Position Wanted, Chemist, New York City; Tulloch's Automatic Ore Feeder, Fred' Ogden, S. F.; Assessment Notice—Excelsior Silver Mining Co.

## The Week.

The week has brought forward nothing of special importance in connection with the mining interests. The Sutro tunnel, as it gradually nears the Comstock lode, is a subject of considerable discussion. It is expected that there will be some difficulty in effecting an arrangement to suit both the tunnel people and the owners of the mines, as far as the royalty is concerned. A committee of mine owners has the matter under consideration, however, and the result will soon be made known.

The week brings to us the opening of the fair season in the interior. The Mechanics' Institute fair in this city has proved such a complete success, and the demand of the populace is so clear, that it will be continued through another week. This, however, will not interfere with the reign of the State fair at Sacramento, which will be inaugurated with due ceremonies next Monday. Indeed, we shall not be surprised if this contemporaneous existence of the two fairs will prove an accommodation to many visitors up and down the coast for they can visit the Mechanics' fair on their way to or from Sacramento, and thus enjoy the two exhibitions by one absence from home. As we have said from time to time, on the authority of the Sacramento papers, the prospect for this State fair is bright, and we trust no one there present may have the least cause to remember that the present is a dry year.

The failure of Frank Leslie, the newspaper publisher, is announced. Liabilities, \$330,000.

## Tailings.

Peoples have found out, within the past few years, that it is sometimes more profitable to work over tailings which have been hurriedly or carelessly put through the mills, than it was to work a mine and mill the ore as it came from the mine. The tailings, after lying exposed to the weather for a year or more, are much more easily worked, as the sulphurets decompose and the mass becomes much more tractable. A good creek or gulch full of tailings is now often worth more than the original mine, and people have made fortunes working these beds.

Near the Comstock there are several tailings mills at work. At first they did pretty well, but when quicksilver went up so high, they had to give up for a while. Now the tailings mill, at the junction of the Seven-Mile and Six-Mile cauyons, is running night and day on the tailings and slum from the bonanza mills in Virginia City. Employment is given to between 75 and 100 men. The Gold Hill News describes the process as follows: The slum has to be thoroughly dried before working. During the summer months it is spread out upon the ground and exposed to the sun for several weeks. It has to be turned and handled a number of times before it is ready for the mill. This requires a great deal of labor. When winter comes, with its snows and rains, the sun-drying process is not available, and were not some other means adopted, the supply of workable slum would soon be exhausted, and work at the mill would necessarily close for the season. To obviate such a step, a drying machine has been constructed at the Union foundry, and is now being placed in position at this mill. It is a home invention, and the inventor thinks it will have capacity enough to keep this mill in active operation. It has not yet been put to a practical test. If it is found to do its work readily and well, as is expected, it will be used winter and summer, as the cost of fuel to run the dryer would be but a trifle compared with the money it takes to employ men and teams to haul and handle the slum by the out-door method. The mill has a crushing capacity of over 200 tons per day. The slum is worth about \$30 per ton, enough to make this working of the mill quite profitable.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**SPRING FLOOR.**—Wm. H. Clark, Austin, Nev. This invention relates to a spring floor, which can be formed on a solid foundation in such a manner as not to affect the standing walls of a building. It consists of a supplemental floor, placed over either an ordinary floor or the beams upon which floors are usually secured, having springs beneath the supplemental floor, which are so arranged that an even elasticity will be given to all parts of the floor. This floor is claimed to be safe and durable. If desired, the spring floor may cover only a portion of a room, a stationary platform being built up even with it so that a level surface will be presented, the stationary part being used for seats, music stand or any desired purpose.

**DEVICE FOR HOLDING SACKS FOR FILLING.**—J. L. Covert, Modesto, Stanislaus county. This is a novel device for holding sacks when being filled, the construction being such that any sized sack can be instantly adjusted when empty and released when full. Mr. Covert has employed in practice 10 of the holders, side by side, and having a tilting spout between them, by which they could be alternately used.

MR. E. M. DENNY will visit Oregon and adjacent Territories in the interests of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, and will correspond for both papers. We have noticed Mr. Denny's correspondence in the Tulare county papers, and are sure that the notes he gathers will be of interest to our readers. We hope our friends in the regions he visits will assist Mr. Denny as much as they can, and show him such favors as are in their power.

THE County Commissioners of Storey county signed a contract with Lewis & Deal and Jonas Selsky to act as their attorneys to prosecute the back bullion tax suits, for the recovery of taxes due Storey county from 1868 to 1875 inclusive, amounting to about a million dollars. According to a dispatch published in one of the morning papers, the prosecuting lawyers are to receive from Storey county a 20% fee.

THE mint, at the request of the Treasury Commission, commenced to run, Thursday morning, at its maximum capacity for one week, excepting the refinery. The necessary amount of refined bullion has been procured to keep the mint in active operation, and the consumption of coal during the next two weeks will be carefully noted by Mr. Eckert, who has been selected for that purpose by the Commission.

By a collision between two vessels in the English channel, this week, 96 lives were lost.

## The Bullion Tax.

The Decision of the U. S. Supreme Court that it is Valid.

The suit of Charles Forbes, appellant, vs. Thomas Gracy et al. (appeal from the Circuit Court of the United States for the District of Nevada), has been decided by the United States Supreme Court. This was a suit brought by the appellant to enjoin the Collector of Taxes of Storey county, Nevada, from collecting the tax imposed by the law of that State upon the property of the Consolidated Virginia mining company, appellant being a stockholder in that company and an alien, a subject of the Queen of Great Britain. The tax is imposed upon the proceeds of a mine worked by a corporation, and is resisted on the ground that the title to the land from which the mineral is taken is in the United States, and is not, for that reason, liable to State taxation. The case, says the judge delivering the opinion, is prepared and submitted to the United States in printed argument in the very last days of the term, and we are urged to decide it on the ground that it involves a question of vast interest to all mining operations in the Pacific States, and is of vital importance to the State of Nevada, as it affects

## Her Largest Source of Revenue.

In view of its importance, then, we should postpone a decision until the next term, if the questions presented were over-doubtful or difficult of solution. We think very few words—all we can give to this subject at this late day—will show that it is neither. It is very true that Congress has, by her statutes and tacit consent, permitted individuals and corporations to take out and convert to their own use ores containing precious metals which are found in lands belonging to the Government without exacting or receiving any compensation for these ores, or without requiring a mine to buy or pay for the land. It has gone further, and recognized the possessory rights of these miners, as ascertained among themselves by rules which have become the laws of mining districts as regards mining claims; but in adding this it has not parted with title to the land, except in cases where the land has been sold in accordance with the provisions of this law on that subject. If the tax of the State of Nevada is, in point of fact, levied on this property right of the United States, we are bound by our previous decisions and by sound principles to hold that it is void. If, on the other hand, it is levied upon the property of the miner, and may be collected without affecting or embarrassing the title of the United States to property which belongs to that Government, then there is no ground for interference with the process of the State in its collection. A few extracts from the statutes of Nevada showing the nature and character of the property on which the contested tax is imposed, and the manner of its enforcement and collection, will enable us to decide whether it belongs to one or the other of these classes. We copy here important sections of the Act of February 28th, 1871, imposing this tax. After quoting so much of the law as is necessary to its proper construction, we find that under it, where ore is detached from its bed it becomes personal property, free from any lien of the Government and subject to taxation. It does not seem to us that there can be any reasonable ground for asserting that the United States has any interest in the tax or in the sale of property for said tax. It is, however, urged with more show of reason that section six, which makes this tax a lien on the mines or mining claims from which ores or minerals bearing gold or silver are extracted for reduction, is an interference with the right of the property of the Government. An examination of the language we have quoted will show that it was carefully prepared to avoid this objection, and we think it does. The use of the words "mines or mining claims" is evidently intended to distinguish between cases in which the miner is the owner of the soil, and therefore has a perfect title to the mine, and those in which the miner does not have title to the soil, but works the mine under what is well known in mining districts, and what is, as we have said, recognized by an Act of Congress, as mining claims. In this first case the statutes make a lien on the mine, because the title to the mine is in the person who owns it, and should pay tax. In the other tax is a lien only on the claim of the mine; that is,

## On His Possessory Right

To explore and work the mine under the existing laws and regulations on the subject. In the former case, of course, the United States has no interest to be protected, and the State is at liberty to declare and enforce such lien for her taxes. In the latter case, such rights as the mining laws allow and as Congress concedes to develop and work the mines are properly in the miner. That it is so shown is clear by the conduct of mining corporations in whose interest this suit is brought, which, for the purpose of evading this tax, permits its investment in this mine (said to be worth from \$50,000,000 to \$100,000,000) to rest on this claim, this mere possessory right, when it could, at a ridiculously small sum compared to the value of the mine, obtain the Government's title to the entire land, soil, mineral and all. These claims are subject to bargain and sale, and constitute very largely the wealth of the Pacific coast States. They are property in the fullest sense of the word, and their ownership, transfer and use are governed

by the well-defined basis of this law, and are recognized by the States and Federal Government. This claim may be sold, transferred, mortgaged or inherited without infringing the title of the United States. Why may it not also be subjected to a lien for taxes, and the claim, such as it is, recognized by the statute, be sold to enforce the lien? We see nothing in principle or in any interest which the United States has in the land to prevent it. We are of opinion that the decree of the Circuit Court dismissing the bill of the appellant on a demurrer was right, and it is therefore affirmed. Justice Field, being disqualified by reason of interest, took no part in the decision of this case. Justice Miller delivered the opinion.

## Another Dry Placer Machine.

A short time since we published a description of a machine for working dry placers, which was in operation in New Mexico. Considerable inquiry has been made concerning these machines, as there are plenty of places in this State, as well as in Western Nevada and Arizona, where ground not now available could be made to yield profitable returns, if the machine is all that is claimed for it. We notice that another machine of its kind has come to the front, which has been experimented with by Messrs. Duhem & Bennet, of Denver, Colorado, for some time.

A few weeks since they made their first public test, with results which, though not pecuniarily large, were satisfactory to the parties interested. The Denver Times describes the apparatus as follows:

"The machine, which is portable, being mounted on wheels, weighs about 4,000 pounds, exclusive of an eight-horse power engine and hoiler required to run it, is placed upon a mine in the South Park, about 10 miles east from Hamilton, and one mile south of Terray creek. This mine was chosen more as a test than for any hope of profit, it being an abandoned mine, and the gold being extremely fine. On this mine can be had nearly all kinds of dirt, from black bottom clay and mud to the ordinary gravel deposit, and, in fact, for a thorough and severe test no better spot could have been selected. Two experienced miners, working here with the sluice, cleaned up a little less than \$6, for their joint labor for six days. At the end of a six-day run, during which much non-pay dirt was put through (it being necessary to handle the latter in searching for this pay streak), the machine cleaned up \$99.94, as stamped by the Denver mint. And when it is taken into consideration that the 60 odd square feet of copper surface was new and rough, with a number of riveted seams, and that they were not cleaned with a view to taking all the gold, it will be evident that as much more was saved. The necessary expense of running is from \$10 to \$12 per day, and this will decrease as experience is gained; but taking the highest figure of expense, and leaving out of consideration the gold saved and absorbed (so to speak) by the 60 feet of surface, the mint assay shows a clear profit to the machine of \$25 for the first six days' run. Experienced mill men have estimated the gold saved and still on the plates at from \$75 to \$100, and it is fully believed that the next week's run will not fall short of \$300, which will leave a net profit of \$225 to the machine, and this on a mine where 50 cents per day to the man cannot be had with the sluice.

"During the six days all kinds of dirt were put through the machine—clay, fine sand and gravel; each in their turn was tried with the same results, save that the coarse material was handled a little more expeditiously. Heavy sods, six inches thick by 10 to 12 inches wide and two feet long, were dumped in and came out torn to shreds and perfectly washed of all dirt. Instead of 800 pans per hour, as claimed by the inventors, the capacity of the machine was found to be from 1,000 to 1,400 pans per hour, or 80 to 100 cubic yards per day of 10 hours, varying a little with the kind of dirt being dressed. During the trials the tailings were frequently tested by careful panning, both by interested parties and persons present as spectators. No gold was found at any time by any person in the tailings—the machine having taken up, so far as is known, every particle. The water required to run this machine may be drawn from a good well, and though a dump for tailings is always desirable, it is not essential in this machine. The inventors, in their circular of a year ago, disclaimed any hope of ever being able to compete with the sluice where water could be had, and this gold not too fine for sluicing, but this last trial develops the fact that their machine is in advance of the sluices in every respect, especially where the dirt has to be handled to get it into the sluices. Each machine gives employment to three or four men, and there is ample room in Colorado alone for several thousand of them, to say nothing of California, Arizona, New Mexico, etc. That they can be made to pay on very low-grade mines, is evident from the above figures. The fact that one party has contracted for 10 of these machines, another for 15, another for seven, while five more are bonded to still another party, and that each of these parties were personal witnesses of the test above described, speaks volumes for the machine. As soon as the contract can be let, these machines will be commenced. They will be slightly improved, and of a little greater capacity. We shall, from time to time, report on this new departure in placer mining."

### The Sierra Flume and Lumber Company.

This company was incorporated under the laws of the State of California, November 11th 1875. The object was to engage generally in the manufacture of the Sierra mountain timber into lumber, and also to manufacture the lumber into the various forms for which it is adapted. The operations of the company are of a magnitude scarcely to be imagined by those who have given the subject no attention, and the whole undertaking is so varied in its different departments as to form an interesting subject to the public.

The slopes of the Sierra Nevada are covered with immense forests of pine, spruce and fir timber, which until now has been scantily utilized, the lumber mills of the northern coast furnishing all that material used east of Sacramento. For nearly a hundred miles in length in the counties of Butte, Tehama, Plumas and Shasta, the Sierras are covered with a heavy growth of timber of the varieties mentioned, and the Sierra Flume and Lumber Company was organized to cut this timber, ship it to the mills and prepare it for market. The difficulties of carrying out the idea would not be apparent to those not familiar with the region mentioned, but they were such that it required a large expenditure of capital, such as a powerful company alone could afford to make, to carry out the plan in all its details.

The timber supply of the company lies along the west slope of the Sierra from Butte creek, in Butte county, to North Battle Creek in Shasta county, and also around Deer creek and Big Meadows, Plumas county, and the timber area is said to be ample for fifty years' operations. If the pine and fir of this region do not reach the majestic proportions of the *sequoia gigantea* found in Mariposa, Calaveras, Fresno and more southerly sections of the State, they attain an extraordinary size, and are perhaps more valuable as articles of commerce and for administering to the wants of man. Of this area of country, considerably more than one half is occupied with timber, which can be manufactured into merchantable lumber. The remainder consists of scrub timber and cord wood, and at intervals occur those valleys or basins of tillable land and meadows met with on the western slope of the Sierra.

The best timber is found at an altitude of from 3,500 to 6,000 feet, up to the snow line. Until a comparatively recent period nothing but the very fringe of this timber country was explored. No use was made of these magnificent forest trees which abounded in such quantities, except where they happened to be located near a mining camp. And then only such small portions were felled as were necessary for the purposes of mining work, or for fuel. This whole tract of country, with its wonderful sugar pine, yellow pine, spruce and fir was regarded as comparatively worthless. It is only recently that the light began to dawn upon our lumbermen, that California had within its own borders, lying neglected, a class of timber equal to any imported from the East for the manufacture of flooring, doors and window sashes. The well-known and useful redwood was supposed to comprise the valuable lumber resources of the State.

The sugar pine taking the place of Eastern white pine, and equal to it as finishing lumber, is used exclusively by the company for sash and doors and outside blinds. For all finishing lumber, and for all uses where a soft, while straight grain is required there is no wood grown on the coast to take its place. The heart is desirable for shingles, railroad ties, etc. It is largely used for box, trunk and other manufactured lumber. Heart sugar pine shingles are free from some of the objections of redwood shingles, and make an equally desirable roof.

The yellow pine takes the place of sugar pine for many purposes; it is a soft, white, even grain, but works a little harder and is a firmer wood than sugar pine, much of it resembling sugar pine so closely as to be scarcely distinguishable from it. For flooring, rustic, stepping, ceiling, wainscoting, pickets, etc., it is superior to any wood grown west of the mountains, and in appearance is all that could be desired; some of

it is as handsome as many of the ornamental woods. For building lumber, fencing, etc., is generally preferred to sugar pine; for all interior work for finishing purposes, such as windows and door frames, base boards, etc., no better lumber can be found. It is also largely used for box lumber. The heart makes good railroad ties.

The spruce, (sometimes called red fir), is a strong timber adapted for scantling, joists, timbers, and work requiring strength and durability; it stands exposed to the ground or weather. This wood is much the same and equal in all respects to Puget Sound lumber, making good railroad ties, foundation and bridge timbers, flooring and fencing. For heavy plank sidewalks, platforms, ship plank, car floors and frames, and similar work it is specially adapted. It makes good laths, that do not stain and is also very useful for shelving, being free from pitch or odor.

The fir, (sometimes called white fir), is useful for fencing, ceiling, wainscoting, scantling and makes excellent box lumber. It is free from odor and pitch. In color the wood is white and makes laths which do not stain.

The cedar is used chiefly for fence posts and is equally durable with redwood—it is in fact a variety of redwood.

With large tracts of timber of these varieties, the next consideration of the company was the means of transportation. After the value of the wood was admitted, the freighting of the lumber from the mountains to the towns and cities would make it so costly as practically to exclude its general use. It was clear that no

the Red Bluff division. The Defiance, Enreka and Clipper mills send their lumber by branches into one main flume, which delivers the lumber at Red Bluff.

On the other ridge is the Chico flume, which carries the lumber for the Cascade, Arcade and Belmont mills. The Arado mill was burnt not long since, but has been rebuilt. The Champion and Last Chance mills float their lumber into Sesma.

The mills in the mountains and the yards in the Sacramento valley are connected by telegraph lines, and arrangements are complete for filling orders as quickly as if the mills and lumber were on the railroad. The telegraph system extends along the flumes, so that the section men can advise one another of any "jams" in the flume in case any occur.

The accompanying engraving which we have prepared shows the works of the company at Red Bluff, at the bend of the river and opposite the town. The bridge shown connects the works with the town. The flume coming down from the mountains branches off into several divisions in the yard, for convenience in separating the lumber and piling. The office of the company is seen among the trees by the river, and right in front of it is where the flume empties into the river. The storehouses, stables, etc., are also shown. The railroad tracks wind about in the yard and run across the bridge, connecting with the Oregon division of the Pacific railroad. The flume is seen winding down from the mountains in the distance. This is one of the principal termini of the company. On the right is shown the large sash and door

YARD AND WORKS OF THE SIERRA FLUME AND LUMBER COMPANY, AT RED BLUFF.

logging camps could be run at a profit where roads had to be constructed and kept in order in almost inaccessible regions, and the lumber hauled forty or fifty miles to a market. The V flume then came into requisition. These flumes are built V shaped, and are intended to float the lumber, etc., down from the forests to the yards. The engineering obstacles alone were difficult to overcome, being somewhat different from railroad engineering. In a V flume the grade must be continuously downward—as, of course, the water will not run up hill—although the grade varies along the line. In some places immense trestles are made to carry the flume, which makes the undertaking expensive. This class of flume costs from \$1,500 to \$2,500 per mile, but answers the purpose admirably.

In addition to the flumes necessary to carry out the operations, saw mills had to be built, railroad tracks laid at the yard, telegraph lines constructed, and all the necessary details carried out for transacting the business of the company. The result has been the successful organization of a company second only in magnitude in the State to the Central Pacific Railroad Company. Not only does this bring into full development the timber resources of the State, but the public are insured a constant supply of sugar and yellow pine at rates much below those which have hitherto prevailed. The consumers of sugar pine have heretofore paid very high prices, so that comparatively few could afford to use it.

The company is now operating over 150 miles of V flume for lumber transportation: one flume on Chico creek terminating at the town of Chico; one on Antelope creek terminating at Sesma; and one on the waters of Battle creek, terminating at Red Bluff. On these flumes there are ten saw mills in operation with an estimated capacity of between 300,000 and 400,000 feet daily. The Moscow mill is one of the largest, and is at the head of

factory, and the fully equipped planing mill. The company have also a planing mill at Sesma, and a large sash and door factory at Chico, with a capacity of 200 doors, 100 windows and 50 blinds daily; also a large planing mill for the manufacture of flooring, rustic, ceiling, shingles, laths, pickets, moldings brackets, etc. It is the purpose of the company to manufacture and keep on hand an ample supply of seasoned lumber, and to reach the consumer through dealers, and manage its business as manufacturers merely. A full stock of all kinds and dimensions of lumber is kept, so that an order for all parts of a house may be filled at any time. The facilities for rapid shipment from the mountains and by rail offer unusual opportunities to the trade for supplying demands, without carrying large stocks of lumber in yards.

As will be seen by what we have said, this lumber enterprise was inaugurated at large cost, in the belief that the supply of the Sierras could be brought into market at prices to compete with the most favorable terms of other manufacturers. The company pay out about \$450,000 per annum, and are continually increasing their facilities. They employ over 500 men, 500 head of work cattle, 100 horses and mules, 37 logging trucks, 24 wagons, and cut 30,000,000 feet of lumber in 1876. This year they will cut over 50,000,000 feet. We have by no means given a detailed account of the company's operations, and shall take occasion to recur to the subject again.

THE HEALTH OF FARMERS' WIVES will be discussed by Dr. Dio Lewis, by invitation of Temescal Grange, in Armory hall, Oakland, at 7:30 o'clock, Saturday evening, Sept. 22d. The lecture is free, and all are invited.

THE City of Peking carried back to China, this week, 640 Chinamen.

### A Pocket Laboratory for Prospectors.

Mr. J. S. Phillips, mining engineer and assayer, of 504 Washington street, has shown us a very portable arrangement of useful tools, which he has appropriately named the "Pocket Laboratory." It is a marvel of completeness, being not only the most compact but best arranged cabinet for blow-pipe analysis and assaying we have seen. It is equally adapted for safe conveyance and accuracy. For prospecting purposes the arrangement devised by Mr. Phillips is admirable.

The case is made of lacquered or bronzed brass, and is six inches long by three inches wide, and one inch and three-eighths thick when closed, so that it is easily placed in the pocket. On placing the hinge of the box down and towards you, after opening two strips of brass that serve the double purpose of securing the cover and for filtering and test tubing beyond the end, the cover may be opened out as a table in front, whilst the two feet are swiveled out behind from the bottom of the box for an opposite adjustable collateral support. The following tools will now be exposed: a blow-pipe, a pair of pliers and forceps, platinum wire and handle, two test tubes (open and close), a small magnetized steel bar, spatula and charcoal borer, a camel-hair brush, test papers for alkalies and acids, a small glass funnel and two dozen filters. After these and three large flux boxes (containing litharge, test lead and bone ash) have been removed, a five-inch nickel beam

will appear, with pendulous needle pointer, knife-edged gudgeon and suspenders, the whole being supported upon a pendulum cradle and lowered, in a long internal guide, by a very convenient external screw.

The beam and pans now being placed in working position, and the various tools at hand, six small flux boxes are found, placed in a horizontal row, and firmly attached to the back of the case, containing carbonate of soda, borax, microcosmic salt, dry nitrate of cobalt, nitrate of potash and boric acid, which are also necessary in qualitative blow-pipe analysis and assay of minerals; and in lifting a hinged cover, in a chamber-leathered box, secured to the bottom of the case, are seen two "ton weights" (the one for furnace and the other for blow-pipe assays), and a full set of decimal Troy

weights, from ten grains to the one-hundredth of a grain, and a thread rider to be used on the beam, which is graduated to weigh to the ten-thousandths of one grain. The beam being very light and carefully balanced will weigh very minute quantities, and may be used for all kinds of assaying. We omitted to mention that the little box also contains a blow-pipe of peculiar construction, which may be closed up like a telescope for compact transportation. The price of the "Pocket Laboratory" is \$50.

Mr. Phillips appears to take great interest in prospectors and their works of exploration and mining, as in addition to this he is the inventor of the "Wee Pet" assaying machine, which packs, with all tools and fluxes, into a five and a half inch box. We are told that it will assay silver to within five per cent., and its cost, with tools, fluxes and instructions, is \$100.

"The Tester" is another of Mr. Phillips' contrivances, which is still more portable and cheaper, costing \$40, but is not so accurate, as it may be ten per cent. in error. It is a modification of the above, being more simply arranged, and its samples and buttons are measured for direct value.

To those having either of these machines, Mr. Phillips now supplies the necessary composition supports, cupels, fluxes, etc., for working about 50 assays, singly arranged in one convenient traveling cabinet, for \$20.

The "Vest Pocket Blow-pipe" is still another very convenient little instrument, with several important peculiarities, from his design, and which he supplies separately from the "Pocket Laboratory." It is just three inches long, when placed in its most compact form, and may be fitted for work in a few seconds. Price, \$3.

Mr. Phillips is the author of the "Explorers', Miners' and Metallurgists' Companion," a practical work of 672 pages, the largest and most comprehensive work on mining subjects.

### The Gravel Channels of Iowa Hill.

A correspondent of the Dutch Flat *Forum* gives the following:

Having returned home from an extended examination of all claims lying within a radius of 20 miles from the business center of Iowa Hill, I shall now continue the series of letters, without interruption, until I tell you all I have seen and all I have learned during my late trip.

I spoke in my last letter of operations going on during the summer in our immediate vicinity, supposing at the time I had mentioned all. I find, however, by further inquiry, I omitted one claim that ought not to have been omitted. Some years ago, in the first times, when gold lay scattered around everywhere, rich diggings existed at King's Hill, Elizabethtown, some two miles south of our mining center. Rich deposits were found in different places at the base of the hill, but giving out in every direction, the place has since been comparatively deserted. This summer a company, composed of some of our best men, has been formed, called

#### The Erin-Go-Bragh,

For the purpose of tunneling the main bill, to find, if possible, the original source of the early deposits. They are already in 540 feet, and intend going on, regardless of expense, until satisfied one way or the other. This company deserves great credit, and, as they are working with courage and determination, we all sincerely hope fortune will finally reward their efforts, for success at this point will add greatly to our local wealth and reputation.

We must now turn our heads northeast, some 12 miles from town, to a strip of country called the Hogshack, stretching from the old Fork's house to the Secret House hotel, and thence to Tadpole station, the present headquarters of the Iowa Hill canal company, making altogether about 23 miles from town, but still within the radius of our business center. To examine this singular strip of country, and the works commenced upon it this summer, formed the principal object of my late trip; for it promises, beyond all doubt, in a short time to become the most prominent mining feature of Placer county, if not of the entire State. From the points mentioned, beginning at the Fork's house and ending at Tadpole, 11 miles, the whole belt is one immense, unbroken gravel deposit, marked and conspicuous in its course, and evidently the old channel of the American river, now flowing along its base some thousands of feet below. The surface indications are most favorable, quartz and small black iron stones predominating. Of late years, at different times, the range has been regarded with a covetous eye, and locations made, especially while cutting the Iowa Hill canal, which traverses the entire length. These demonstrations ended where they began, and beyond locations being made, nothing was afterwards done, if we except the laudable exertions of Mr. Rennyson, of the Secret house, to get some responsible parties to take hold in earnest. Finally, a gentleman from Oroville, whose name escapes me for the moment, was brought in to see the "promised land," and, being an intelligent man, as well as an experienced miner in search of territory, his practical eye took in the chance at once, and he thereon located the Oroville. From this time, I believe, dates the speedy occupation of the whole 11 miles by companies of men from San Francisco, Georgetown, Placerville, Auburn and Colfax, capable and determined. I am told, of pushing their respective tunnels to a final issue.

The different claims on the Hogshack, as they stand in rotation, are the Colfax, San Francisco, Mao, Georgetown, Bath, McMuggins, Auburn, Riverside and Cove, requiring generally some 400 or 500 feet of tunnel to tap the channel. Of these, seven are at work, some of them day and night, and making good progress. The Bath, when in 20 feet, struck water, and their present tunnel being too high, will eventually be used for ventilation. The San Francisco, with McCarty as foreman, has sunk shafts; one, 30 feet deep, developed handsome looking gravel, with large boulders and quartz rock, but at that depth water drove them out. Their tunnel is now in over 50 feet, and the whole length is estimated at 250 or 300 feet at the outside. The largest and most central claim is the Mao, with 4,800 feet frontage, being a consolidation of four claims, the Mao, Georgetown, Cherokee and Oroville. To this claim and the San Francisco we may look for the first developments. The Mao people first ran an open cut by washing, and, when in some 30 or 40 feet, opened about three inches of gravel below the cement, which gave a decidedly good prospect. They then commenced their tunnel, considering 250 feet would strike the channel thoroughly. They had run about 40 feet at the time of my visit. As I have already said, all these claims, from one end to the other, are commanded by the Iowa Hill canal, so that if any hereafter should prove good for piping, they will have the first and best show for water.

Such is the new and extensive territory in progress of development at present. Whether any company will get through this season, I do not know. In one respect I think they have all made a mistake. Taking it for granted that any one tunnel will prospect the whole 11 miles, which is really the case, I think it a pity all the companies did not unite on either of the central claims, the Mao or San Francisco, and run the tunnel through at once. Contracts have been

taken at \$4 a foot. To concentrate on one tunnel would be far the quickest way of making a development and also the cheapest in the end to each individual concerned. However, that cannot well be done now, and so we must wait results as they come.

A few words, by the way, about this channel before I close. As I have already said, it is well defined and prominently marked throughout its course. It is quite plain where it crosses the Tadpole station into the Hogshack, thence west to Indian springs, and thence to the south of the Fork's house. Here it suggests a new idea. Is not the Hidden Treasure claim, at Sunny South, which has lately become justly celebrated for its richness, the outlet of this great ancient river bed, and not, as hitherto supposed, the outlet of the old Damascus channel? For my part, I am strongly impressed with this idea; and the more I travel over the ground from point to point, in search of connecting links, the stronger the idea becomes. Nor does the idea, taken in its fullest sense, tend to lessen the importance of the Hidden Treasure or the Damascus claim as developed facts. On the contrary, suppose this to be the main channel of the Hidden Treasure, intersected by, but not a continuation of, the Damascus channel, then the confluence of the two will naturally be the richest point on their line of territory, and so, in fact, both claims gain in importance to the last foot of ground they respectively own. But taking the initiatory, from facts as they present themselves to-day, suppose, I say, the Damascus channel has no connection with the Sunny South, still no harm is done to either; yet the suggestion accepted as it is made, in good faith, opens another large territory nearer home, to the prospector for examination, and one, perhaps, that will repay the labor. Let me ask whether this idea is not strengthened by the late failure in the Centennial shaft? Would they not have a better chance for success had they gone higher up? However this may be, I am thoroughly satisfied, from late examinations, that we must accept a thorough "change of base" before any material success attends prospecting in any branch of the Shirt-tail territory, and that the man who first disposes himself of our preconceived ideas of the Damascus channel going to Sunny South, will be the most likely man to win.

### Working Flue Dust.

The Lemmon mill has been shut down since Tuesday last, in order to make some necessary alterations and changes in the machinery. In all new enterprises much is learned in the practical workings, and suggestions as to improvements are gathered by experience. Messrs. Clark & Wallace have had many obstacles to contend with in their endeavors to profitably work the waste that pours out of the furnaces, and have very nearly achieved a success. Starting in with an old-fashioned mill, and one that was hardly calculated for the peculiar work necessary for the roasting and amalgamation of the fine particles that had escaped from the smelting furnaces, they found that a complete overhauling and readjustment of the roaster, pans, concentrators, etc., was the first step toward the successful prosecution of the work. They were still further retarded by the rust that had accumulated on the iron work, and the decay of the wooden portion of the mill, a consequence of a long period of disuse, some five years having elapsed since the mill was in operation. The dust has been hauled to the rear of the works, screened, and passed through the roaster, and from thence taken to the pans, concentrators and agitators for amalgamation. The chief trouble heretofore has been experienced in the concentrators. The dust, during its exposure, has become mixed with a large quantity of small pebbles that have been sluiced in during the washing out of the fume arrester, and blown in from the neighboring hillside. These passed through the roaster and pans without trouble, but, on reaching the concentrators, settled to the bottom and formed a hard layer. The quicksilver, sinking into this bottom, remained sluggish and failed to come in contact with the precious particles, thus interfering with the amalgamating process. If an added motion were given sufficient to keep the pebbles suspended, the result was that the quicksilver failed to gather and was drawn off at the discharge holes. Another obstacle to successful amalgamation lies in the fact that the gold and silver escaping from the flue has become oxidized, by contact with the fumes in the furnace, and in consequence the coating prevents the quicksilver from taking hold of the precious metals. The proprietors propose to overcome both of these difficulties by grinding the dust to an impalpable powder. The dust will be screened, passed through the roasting furnace, and then spread out on the floor to cool. At this point they have put in a couple of burr stones, and it will be crushed and ground between these before going into the pans. This will do away entirely with the nuisance of the pebbles and foreign matter, and the process of grinding will present new polished surfaces, not oxidized, and thus the silver and precious metals will amalgamate readily. Mr. Clark is very sanguine that the improvement will overcome all difficulties and make the enterprise a perfect success. We heartily hope that he has struck the right method, as everybody in the district is interested in the economical extraction of the gold and silver from an article that, up to the present time, has been considered as waste. —*Eureka Sentinel.*

### Fire Proof Construction.

Wm. T. Coleman & Co. make an exhibit in the machinery department of materials for fire-proof construction of buildings, which is of interest to the general public as well as to engineers and builders. Hoyt's patent iron lath and furring is now in use in many of the most important buildings in the country, and is well worth close examination. The lath embraces the maximum of stiffness, minimum of metal, and maximum of clinch for plaster or mortar of any lath made. It can be used: 1st, in connection with the patent arches, making both floor and ceiling; 2d, under arches of any kind to make flat ceilings; 3d, for grounds of every description of cornice work or moldings in plaster; 4th, for partition or iron studding, making a tight stiff fire-proof partition; 5th, for partitions using wood studs, so that when the floors are fire-proof so little wood is used there is no danger of fire; 6th, for ceiling under wood joists, etc. The lath is made of light sheet iron made in a peculiar manner so as to answer its purpose admirably.

The patent combination floor and ceiling, which consists of the corrugated arch and lath in connection, is fire-proof, strong, light and economical. The patent corrugated iron arched ceiling for making fire-proof floors is a very important improvement, and is now in extended use. A familiar example in this city is the ceiling in the Safe Deposit building. The weight of a corrugated iron arched ceiling is less than one-tenth the weight of a brick arch, so that less beams are required, cost of construction is lessened, and the relief of weight on the wall is great. In strength it is superior to that of a brick arch of the same span, as has been proved by severe tests. The arch being in one piece does not give any from the force of a blow as brick does. This method of making fire-proof floors has stood the test of all the large fires in this country. In cells for jails these arched plates are particularly adapted, giving more room in the cell and aiding to make a stronger prison.

The fire-proof shutters which are manufactured by the owners of these patents have stood many fires. Over seven thousand pairs were put up in Boston after the fire. The frame is made of one continuous piece of channel bar, and is then filled with three thicknesses of iron in shape of what is known as "leveled corrugation." The two outer plates are put into the frame with the corrugations perpendicular. The inner plate has the corrugations horizontal, or at right angles with the others, which gives immense stiffness to the shutter. The hinges are bolted through the channel bar frame, and the whole finished by a striking plate. The shutter has two air chambers, and it is claimed will not warp in the greatest heat.

Wm. T. Coleman & Co. are also agents for Hoyt's patent fire proof roof. A first-class roof of this construction is made as follows: the ceiling of the rooms is of plaster upon the patent lath; upon the upper side of the rafters is a solid covering of corrugated iron, fine corrugations, with the corrugations horizontal. This makes the roof exceedingly stiff, acting the same as matched planking. The iron is covered with an adhesive non-conducting compound, and in this are embedded the slate, which are also bolted through the whole with Swedish bolts. The result then is, working from the rooms below: plaster, iron lath, air chamber, corrugated iron, non-conductor and slate. The rooms under the roof are fully as comfortable as any in the building, being cool in summer and warm in winter.

Different styles of fire-proof roof are made for piers, railroad depots, factories, etc. In church roofs by means of the iron lath in connection with the construction, any affect designed by the architect can be produced.

The arched ceiling floor with iron lath are shown in the pavilion entirely and partly completed so that visitors can see the method of application of the plaster, etc. Wm. T. Coleman & Co. are agents for all these improved fire-proof construction materials.

MINERAL HILL.—Mining matters are very quiet at the hill. The English company have as yet made no move toward working or developing their property. Capt. Plummer, the Superintendent of the company's affairs, has given the property a thorough examination, and sent an elaborate report to London in reference to the mine. We understand he has a very favorable opinion of the ground, and has recommended that explorations be carried on with a view of determining its value. Capt. Plummer is a talented miner, of large experience, and his opinion will carry great weight with the company. The recent shipment of ore from the hill to the Lemmon mill was made by the choloriders, and is the product of their summer's work. After its reduction, and on receipt of returns, the burg will, for a short time, roll on the top wave of financial prosperity. —*Eureka Sentinel.*

A SWEET REMEDY.—H. F. Andrews, M. D., of Washington, Ga., says that cologne water is an efficacious remedy for poisoning by poison ivy. A good article of cologne must be used, and frequently applied. The vesicles should be broken when the remedy is applied.

### Our Paper Mills.

Near our stand in the pavilion is a small but elegant exhibit of the productions of our paper mills, which industry is fast assuming a position of importance among our manufactures. We believe there are five mills engaged in the manufacture of this article in this State, whose capacity and location are as follows: Eagle Mill, Point Arena, straw paper, 25,000 reams per month; Pioneer Mills, Marin county, printing and Manila paper, 65,000 pounds; Stockton Mill, printing, 90,000 pounds; Saratoga Mill, straw, 5,000 reams; Lick Mill, Alviso, straw and Manila, 5,000 reams. A large new brick mill is now being erected at Stockton for the manufacture of news paper, that is to have a capacity equal to all the foregoing mills combined, and is expected to be in running order about February next. It is to run on tule as a material.

Straw paper wholesales at about 85 cents per ream, and retails at \$1, though heavier paper rates at 15 cents more per ream. This manufacture utilizes a large amount of oat straw in Marin and Mendocino counties, where the most of this brand here used is made, which would otherwise be left on the ground to rot or be burned.

The process of making paper is quite interesting when seen for the first time. In brief, the materials are ground to a pulp, and then strained and what is retained on the strainer is the paper. That is the way it appears to a novice, and yet this simple operation requires a great deal of complicated machinery, that we have not space to explain here. Paper or papyrus has been known to writers for ages and ages, as even the ancient Egyptians made a fair article from the "tule" of the Nile. Our ancestors used mostly parchments made of sheepskins. In the early days of paper proper, only the best of material was used to manufacture it of; first linen, then cotton; now almost anything will do, as we use straw, wood, tule cactus, many kinds of weeds, and almost any light-colored substance that can be pulped.

In the paper business of this city, Messrs. S. P. Taylor & Co., take the lead in handling the home produced article, and are agents for the most of our mills. With so much competition in this business the profit of the smaller mills have been very light to manufacturers, and some of the these mills have repeatedly changed owners on account of exhausted bank accounts. Now the price is very low, but the falling prices of labor, is assisting the proprietors of the mills, so that they are still enabled to run. Messrs. S. P. Taylor & Co. have a large establishment at No. 416 Clay street, well stocked with all grades and varieties of printing, straw, manila, and wrapping papers, as also blank hanging paper, paper bags, etc., and supply any order at short notice. Controlling as they do the product of several large mills, they can fill the largest orders at a comparatively short notice, even if they have not in stock a shipment of it. Prompt attention to business, fair dealing, and moderate demands for profit, have made them popular with producer and consumer.

They make a small but elegant display of blank hanging papers in rolls, printing paper, straw, manila, and colored wrapping papers, near our stand in the pavilion, and might fill all the space that could possibly be accorded them with specimens of different kinds, but it was considered needless.

### The Ridge.

The San Juan Ridge from French Corral to Eureka is without doubt the richest and most extensive mining section in the State. All the mines in that belt yield large returns for labor expended. The claims owned by the Milton company have sent out bullion this year enough to satisfy the greediest stockholders. The North Bloomfield has had some very large returns at each clean-up, and we learn promises better at the coming one than ever before. The claims at Moor's Flat are also all doing well. But the new developments going on up there are what is attracting more attention than the returns from developed mines. The Hunt claim east of Moore's Flat, the Watt Blue Gravel between Moore's and North Bloomfield, and the Derbeck claim at Bloomfield are getting well under headway, and before many months will begin to commence taking out gravel. They will be worked by drift mining, and will, it is expected, pay better than if worked by hydraulic process. Their success will start up dozens of other claims on the same channel, and will make that section the liveliest and most prosperous on the coast. We learn that the Watt company have got their shaft down 160 feet and are going through pipe clay—a substance always found above gravel deposits on that channel. It is expected they will have to sink between 300 and 400 feet to strike bed-rock. But the balance of the sinking will necessarily be through softer ground, and more rapid progress will be made. It is safe to assert that drifting will be going on before snow flies in that section. A party of gentlemen from this city were up there this week. They report the prospects of that section as very flattering. Capital is bound to seek the miles of undeveloped ground there for investment at no distant period. There is no better or safer place to mine. There is no more extensive field. So long as such territory remains unworked there is no use of seeking distant places in which to prosecute mining. —*Nevada Gazette.*

### Canadian Patents for U. S. Inventors and Patentees.

One Patent now Embraces all the English Provinces in North America, including the Canadas and British Columbia.

It is only recently that the Canadian Government has granted patents to United States citizens. In consequence hereof the many immensely valuable inventions patented in this country are now patented in Canada. Patents are much sought for and are readily disposed of at fair cash prices. In our country about three-fourths of all manufacturing is based upon patents, especially in the New England States no manufacturing business of any consequence is started without being protected by such. Our neighbors across the border have not been slow in observing and learning that inventions and patents are the foundation of all prosperity in manufacturing purposes. Hence all our patents for labor saving and agricultural machinery and innumerable improvements in home comforts meet a ready market in Canada. Inventors and Patentees should therefore not delay to secure their patents in Canada; many good inventions are already pirated by Canadians, who, against law and right, appropriate United States inventions and have them patented in their own name. After a patent is granted it is extremely difficult to prove who is the first and original inventor. Therefore, inventors and patentees to be safe, you will have to secure your patents in Canada without delay. We have facilities for securing Canadian patents second to none. Our charges for securing Canadian patents are about \$65. A model is required.

Inventors and patentees! do not delay and lose your opportunity. Things may change. With model and description of your invention remit \$25, and we will prepare all drawings and documents and forward them to you for signature. In about 30 to 50 days we can return your Canadian patent.

**DEWEY & CO.,**  
Patent Solicitors, S. F.

### Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

[Established 1860.]

## The Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS, SCIENTIFIC AND INDUSTRIAL MEN,

Is now in its THIRTY-FIFTH Volume. It has ever been, and will continue to be, the aim and object of the publishers to make the PRESS

A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of our editors and correspondents, to seize upon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and to place the same before our readers at the earliest day. It has been well said that

A Newspaper is a Window

Through which men look upon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop, and can know but little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress books are necessarily slow and behind the times. It is only through papers devoted to the specialty which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a laggard in the race.

The Value to the Community

Of such publications in disseminating important information, in checking useless and exploded experiments, and in instigating important enterprises, can scarcely be overrated. Through them the readings and observations of thousands are collected and collated, and brought directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of just the information he needs—an unbound book forever issuing but never finished.

Nowhere in the Wide World

Is such an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here, also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world,

Useful, Practical and Directly from the Field

Of labor. The mustiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of such help our editors will be able, during the coming months, to do more than ever in furnishing information which shall be

Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

Our Illustration Department

Will still always for an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this have no need to be anything more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million," and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

SUBSCRIPTION—\$4 a year, in advance. Samples free to those who will ass in obtaining subscribers.

**A VALUABLE MINING BOOK**

BY J. S. PHILLIPS.

The Explorers' Miners and Metallurgists' Companion, 632 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal.*

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco.*

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era.*

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Orcard Monthly.*

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that he cannot afford to dispense with.—*S. F. Commercial Herald.*

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta.*

In the several sections the work is eminently practical. It is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner.*

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter.*

It is the best single English treatise we know of for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York.*

Sold by Dewey & Co., at this office. Price \$10.50.

**Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.**

**Map of California and Nevada:** The Public Lands of the Land District; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

**Instructions of the U. S. Land Commissioners:** Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emption; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement; Necessary Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissions; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

**Abstract From the U. S. Statutes—The Law Concerning Pre-emption Concerning Homesteads; Amendment; Act Concerning Timber; Miscellaneous Provisions; Additional Surveys Land for Pre-emption, List of California Post Offices.** Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S. F.

**OUR AGENTS.**

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send one but worthy men.

J. L. THARP—San Francisco.

B. W. CROWELL—California.

A. C. KNOX—Pacific Coast.

C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMBER—Tulare, Fresno and Inyo counties.

E. T. PLANK—Dakota Territory (Black Hills).

JOSEPH DUMICK—Mendocino, Humboldt and Del Norte counties, and Oregon.

W. D. WHITE—San Bernardino and Los Angeles counties.

J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.

B. E. LLOYD—Alameda and Contra Costa counties.

E. M. DENNY, Oregon.

F. B. ALDERSON, Nevada.

**TESTING AND WORKING SILVER ORES.**—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching process, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

SAMPLE COPIES.—Occasionally we send extra copies of this paper to those we believe would be benefited by subscribing for it themselves, or who are willing to hand the paper and speak of its merits to others. We call the attention of such to our prospectus and terms of subscription.

THE RURAL PRESS is one of the handsomest, best and most candid journals in California or the Union.—*Santa Barbara Press, March 17th.*

**Mining and Scientific Press Patent Agency.**

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free. Address,

**DEWEY & CO.,**  
202 Sansome St., N. E. Cor. Pine,  
San Francisco.

**Scientific and Practical Books on Mining, Metallurgy, Etc.**

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

**BY GUIDO KUSTEL,**  
MINING ENGINEER AND METALLURGIST.

**Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver.** 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It is a book abounding throughout with facts and instructions rendered valuable by being clearly described together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

**"I Will Direct them to You," Etc.**

VIRGINIA CITY, August 25th, 1877.

Messrs. DEWEY & Co., Patent Agents, S. F.—Dear Sirs:—I take this opportunity to express my entire satisfaction with the business like manner in which you secured my patent for Clack Valve, No. 103,685. At any time should I meet with a friend, or any one who needs help in the patent business, I will direct them to you. Knowing you have the advantage over some of the patent agencies in the East, I would advise any and every one on this coast who want to get a patent to employ you. Yours truly, WM. C. D. BODY, 203 South B Street, Virginia City, Nevada.

P. S.—Sent a model back East about three years since and money to one agent, praying for patent on my improvement in Spike Drawer. I sent \$40 with model, the answer came back stating they had received the money and model, but they needed \$70 more before they would go on with my application. I thought it a fizzle, so I dropped it. W. C. D. B.

**EMILE BOESCH,**  
(Patentee and Manufacturer)  
569, MISSION STREET, below Second, S. F.

Hall and Show Window Reflectors of Corrugated Tin and Silver Corrugated Glass. Sectional Globes and Style of Ornamental Lamps for Hotels, Private Residences, Churches, Etc. Ship, Railroad, Street, Car, Coach, Mill and Mining Lampe and Reflectors

Of various patterns and sizes.

SPINNING OF SHEET METAL TO ORDER.

Send for further information. Machinery is run by Steam.

**Questions of the Times.**

Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

Which is the best American watch?

The New York watch, made at Springfield, Mass.

Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be the most desirable.

Why is the New York Watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?

The most economical is the New York watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

Where can I get a New York Watch?

By addressing the long established, practical Watch makers and Jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Gen. Sam. Rice," "Chas. E. Hayward," "Aaron Lugg," "Theo. E. Studley," "Chester Woodworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

**Mining and Other Companies.**

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**California Fruit Growing Association.**—Location of principal place of business, San Francisco, Cal. Location of property, El Dorado Co. Notice is hereby given, that at a meeting of the Board of Directors, held on the fourteenth day of August, 1877, an assessment (No. 6.) of 83 per share, was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 331 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fourteenth day of September, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the first day of October, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. HORACE JONES, Sec'y. Office, 331 Sansome St., San Francisco, Cal.

**POSTPONEMENT.**—The day for redeeming the stock delinquent on the above assessment is hereby postponed until Saturday, September twenty-second, 1877, and the sale thereof until Monday, October eighth, 1877. By order of the Board of Trustees. HORACE JONES, Sec'y.

**Cherokee Flat Blue Gravel Company.**—Location of principal place of business, San Francisco, Cal. Location of works, Cherokee Flat, Butte county, Cal.

**NOTICE.**—There is delinquent upon the following described stock, on account of assessment (No. 38) levied on the nineteenth day of July, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Conway, E., Balance of certificate No. 30.	48 shares sold	03	29 81 45
for assessment No. 37.			
Randall, A. S., Balance of certificate No. 41.	102 shares sold	95	167 8 35
for assessment No. 37.			

And in accordance with law, and an order of the Board of Directors, made on the nineteenth day of July, 1877, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 1, No. 402 Montgomery Street, San Francisco, California, on Monday, the seventeenth day of September, 1877, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. O. H. BOGART, Sec'y. Office, Room 1, No. 402 Montgomery Street, San Francisco, Cal.

**Dolores Consolidated Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Wilson Mining District, Esmeralda County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh (7th) day of August, A. D., 1877, an assessment (No. 2) of twelve and one-half (12 1/2) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventeenth (17th) day of September, A. D., 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the ninth (9th) day of October, A. D., 1877, at the office of said company, at the hour of 2 P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. J. W. CLARK, Sec'y. Office Room 2, No. 418 California St., San Francisco, Cal.

**Excelsior Silver Mining Company.**—Location of principal place of business, San Francisco, Cal. Location of works, Potosi District, Lincoln County, Nev. Notice is hereby given that at a meeting of the Board of Directors, held on the fourth day of September, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold and silver coin, to the Secretary at the office of the company, 421 Washington street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the tenth day of October, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the twenty-first day of October, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

T. O'CONNOR, Sec'y, pro tem. Office, 421 Washington street, San Francisco, Cal.

**POSITION WANTED.**

Position wanted as analytical chemist by a graduate of the Laboratory of Fresenius.

Four years' experience. Address, CHEMIST, P. O. Box 884, New York City.

WOODLAND, CAL., Aug. 5th, 1876.

Messrs. DEWEY & Co.—Gents: Your letter containing the patent for my Centennial churn has come duly to hand, and you will please accept my many thanks for the prompt manner in which you attended to the business entrusted to your care, and I will take great pleasure in recommending you to any one having anything to attend to your line. I am having a number of the churns put up, which will be ready for sale in a few weeks. Yours truly, JAMES ROOT.

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

BRUCKNER'S PATENT

## REVOLVING FURNACE,

For Chloridizing, Desulphurizing and  
Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEAR-  
ING AND MINING MACHINERY.

Send for our Illustrated catalogue.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER

J. C. Sanderling, Sole Ag't Pacific Coast,  
51 Fremont Street S. F.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

## TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,  
320 Sansome Street,

(Room 10.)

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—2½ Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61½

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

D. J. O'HARRA,  
Reno, Nevada.

## LEVI STRAUSS & CO.,

Patent Riveted

Clothing,

14 & 16 Battery St.,  
San Francisco.

These goods are specially  
adapted for the use of  
FARMERS, MECHANICS,  
MINERS, and WORKING  
MEN in general. They  
are manufactured of the  
Best Material, and in a  
Superior Manner. A trial  
will convince everybody of  
this fact.

Patented May 12, 1873.

USE NO OTHER, AND INQUIRE FOR THESE  
GOODS ONLY.

25 ELEGANT CARDS, no two alike, with name, 10  
cents, post paid. J. B. HUSTED, Nassau, N. Y.

of the humid method to the treatment of Gold or Silver  
ores, associated with

## COPPER

And other base metals, or to ores free from base metals.  
It can be adapted to any first-class Gold or Silver mill, at  
a reasonable additional expense.

For further information, address

J. O. STEWART,  
Georgetown, Colorado.

## To Ship and Engine Builders, Steam ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.

Address and references can be obtained at office of Sci-  
entific Press.

# \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 10th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

Cedar Lands.

10 Saw Mills, 3 Planing Mills, 1 Sash and Door Factory,

149 Miles V Flumes, 10 Miles of Tramways

157 Miles of Telegraph Line, 13 Telegraph

Stations, and Employ 475 Men

and 550 Oxen and Horses.

The Sugar Pine is unsurpassed in quality, and the whole Coast can be supplied.

The Yellow Pine is firm, fine grained and superior to any other hard pine for Flooring, Stairing, etc.

The Spruce has great strength, durable when exposed, and especially adapted to Bridge and Ship Building, while the Fir and Cedar are as valuable for a great variety of purposes.

Last year thirty millions of feet were cut and the estimate for 1877 is fifty millions; fifteen millions are now on hand, thoroughly seasoned by the hot climate of Red Bluff and Chico.

Large orders can be filled on a day's notice for kinds of

BUILDING MATERIALS,

Rough or dressed dry, by which elegant and substantial work may be accomplished without delay at the usual cost for green lumber.

Orders for the interior filled at less than San Francisco prices and freight.

Doors, Sash and Blinds always on hand in large quantities. Address

FRED'K OGDEN, Sole Owner Tulloch Patent,

ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, Septem-  
ber 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly  
say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery;  
there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy  
machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a ma-  
chine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Stripe Mill; they were  
thrown out after a fair trial of some two weeks.

# REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

## The Thermoscopic Lubricator.

Tyne's thermoscopic lubricator, which was patented through the MINING AND SCIENTIFIC PRESS Patent Agency not long since, is a very ingenious though simple device, entirely different in design from any other thing of the kind. By referring to Fig. 1, of the engraving, its operation will be seen. A represents a glass cup containing the oil. The glass cup is connected with a brass stem or support, B, having a shoulder, B<sup>1</sup>, upon which the cup and packing ring are seated. An upper hollow screw-threaded stem, B<sup>2</sup>, extending into the oil receptacle, and a screw nut, C, under which is another packing ring, are arranged to work on the hollow stem, B<sup>2</sup>, and compress the glass cup tightly with the packing rings on the brass stem or support.

The main tube or casing, D, of the valve for regulating the flow of the oil from the oil cup, screws into the hollow stem or support, B, and is provided with orifices, F and G, and an opening at its lower end, said orifice, F, being for the inflow, and the two latter for the overflow.

The valve, H, is fast on the valve rod, J, and is compressed by a spiral spring on a small seat in the tube, B, immediately below the orifice, F, so the flow of oil is completely cut off until the valve rod, J, is raised by hand, or the sleeve, L, raised, or the thermometer, M, in the base of the cup, expands by a rise in temperature. The valve, I, on the lower end of the valve rod is intended to shorten or lengthen the valve rod, so that the thermometer, when heated, will open the valve, H, sufficiently to allow a moderate supply of oil to flow through the orifice, F.

This device is effective, substantial and economical, insuring positive safety from overheated journals or other friction surfaces of machinery. It can be applied to any machinery, whether stationary or movable, factory, marine or railway, and is applicable to the largest or smallest journals. It is positive in action, and so ingeniously contrived that it cannot fail, under any circumstances, to accomplish its object. It is self-acting and self-regulating, and obviates the trouble frequently experienced from overheated journals. The least heat generated by any extraordinary friction causes the oil to flow as freely as necessary, and the flow of oil is automatically reduced when it is no longer needed. It acts equally well in hot or cold weather, wastes no oil, and never feeds more or less than the desired quantity.

The thermometer, lettered M in the engraving, is a novelty itself, and the many ways in which this ingenious device may be utilized, establish it at once as one of the most useful inventions of the age. It consists of a series of flexible metallic chambers, communicating and connected with each other by means of central stems, so that collectively they constitute a sort of expansive bellows, so delicately made and sensitive to heat that its action is almost instantaneous.

Its power of expansion is only limited by its size and number of chambers employed. Those used in connection with the patent oil cups, at 120° Fahrenheit, will expand double their size and raise a weight of five pounds. This is an invaluable instrument for various uses besides that hereinbefore mentioned. In case of fire, by attaching an electric or other device, it may be made to ring an alarm, and by automatically opening faucets, cause a flow of water to quench the flames; or it may be used as a thermostat, for regulating the temperature of rooms or halls, or in any drying or heating chamber, or in chemicals or liquids where a certain temperature is desired. It might be used on shipboard, where cargoes liable to spontaneous combustion are earned, to insure an alarm before the lives of passengers are sacrificed or valuable property consumed.

In the lubricator a signal alarm may be attached to the thermometer, so, in the event of a journal heating, the expansion of the bellows will raise the valve-rod in the oil cup, and at the same time give an alarm by touching a trigger or by forming an electric circuit, if wires and battery are attached.

Engineers, and all practical men, know the great necessity of having a reliable cup, which will give a constant and even supply of oil. The novel arrangement and contraction of the sleeve and valve-rod in the device is especially to be admired, as the exact amount of oil is regulated at all times. Its use prevents any trouble from neglect to oil a journal, as the automatic device regulates the flow in accordance with the necessities.

In case of friction, or an insufficient supply of oil, the least warmth from the journal will so affect the sensitive little thermometer in the base of the cup as to immediately expand it and raise the rod which opens the valve near the bottom of the cup, and allow a larger quantity of oil to descend to the journal, thereby supplying additional lubrication when needed. In case the journal keeps continually warm, which is sometimes the case, thereby raising the valve and allowing the escape of too much oil, the valve on the bottom of the rod may be screwed in, thus shortening the rod so the thermometer will barely touch it, and the flow of oil can then be regulated, as before described, by means of the sleeve L. The temperature at which the

TYNE'S THERMOSCOPIC LUBRICATOR.

thermoscope will act can be regulated by this valve—on the lower end of the valve-rod. If the oil becomes congealed by cold, the hot air that expands the thermoscope will ascend the tube and liquefy the thickened oil, so it will descend in sufficient quantity for lubrication.

This device is the invention of E. D. Tyne, and is manufactured by Giovanni & Benerscheidt, Union Brass Foundry, 417 Mission street, San Francisco, and sold by the manufacturers and principal dealers in machinery and hardware throughout the Pacific coast.

A BIG GOLD BAR.—There was on exhibition, this week, at the office of August Weihe, corner of Montgomery and California streets, a bar of gold bullion weighing about 225 pounds avoirdupois. The bar is the product of the Spring Valley gold mining company's mine at Cherokee Flat, Butte county, and was originally intended for exhibition at the State fair, but the company determined upon converting it into coin, and it was accordingly sent to the refinery. The bar weighs 2,532.43 ounces, Troy weight, and its value is \$50,750.78 gold and \$81.25 silver. The Spring Valley company carries off the palm for big bars of gold, several very large ones having been made by it in the past few years.

## Importing Quicksilver.

California being the largest quicksilver producing country in the world, it seems strange to think of the article being imported here, especially at the prices quoted. Moreover, what came here was sent from Hongkong, China, to which place we export large quantities. The causes which led to this reversal of the natural order of things are not generally known, and are thus spoken of in the *Bulletin*: Until within three years at has been a comparatively easy matter to regulate the quicksilver trade in the interest of producers, and it has been so controlled. However, within the above interval the number of claims has been wonderfully increased, resulting in an unusual depression in price, compared with monopoly years. Those who had been successful in controlling the price and product when there were but few mines, thought they would again try the experiment. It was known that Flood & O'Brien, the largest local consumers, were running short of stock; that the spot supply was light, and that it was generally a good time to put up the price. So the wise men got together, and conferred with each other—not once, nor twice, but many times. All the elements could not be harmonized—at least the owners of one mine refused to go into the arrangement. The preliminary proceedings, however, were sufficiently successful to establish a temporary advance of 33 1/3 per cent., the price having been nominally raised from 45 cents to 60 cents per pound. It is claimed that Flood & O'Brien bought largely up to 50 cents, to the extent of 4,000 flasks, for future delivery. They then withdrew from the market, and went to Hongkong. There they found quicksilver selling for \$61 per picul, or 46 cents per pound, and they bought 5,000

THERMOSCOPES EXPANDED BY HEAT.

flasks as rapidly as possible, the price advancing with each fresh purchase.

The Chinese and other resident operatives, anticipating other orders from San Francisco, went into the market and bought right and left. As a result of these operations, we find that the Hongkong market rose from \$61 on the 25th of July, to \$97 on the 3d of August, a gain of 60 per cent. inside of 10 days. The stock at Hongkong, on the 25th of July, was 13,000 flasks, and it was sold and resold several times during the following fortnight, some of the buyers paying dearly for their experience. There were no more orders from San Francisco, and, of course, nothing to sustain the market. The first installment of Flood & O'Brien's purchases in Hongkong, consisting of 1,000 flasks, arrived by the *Oceanic* on Sunday, and was immediately ordered to be sent to the mines. The moral of the whole story is, that the next time our quicksilver sharps attempt to do a sharp thing, they had better take the honanza people into their confidence, or make terms with large holders of quicksilver in foreign markets.

COPPER is selling in Liverpool at £67 15s. to £68 for good ordinary brands; £68 10s. to £69 for special brands; 12s. 6d. to 13s. per unit for ore; and 13s. 3d. to 13s. 6d. per unit.

## Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Mr. Hyde in the chair. There were no contributions to the cabinet, and there were no original papers presented, but Mr. Christie read a translation of an article on a method of determining the melting point of metals and of non-conducting substances. Mr. Lockington, following the example of Mr. Christie at a preceding meeting, read a paper collated from the publications of the last two months on variability in species, confining the range of his remarks to fish, a department of natural history in which he is a specialist. The idea of this is to keep the members posted as to recent researches in science. Several of the members, who read the various scientific periodicals, make a brief summary of those things that appear of importance, and read this digest in case no original articles are presented. Dr. Gibbons gave expressions to his delight at papers of this class, and he hoped the specialists of the Academy would continue to devote a little time to their preparation. They form an epitome of what is passing in science, and are interesting to the members whose scientific enlightenment is susceptible of direction and development. The President thought such papers would be productive of greater interest in the proceedings of the Academy, attention being given to a fusion of the hard technicalities of scientific description into popular language. Dr. Kellogg concurred in the utility of information thus diffused, and felt confident that a thorough scientific man will not experience much difficulty in reducing his terms to the comprehension of the average intelligent listener. He related an anecdote of a lady untutored in the niceties of scientific description, who discovered a mollusc, and made a drawing of it, and wrote about it with such graphic luminosity that Dr. Jewett, to whom the description was sent, decided that it ought to be forwarded to the Smithsonian Institute; and there it was deemed so admirable that it was determined to publish it; and probably the example which this lady gave will be turned to account as an accompaniment of severe technical descriptions. Dr. Gibbons said this habit of collating what is written by others has the value, in the hands of the competent, of purging the sincere scientific mind from the abuses of whimsical invention. He had himself been fooled by the celebrated moon story, and ever since that time he had read with suspicion all newspaper accounts of discoveries, and had not satisfied himself that Mars has satellites.

CALIFORNIA SCHOOL LAND DECISION.—Copp's *Land Owner* for September, contains the following decision of the Interior Department in the case of Rasmus Jackson *et al. vs.* The State of California: The decision in the case of Selby *et al. vs.* The State of California was not intended to cover all invalid selections which had been certified to the State prior to the settlement of the pre-emption claimant, but it referred only to that class of selections which were voidable on account of the 16th and 36th sections, in lieu of which they were made, being within the unadjusted limits of a Mexican grant. The decision in the case of Taylor *et al. vs.* The State of California, holding that State selections of lands, held in reservation by an unadjusted Mexican grant, are void *ab initio*, is not in conflict with the Selby decision as one refers to the condition of the land in lieu of which selections were made, and the other to the condition of the land selected. The second section of the Act of March 1st, 1877, confirms to the State of California all indemnity school selections which had been certified to the State prior to its passage, except those lands occupied by *bona fide* settlers prior to certification, and excepting also the class named in the first proviso thereof, which are not confirmed, but simply subject to the right of purchase from the Government by the innocent purchaser from the State. The decision in the case of Selby *vs.* The State of California should govern in the adjustment of selections made subsequent to and not confirmed by the Act of March 1st, 1877.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Notes from Colorado.—No. 1.

[By our own Correspondent.]

#### Boston and Colorado Smelting Works at Black Hawk.

On approaching the depot of the Colorado Central railroad at Black Hawk, the attention of the tourist is attracted by a forest of smoke stacks that tower high up over the extensive smelting works of the Boston and Colorado company, located on the right of the road as you approach the depot, and filling the whole neighborhood with their smoke. Group after group of these buildings are passed as the train slows up, and you are at once surprised at their number, size and the extent of grounds covered by them.

The enterprise of the Boston and Colorado Smelting Company was inaugurated in the spring of 1867. Prof. N. P. Hill, for many years Professor of Chemistry in Brown University, after having spent some time visiting and examining the mines and ores of Colorado, and also making several visits to Swansea, Wales, organized a company in Boston, under the title of the Boston and Colorado Smelting Company, with a full paid up capital of \$275,000.

One smelting furnace and one calcining furnace, with the necessary crushing machinery, were completed in the fall of 1867. The first smelting was done in January, 1867. From that time to the present there has never been a day when the works have not been in full operation. Since then three additional smelting furnaces have been added—one in 1869, one in 1871 and one in 1875. Seven calcining furnaces have also been added to the establishment, as follows: One in 1868, one in 1869, two in 1870, one in 1872 and two in 1874.

Until the summer of 1873, the operations of the company were confined entirely to concentrating the ores into matte, containing gold, silver and copper. This product was sold to Vivian & Sons, at Swansea, under a contract made before the works were built. At this time Vivian & Sons terminated the contract by notice of a large reduction in price for matte, a reduction so large as to make it impossible for the company to continue its business on the old plan without a corresponding reduction in the price of ore. The result of this movement was to force the company into the separating and refining business, which has added a most important branch of business to the industries of the State. The capital was increased to \$500,000 by the payment of \$225,000 into the treasury, and since that time not less than \$750,000 have been constantly employed in their business.

The company was fortunate in securing the services of Mr. Richard Pearce, who had an extensive experience in a similar business at Swansea. The refining works were put into full operation in October, 1873, the first shipment of silver bars being made about the first of November of that year. While I was in the works, I had the pleasure of seeing Mr. Pearce weighing and numbering the last 10 silver bricks of the week's run. The last brick numbered 2,163, making about 130 tons of pure silver shipped from these works since November 1st, 1873. I afterwards saw these 10 silver bricks piled up on the sidewalk fronting the express office in Central City, on their way to New York.

#### The Separation and Refining

Of the gold followed closely upon that of the silver. This was done at first by making rich alloy of gold and copper, which was sent to the works of the company, erected in Boston for this purpose. Here the gold was separated from the copper by the use of sulphuric acid, and a large quantity of sulphate of copper was manufactured.

During the past year a great improvement in this process has been made by Mr. Pearce, and all the gold produced in the establishment is now sent direct to the mint in bars of a high state of fineness. The Boston works, owing to this discovery, have been abandoned.

#### This Great Enterprise

Is still under the general management of Prof. N. P. Hill, with R. Pearce, Superintendent of the processes, and A. Von Schultz, Assayer. The works and ore yards cover a large tract of ground—perhaps four acres. The smelting house is 50 by 160 feet. The storehouse for the richer ores is of stone, 80 by 150 feet. Two crushing-houses, each containing Blake crushers and Cornish rollers, have a capacity of 80 tons per day. A building, 75 by 250 feet, is furnished with eight calcining furnaces, each 40 feet long. The gold and silver refining rooms are 75 by 200 feet, containing two calcining furnaces, two melting furnaces, the fine grinding Bulthoff mill, a leaching-room, 50 by 100 feet, and melting and refining rooms for gold and silver. Fifty-two tons of ore are smelted per day. The daily expense for wood and labor amounts to \$500.

The following general

#### Description of the Process

Is copied from the Denver *Mirror*: "The low-

grade ores having been broken into lumps the size of hen's eggs, 75 to 100 tons in a heap, are piled upon a square layer of wood, which being fired and consumed in about 12 hours, thoroughly ignites the mass, which is covered with fine-screened ore to make combustion less rapid and prevent melting. This roasting process continues two months, until all the sulphur has been consumed that is contained in the sulphurets of copper and iron. Richer gold ores and those too fine to work in this way, are roasted in reverberatory furnaces. The ores (after-roasting) are next taken to the smelting furnaces, the charges for which are made up of five or six different kinds of ore, so combined that they flux each other, and produce the best possible results. This combination is determined in the laboratory, and requires the greatest skill and knowledge of ores. A reduction in the average time of smelting a charge of ore from eight hours to six, is equivalent to a saving of \$75,000 per annum. No fluxes, properly speaking, such as lime, flour, spar or iron are used. In this process of smelting the ore is separated into a matte and slag—the amount of matte representing five per cent. of the original amount of ore smelted. This matte carries all the gold, silver and copper contained in the ore, every 20 tons of ore being concentrated into one ton of matte. After crushing, the matte is next treated by an ingenious process of roasting and leaching, and the silver extracted. The residue, after eliminating the silver, is again put into matte (by smelting), and from this the gold is extracted by a process not in use by any other smelters in the world; in fact, being original with Mr. Richard Pearce. A full description of this process would require much space, with scarcely a chance of being intelligible to the general reader. The separation is performed without the use of acids or chemicals, the gold being taken directly from the gold matte by furnace processes. Silver amounting to a weekly production of \$26,000, is sent to the New York mint, of an average fineness of .999, as shown us by the returns from that office. It undergoes no further refining, but is stamped as fine silver, with a charge to the company of one-fourth of one cent per ounce."

I cannot better close this lengthy statement of this most important establishment, than by giving the value of hullion and matte produced during the nine years it has been in operation, amounting to ten million one hundred and fifty-six thousand and sixty-two dollars!—produced as follows:

Years.	Amounts.
1868.....	\$ 270,886 00
1869.....	489,875 00
1870.....	652,329 00
1871.....	848,571 00
1872.....	996,954 00
1873.....	1,210,670 00
1874.....	1,638,877 00
1875.....	1,947,000 00
1876.....	2,097,900 00
Total amount.....	\$10,156,062 00

The Boston and Colorado smelting works, under the management of Prof. Hill, have already achieved a world-wide reputation for completeness of arrangement and unsurpassed success in treating the most difficult ores, for which the people of the Centennial State may feel justly proud. Prof. Eggleston, of Columbia College, who has visited all the reduction works of Europe, speaks of this establishment as the most complete in the world.

Prof. Hill says he can purchase California ores at San Francisco quotations, pay transportation to his works at Black Hawk, Colorado, for reduction, and make money by the operation; and he proposes establishing an agency at San Francisco for this purpose as soon as he can make reasonable arrangements with the railroad companies.

#### Gregory Lode.

This celebrated lode is on the north branch of Clear creek, Gilpin county, was discovered on the 6th day of May, 1859, by John H. Gregory. Its location is within the limits of the mining town of Black Hawk, containing a population of about 1,000 inhabitants.

Since its discovery it has been opened and worked by different companies for about 3,000 linear feet.

The Black Hawk company, formerly owning Nos. 1, 2, 3, 16 and 17 west, sold, in September, 1874, the first three claims, worked to a depth of 600 feet, and equipped with a 14-inch Cornish pump, to Briggs Bros.; also leased the Consolidated Gregory mine, comprising claims 4, 5, 6, 7 and 8 west, thus giving them the ownership of 540 feet, and the management of 1,040 feet. The Briggs shaft is now down 900 feet, finding richer ore than ever before.

#### The Smith & Parmlee Company

And the New York company were consolidated some eight years ago, bringing 800 feet under the management of B. T. Wells, Esq., who has proved a successful Superintendent.

The Narragansett company's property has been operated more or less under leases, of late, this bringing all of the lode under three managements.

The main shaft of the New York and Colorado company's property, under the management of B. T. Wells, is down about 550 feet, steadily improving as it is deepened. The workings are drained by a six-inch Cornish pump. This mine easily supplies mill ore for the 40-stamp mill situated over the mine. The hoisting works, pump and mill are driven by our engine. From 30 to 40 tons of ore per day are broken. I failed to copy the last annual report of this mine, but for the year 1875, the gross amount of \$67,310.65 was realized, with a large reserve of ore unbroken. Only the low-

grade ore is treated under stamps; the rich or high grades are sold to the Boston and Colorado smelting works.

The Briggs Bros.' shaft is about 900 feet deep, and levels are to be run westward through the property managed by them. Their production keeps 50 stamps employed, and about \$35,000 are annually received for smelting ore.

The total production of this celebrated lode has been from \$4,500,000 to \$5,000,000. This estimate is made in part by the known production of some years, and in part by comparison of the known with the unknown.

If this very valuable lode could be consolidated and all worked under one management, it would be one of the best paying mining properties in the State—saving at least \$100,000 annually. And this would be but a small item compared with the increased productions of the mines under co-operative management.

The work on this lode gives employment to about 300 men; the buildings are large and substantial, and the whole appearance of the works business-like and prosperous.

#### Bottail Lode.

The mouth of the celebrated Bottail tunnel is located but a short distance from Briggs Bros.' mills. It was completed in 1872, cutting the mine about 500 feet in depth and 1,150 feet from the mouth of the tunnel. The present workings are below the mouth of the tunnel level, which has been drifted the length of the property. The main shaft is now 140 feet below the tunnel, or 640 feet below the surface.

The machinery of the mine is all under ground, at the end of the main tunnel, over the mine. It consists of two large boilers, which supply steam for the hoisting machinery, pump and air compressor. The smoke-stack is built through a shaft and is 520 feet high, 250 feet of it being a three-foot-square brick stack, and the remainder an iron stack two and a half feet in diameter. The hoisting machinery for the cage is as substantial as wood and iron could make it. In working this mine the interior arrangements are such that cars loaded with two tons of ore are loaded in the levels, drawn upon the cage by mules, sent to the tunnel level, and drawn by mules through the tunnel to the sorting floor, without handling. The output of the mine now supplies 115 stamps, or 115 tons of mill ore per day.

I copied the following statement from the books of the company. From the report of the Trustees of the Con. Bottail gold mining company for the year 1876, presented at the annual meeting, January 25th, 1877:

	Production.
Bullion from stamp mills.....	\$ 232,206 70
Ore sold to smelters.....	44,147 47
Received from tributaries.....	1,253 25
Received from rents.....	320 00
Interest.....	308 37
Total.....	\$278,235 79
Expenses.....	\$ 156,555 87
Mining.....	51,154 21
Drainage.....	14,358 46
Superintendence.....	5,600 04
Taxes and incidentals.....	2,093 38
Expenses.....	1,567 55
	\$231,259 09
Profit for the year 1876.....	\$46,975 80

I had the pleasure of visiting the fine mill of Ravalph & Sullivan, in lower Black Hawk, the capacity of which consists of 50 stamps, which were thundering away on custom ores from the Bottail, Fisk and other mines, crushing from 35 to 40 tons per day. In making up these statements, I have drawn liberally for facts and figures upon a valuable little work of Cushman & Waterman, entitled "The Gold Mines of Gilpin County, Col." G. M. M.

#### Methods of Mining at Mineral Hill.

The six car-loads of ore received at the Lemon mill and shipped from Mineral Hill, says the *Eureka Sentinel*, includes some very rich rock, and if it existed in large quantities would make that locality famous. The selected chlorides assay from \$300 to \$2,000 per ton, and represent the summer's work of the owners. They have made very favorable terms with the proprietors of the mill, those gentlemen guaranteeing a return of 80 per cent. on the assay value. The battery was started up yesterday evening, and it will be put through at the rate of 10 tons per day. A portion of the ore was extracted from leased ground belonging to the English company, and they receive as a compensation one-fourth of the net proceeds. The formation at Mineral Hill is a hard dolomitic limestone, permeated throughout with numberless small crevices and caves, and in these latter the ore has been deposited. When found it invariably runs up into the hundreds, and sometimes thousands of dollars per ton, and richly rewards the miner for his expenditure of time and labor. The work is carried on by small companies, generally by two men, who follow a stain or trace in the hard rock until it opens into one of the caves mentioned above. Sometimes months of hard labor ensue before the miner finds his bonanza, but the smallest of them rarely fail to recompense him for his work. A ton of chloride, assaying \$1,500 or \$2,000, is a very pretty pile, and compensates him for his weary toil. There is a glorious uncertainty attending this particular kind of mining that fascinates those engaged in it, and spoils them for the dull, prosy day labor that obtains in more extended operations. Those following it are of the best of their class, energetic, hopeful and skillful workmen, whose an-

hition soars above the \$4 per diem that they could readily earn if they were willing to work for corporations. It is pleasant to record that those who have devoted their time and labor to that field in the locality spoken of, have been liberally rewarded for their enterprise, the average returns far exceeding ordinary wages, and in many instances amounting to snug fortunes. Finances run low for a time both with the storekeeper and miner at the hill; but as soon as the boys get out enough ore to justify a crushing, the little village on the hill takes to itself airs of prosperity. Long-standing accounts are settled, new supplies laid in, and a short holiday indulged in; after which they soberly settle down for another season's choloriding. Under the late superintendent's administration, and owing to his being restricted by Chancery Court orders, the system of leasing the company's ground was abandoned; but since the change in the affairs of the company, we understand that Capt. Plummer will allow the miners to resume their work on the same favorable terms that heretofore obtained. The new superintendent is well liked, and has the esteem of the community in which he has cast his fortunes, and he is determined to give all the boys a chance to employ their time profitably both to themselves and the owners of the property.

#### Salmon City Mines, Idaho.

From a letter from Salmon City, Idaho, by a correspondent of the Salt Lake *Tribune*, we take the following items concerning the mines of that region:

Now, as to the mining, both gold and silver: One cannot say too much in its favor, provided the same facilities for shipping and reducing our rich ores were granted us that bless and curse the miners of Utah and Nevada. The principal mines are situated at the mouth of Jordan creek, on the Yankee fork of the Salmon, and on Bay Horse, Lyon and Killiknick creeks, direct tributaries of the Salmon river. On an air line the two districts are about 20 miles apart, but about 40 by the trails. The mines on Jordan creek are the oldest, and, therefore, will receive my attention first.

The Charles Dickens, owned by William Norton & Co., is gold-bearing, and, so far, second to none in the Territory. The lucky owners have pounded out, in a common band mortar, over \$80,000 in the past year, and still have plenty of rich ore in sight in their working and plenty on the dump. They are not excited and do not go wild over their God-send, but are working steadily, as if no rich bonanza ever trod their with its boundless wealth. They have sunk a shaft to the depth of 50 feet, and, also, run a tunnel and tapped their shaft, so that, at the present writing, they are at a depth 70 feet and on good ore, "free gold to the naked eye" all through it. What the average assay is I cannot say, but it is good.

The Ukonnow and Gen. Custer mines come next. They are both on the same lode, and are really not well defined between walls, but are, nevertheless, the finest bodies of high-grade black sulphurets ore that it has been my fortune to see. The ore lies in sight on the surface, tons upon tons, that assay all the way from \$250 to \$2,700 in silver, and also a large percentage of gold. But that curse to any mining camp (litigation) will impede the progress of the Gen. Custer. The mine is owned by rival claimants, who have set forth their wrongs before his Honor of the Third Judicial District of this Territory. When it will be settled, no one knows.

The next is the Hidden Treasure, which certainly rivals its Utah namesake for surface wealth. It is situated on the Estes mountain, nine or ten miles from the mouth of the Jordan, and the main camp. The ore is black sulphurets of silver, and is owned by Capt. Varney & Co.

They have shipped a few tons to the Banner mills, across the mountains in Alturas county, by pack animals; in fact, every pound of rock that is shipped from this camp must go by the same slow and tedious process, as there is no road and no likelihood of there being any this season.

The next that came under my observation are the mines on the Bay Horse, Lyon and Killiknick creeks. The mines, or rather prospects, are situated in easy distance from Salmon river, about 80 miles from the city; are high-grade base-metal ores and have been recently discovered. A good natural wagon road can be found to within 15 miles of the camp, where a very little work can finish the road to the camps on Bay Horse. The district is well watered and well timbered, and all the natural advantages so necessary to the welfare of the camp are to be found. The ore assays from \$50 silver and 80% lead to \$900 in silver and a large percentage of copper and lead. The principal prospect, so far, belongs to George Harland, J. B. Hood, R. Beardsley, Charles Blackburn, Timothy Cooper, S. Blackburn, Jessie McCaleb and others. The distance from Bay Horse to Killiknick is 15 miles and is one continuous belt of limestone, slate and sienite, and contains mineral wherever prospected.

Now the only drawback is transportation and the necessary capital to build a smelter. The distance from the mines to the railroad is about 375 miles, consequently the miners are compelled to go slow, shape their course as events may dictate, and "wait for the wagon," but, in the meantime, sink on our mines and find out their extent and value, so they can invite the co-operation of capitalists.

## MECHANICAL PROGRESS.

## Captain Eads' New Dredge.

Captain Eads, the engineer of the jetties in the mouth of the Mississippi, found the dredging devices which were available unfitted for his work. Peculiar conditions which exist at the mouth of the jetties render the use of a dredge boat which can buffet the waves a necessity. Therefore he devised a dredge of his own, and is now having it constructed at Pittsburg, Pa. We are enabled, by a description in the *American Manufacturer*, to compile a few points on the machine:

The principal difficulty which has interfered with the successful pumping of sand or silt from the beds of streams has arisen from the difficulty of proportioning the quantity of solid matter to the volume and velocity of the stream which is made to transport it. A given volume and velocity of water through the suction pipe is capable of sustaining in suspension a definite amount of solid matter. If too great an amount of solid matter be admitted into the suction pipe, the stream is unable to transport the excess, the pipe becomes clogged, and the pump ceases to throw either water or sand.

To remedy this difficulty, the end of the suction pipe which rests upon the bottom of the river is curved into the form of a flat scraper, four feet in width, which is armed with a steel plate, forming a bit, which may be fairly compared to the bit in a carpenter's plane. To prevent this bit from taking too deep a cut in the sand, the end of the pipe is supported on an adjustable horizontal plate, which rests upon the sand in advance of the bit or scraper. To insure the proper quantity of water entering the suction pipe with the sand, the horizontal plate just described forms the bottom of a water chamber into which the water is received five feet above the scraper. The water is forced into the chamber by the atmospheric pressure resulting from the vacuum created by the pump. The end of the suction pipe, therefore, is continually drawing in a stream of sand four feet wide, and a stream of water of the same width, both entering together immediately above the scraper; the discharge of the water chamber being immediately over the stream of sand which is passing in over the top of the scraper. The scraper is designed to be moved at a speed of from 10,000 to 15,000 feet per hour.

By a very simple device the plate which separates the sand and water as they enter into the end of the suction pipe is made adjustable, and as the whole end of the apparatus rests upon the plate on the bed of the stream, it is only necessary to raise the scraper or lower it to alter the quantities of sand and water which are being drawn into the pipe. The depth at which the scraper is cutting the sand is constantly known by the operator, and can be quickly altered so as to take in a stream of sand 12 inches deep and a stream of water four inches deep at the same moment, or these proportions can be reversed so as to take in a stream of water 12 inches deep and of sand four inches deep, or the cutter can be raised so as to bring it completely above the sand, in which event the suction pipe will receive nothing but water. The centrifugal pump in the Bayley is the largest one of the kind ever constructed in the United States, and is known as the Andrews cataraet pump. The suction pipe is 27 inches in diameter, of one-quarter inch wrought iron. It is attached to the hull of the boat in a recess four feet wide, and extending from the stern 25 feet forward.

The boat is built entirely of iron, and is considered a very superior job. It is about 200 feet in length over all, and is propelled by two horizontal high-pressure engines, each 7 feet stroke and 21 inches diameter, turning wrought iron shafts and wrought iron wheels 28 feet in diameter. The paddles are of wood, 11 feet long and 24 inches wide. The boat is surrounded by an iron bulwark about five feet high and set back two and a half feet from the side of the hull. The tanks have an estimated capacity of 1,000 tons of dredged material and water. Two overflow gates are provided for the tanks, which allow the water to escape when they are filled to the overflow level, the sediment settling to the bottom. The pump is estimated to be capable of throwing 3,000 barrels of water per minute.

**THE RESISTANCE OF SHIPS.**—Mr. William Froude, at a late meeting in London, read a highly scientific but most interesting paper, the object of which, says *Iron*, was to show the effect produced on the resistance to a ship's motion by the lengthening or shortening of the flat middle body between the bow and stern. The results were based upon experiments made at Chelton Cross with models having the same ends, but different lengths of parallel body inserted amidships. By separating the effect of the frictional skin resistance, which was proportional to the wetted surface, he showed that the increase or diminution of the power required to propel a ship, in consequence of the alteration of the length of the parallel body, depended very largely on the coincidence, or want of coincidence, of the wave-crests traveling alongside the ship with the points at which the reduction of breadth by the fine lines began. When this diminution coincided with a wave-crest there was no loss but rather a gain of speed, while when it coincided with a wave-hollow, the loss of speed, or increase of resistance, was considerable.

## Hints on Joining.

In "Andrews' Guide to Church Fitting" are some hints for the fine carpentry of church interiors, which may apply just as well to other branches of tasteful joining: The main stay of constructive woodwork is the mortise and tenon. A piece of woodwork which can be put together without glue, nails or screws, and serves its purpose, is an ideal work of construction; but this is not always possible. Another principle of construction is that every piece of wood should be so placed that it can swell or shrink without injuring itself or displacing any other piece. This is maintained in an ordinary paneled door, provided no moldings are inserted. Still another principle is that inter-joints should be avoided, whether for molded work or not, for the reason that shrinkage causes all joints to open. No piece of wood should be used unless the straight grain of the wood can be seen through its full length in one place. Inserted moldings should be avoided as far as possible; and all moldings for panel-work should be worked on the styles and rails. It is a general principle, observed in the best medieval joinery, that all moldings on rails which are horizontal should butt against the styles; and that styles should be either plain or should have moldings stopped before reaching the joints with the rails. In practice, all rail moldings may be worked the whole length of the stuff used; and if muntins (which are the middle styles) are used, the moldings may be cut away to the square wood before the mortise is cut which is to receive the tenon of the muntin. Thus the moldings will butt against the square sides of the muntin. All the parts for a door thus made can now be got out by machinery, and the door will be fully constructive in every sense of the word. There is no obstacle to this in the way of cost. The dovetail is a constructive device; and the dowel is admissible in places as a substitute for the mortise and tenon. Tongue and grooving is a legitimate device, both for ends and sides of boards. Beveling the edges of the pieces thus joined is better than beading. The best way to construct large panels is to make them of narrow strips, tongue and grooved, and beveled at the joining edges. Such panels will never "draw." The shrinkage will be divided between all the joints. Solid table-tops should never be fastened with glue or screws, but should be secured with buttons fastened to the under side of the top, which travel in grooves cut in the framework to allow for expansion and shrinkage. These are but few of the principles to be observed in doing the best woodwork.

In all kinds of lumber the heart should be rejected. All boards cut on a radius from the center to the periphery of a tree will remain true, while all others have a tendency to warp or crack. The first are called "quarter-sawn." It is a peculiarity of oak that the best grain is found in quarter-sawn boards. It is only in these that the "silver-grain" is seen. This consists of a ribbon of very hard substance which grows out from the center of the tree. It is for this reason that oak is the most enduring wood; it has a grain two ways. All woods crack in the direction of a radius from the center. Quarter-sawn oak cannot crack.

**STILL TALKING KEELEY.**—The Philadelphia papers are still talking the Keeley motor language just as vigorously as though the world had not pronounced it meaningless. It sounds like old times to read the following: "The operation merely consists, then, in a motion of the lever already described; and certainly last night its results were wonderful, and demonstrated that the power is made from hydrant water and ordinary air, no chemicals about it, and it will drive an engine and transmit power. The vapor passes from the machine into a steel shell and into a condensing apparatus, whence it goes to a small tube and thence to the engine. The valves were all opened to show the machine was clear, air introduced, and the lever was lifted, the first move showing 1,750 pounds pressure on the gauge to the square inch; and though the chamber for condensing was open, the current did not blow out a match held over it. With six and one-half pounds air pressure the gauge indicated 5,200 pounds to the inch, and then 6,700 on the third trial. On the fourth, it lifted a large lever (weighed) registering 5,000 pounds dead weight. The vapor was turned into an explosion chamber, and the cap flew off with a report like a rifle, frightening half those present; and lastly, a five-horse power engine, with three-fourths-inch stroke and 24-inch fly-wheel, was driven at 680 revolutions to the minute. The skeptical engineers were convinced that the power was there, and that it could be applied. The present machine cost \$60,000. One of the engineers said they had produced 14½ vacuum on one experiment; and 15 is perfect, as all engineers know. A public test will be given shortly." The last sentence is especially familiar.

**A MECHANIC'S LABOR AND REWARD.**—Palissy, a French surveyor of the fifteenth century, was seized with an ardent desire to discover the Chinese mode of enamelling porcelain. In the pursuit he wasted his substance, burnt his furniture as fuel for his furnace, and even sold his clothes. But he succeeded, and made a large fortune. At 90 he died in the infirmity.

**REVIVING.**—All the mills of the Allentown Rolling Mill Company are at present running with a full complement of hauls, having received a large order which is to be filled within the next two or three weeks.

## SCIENTIFIC PROGRESS.

## Mineral Growth Again.

A few months ago we had a paragraph concerning the "Growth of Minerals," a subject with which Mr. Readwin perplexed the young Royal Mineralogical Society of England. We read now, in English papers, that this gentleman, since his last paper on this curious subject, has visited the museums of Copenhagen, Stockholm, Christiania, Kongsberg and Loudon, in search of corroborative evidence of recent mineral growth at ordinary temperatures under ordinary conditions. He took some of his best examples with him, and submitted them to many eminent mineralogists. The silver specimens at Copenhagen, for size, variety and beauty, surpassed all others, probably, in the world. The silver growths, out of calcite, epidote, fluor and argenteite, were almost numberless. Some were old, others recent, and a few even infantile. He likewise found argenteite and electrum growths; the latter both out of quartz and pyrites, and including some very bright and positively very recent. Bismuth growth was also observed, and indications of recent gold growth. The Stockholm collection had the reputation of being in part the oldest in the world. There were many Kongsberg silver growths, more or less tarnished, of great size and beauty, and some small ones of recent origin; also tarnished electrum growths, a few comparatively bright. At Christiania there were recent copper growths out of fluor, foliated electrum growths out of quartz, and silver growths out of Kongsberg argenteite. At Kongsberg there was the most varied interesting collection of silver specimens it was possible to see, and silver growths in abundance, including flat plates of silver growing at the edges. At the British museum were a few small electrum growths, which he believed were recent. He added a list of his chief "home growths" since May 5th, some of which he described as of a very remarkable character.

## A Deep-Sea Sounder.

At the recent meeting of the British Association, Sir William Thompson described an apparatus he had invented to make deep-sea soundings, not with a view to exploration, but for ordinary purposes of navigation while a ship was at full speed. A glass tube, filled with air, was hermetically sealed at the top, but opened at the bottom, and prepared with red prussiate of potash. It was placed into a brass tube, which was closed at the bottom, but allowed the free ingress and pressure of water from above. The brass tube was partially filled with sulphate of iron, and wherever this iron came into contact with the interior of the glass tube it turned into a Prussian blue. The pressure of the water compressed the air, and forced the sulphate of iron up the glass tube, according to the depth to which it descended. The glass tube, part of which retained its original color, was then measured on a scale, and thus the depth of the sounding was indicated. For the purpose of being lowered into the sea, the tubes were attached to the end of a long piece of piano-forte wire, which weighed about 14 pounds per mile, and was capable of bearing a strain of 220 pounds. At the extreme end a 22-pound sinker was fixed. The absence of any friction from the wire facilitated rapidly both in sinking and hauling in. Some tubes were exhibited which had been recently used in taking soundings on board the White Star steamers *Britannic* and *Germanic*, during a voyage to New York and back. The soundings were made when the ships were going at full speed, at depths varying from 10 to 100 fathoms, and were perfectly successful.

**THE FLESH OF FRUITS.**—It is generally supposed that the flesh of the fruit provides the first food for the germinating plants of its seeds. Such, however, remarks the *Journal of Chemistry*, is not the case, for here, as in other cases, the first nourishment is drawn from the seed alone. The flesh of the fruit hears no relation to the embryo; it is a kind of outcast substance or excretion of the plant. In most of our cultivated fruit trees, too, the great mass of this flesh is the result of cultivation. Thus, wild cherries possess so little flesh that they do not repay the trouble of plucking. In the mountains of Pontus grapes are found so small that they are not worth eating; and the wild apricot, and often, likewise, the wild peach, possess no flesh at all, the former, indeed, being like a leathery two-valved capsule. The flesh of the fruit of most of our cultivated fruit trees is analogous to the enlarged roots of the turnip and beet, and similar plants, and is simply the product of cultivation, which is much sooner lost again under neglected circumstances than it was originally artificially produced. One of the most able French hotaists, Professor Lecoq, of Clermont Ferrand, instituted numerous experiments with various wild plants to induce them to form fleshy roots, and he was almost invariably successful. Just as it is the task of the agriculturalist to increase the volume of his roots, so it should be the aim of the fruit gardener to increase the flesh of the pome, stone, berry fruits, and the substances stored up in the cotyledons of nut fruit.

**PRactical INSTRUCTION.**—The *Iron Age* says that anybody with whom there yet lingers a doubt whether summer schools of science may not mean picnics and a good time generally with a few scraps of learning by way of a sandwich, may be reassured by the actual hard work required of certain students belonging to the School of Mines, Columbian College. The students referred to were 12 volunteers from the class of '78 in the department of engineering, of which W. P. Trowbridge is Professor in charge; Henry S. Munroe being assistant Professor, with this summer school under his immediate care. Last month the 12 went to Drifton, a town in Luzerne county, Pa., and there were set at work in a coal mine—the actual work of the miners, handling a pick, drilling the blast holes, loading the cars and the like. Among the lighter work required of them were the various constructions needed in the mine for supporting or lining the openings, and similar details of ordinary mining labor. Several days were thus spent, the proprietor of the mine, Mr. E. D. Cox, and the regular miners in his employ, all taking a hearty interest in the scheme. Each of the students was afterward required to furnish drawings and an essay from the notes taken during their labors. The experiment in education is regarded as highly successful.

**AMERICAN PLANTS ABROAD.**—M. Boreau, in a paper read before a French scientific society, gives some curious instances of the rapid distribution of certain foreign plants through the medium of water. The *Potamogeton digitaria*, an American grass, first discovered near Bordeaux in 1824, has spread widely in the neighboring departments, and has got as far south as Toulouse. Another grass from southern climes, the *Stenotaphrum Americanum*, is spreading its powerful roots in the sands at the mouth of the Adour. The *Anacharis Canadensis* has invaded the lakes and rivers of England, Scotland, Belgium, Holland and Germany. In Belgium and elsewhere drains have been rendered useless, and canals have been completely obstructed by these plants; and in many large sheets of water it suffers no vegetable life but its own to exist. Since 1871 this formidable stranger has been gaining a foothold in France; it has been found on the outskirts of Brest, and it swarms in the waters of the Paris parks. Another plant of the same family, the *Stratiotes aloides*, introduced in 1825 in the neighborhood of Mans, has followed the course of the river Sarthe, and abounds in the neighboring lakes.

**FLUID CARBONIC ACID IN ROCKS.**—The committee appointed by the British Association "for investigating the conditions under which liquid carbonic exists in rocks and minerals," recently reported that, according to the method of determining the exact temperature at which carbonic acid in the cavities of rocks and minerals became gaseous, the temperature known as the "critical point," at which fluid carbonic acid was found, was 39.92° Centigrade. The acid was found to be contained in minute cavities of the rocks and minerals, and experiments had been tried upon sapphires, garnets, and other precious stones, and the result had been the discovery in these of carbonic acid. A curious fact had also been ascertained—i. e., that certain bubbles in the fluid cavities approached heat, whilst others receded from it. The changes of the carbonic acid from gas to liquid and from liquid to gas were found to be produced by the heightening and lowering of the temperature; and in some of the cavities neither the gaseous or liquid form of the acid was to be found, the cavities being filled simply with water.

**MR. RUSKIN'S CABINET.**—The minerals and precious stones in the museum at Walkley now form a collection of marvelous beauty, and are almost as varied as they are numerous. They are being arranged by Mr. Ruskin in 20 groups namely, silica, oxide of titanium, oxide of iron, alumina, potassa, soda, magnesia, calcium, glucina, fluorine, carbon, sulphur, phosphorus, tellurium, uranium, tin, lead, copper, silver and gold. The founder of the institution, in his "Deucalion," informs us that "the mineralogical collection is fully described and explained in the catalogue, so that any young people may begin their study of it without difficulty, and so chosen and arranged as to be comprehensible by persons who have not time to make themselves masters of the science of chemistry, but who may desire some accurate acquaintance with the aspects of the principal minerals which compose the world;" also, that "every one of the specimens is chosen for some special character, and the points characteristic of it are described in the catalogue."

**CHLOROPHYLL**, or the coloring matter of plants, has been found by M. Fremy (as our readers may know) to consist of two principal constituents: one yellow, and called by him *phyloxanthin*, and the other a dark bluish-green, which he calls *phyllorocyanic acid*. Having further inquired into the manner in which the substances occur in the organic tissue, he concludes that "the coloring matter of leaves is a mixture of phylloxanthin and phylloxyanate of potash."

**THE electrical illumination of the Lyons railway station** is being completed. They are now using twelve electric lamps. This number will be enlarged successively to twenty-four lamps, fed with one light-producing and one light-distributing machine. It is believed that twenty-two horse power will give a power of 2,400 gas-lamps, using 100 liters each per hour.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**THE MONTERICHARD.**—Amador Dispatch, Sept. 15: We understand that steps are now being taken to recommence work on the Monterichard mine, which has been lying idle for sometime. It will be managed under the supervision of Mr. Jas. Meehan.

**TALIMAN.**—Amador Ledger, Sept. 15: It may be safely said that there is not a more energetic mining manager in the county than John Treghian, who is in charge of the Taliman. In the face of many discouragements he took hold of the Taliman about a year ago. He had unbounded confidence that there was a genuine mine there, and, in spite of all adverse circumstances, he determined to explore the mineral vein which he knew existed in that region. Months have elapsed since work was resumed on the abandoned claim; the pick of the mine has been made, the heart of the mine has been discovered, and the mine is now opening up a fine body of paying ore. A 10-stamp mill has been steadily working for months, and the increased richness of the rock discovered of late gave birth to hopes that the large outlay of money in putting the property in working shape would soon be repaid. Just at this juncture the water in the Amador canal failed, and the supply for the Taliman was a short time in danger of being cut off. For 30 or 40 days more, it was thought, would put the company out of debt, or nearly so; but the motive power gave out, and no prospect was presented other than shutting down till the commencement of the wet season. Treghian, however, was equal to the emergency. The Keystone mine, just beyond, had a prior right to the water in the ditch. Several hundred inches of the canal could be diverted to the Taliman to feed the Keystone. There was no telling how long this supply would last, nor how soon the Keystone would have to take to steam. Treghian went below and succeeded in making arrangements with the owners of the Keystone for 40 inches of their water, the Keystone works to be run partly by steam; Treghian agreeing to pay the difference in the cost of the water on account of the failure of the Taliman for running his mill. By this expedient the Taliman is still pounding away at the rock, with the very best results.

**PURKITT.**—Sinking operations continue, developments being of a very cheering character. The ore body holds its own in size, and improves in grade steadily. A five-foot ledge, we are told, has been discovered in a part of the mine where there was little expectation of finding it. Everything points to booming times at the opening of the winter. Eighty men are at work enlarging the capacity of the ditch, and putting things in shape.

**SOTO.**—Tibbets has sold one-eighth interest in the mining claim recently discovered by him and Tucker on Tucker hill, Sutter creek, to S. Manon. We have not heard the consideration paid for it. The mine is being worked right along, and promises to pan out hugely.

### BUTTE.

**GRAVEL MINE.**—Oroville Mercury, Sept. 15: Butte county abounds in good gravel mines. The only trouble is, it is difficult to reach them, and to get water to them, with which to carry on work. One of the best in all respects is to be found east of T. B. Jones's place, on the West Branch. It is 600 yards long, and runs back into the mountains a long distance. Three tunnels have been run, 50 feet deep, and in each they get excellent prospects. A flume can be made, 400 feet long, that will put 3,000 inches of water to the chute and 50 feet of head. The certainty is one of the best claims in the country, is easily opened and will last for years, with good dump and good pay all of the time. In less than five years \$100,000 will be paid for this piece of ground. How it has happened that miners did not gobble it up before is more than we can understand.

### CALAVERAS.

**RICH QUARTZ DISCOVERY.**—Calaveras Chronicle, Sept. 15: We learn that Mr. Harryhausen, a miner well known in the upper country, has lately made a very rich quartz discovery in the vicinity of Mosquito gulch. Mr. Harryhausen, while prospecting between Mosquito and the Cold Spring house, picked up a very rich piece of "float." He subsequently discovered the ledge from which the ore came, and we understand that work upon it is developing a vein of almost incredible richness. The claim is undoubtedly an extension of the well-known Grasshopper mine. The discovery has created intense excitement in Mosquito, now the liveliest camp in the mountains.

**NEW MACHINERY.**—A large quantity of machinery, designed for the Grasshopper mine, at Mosquito, passed through town a few days since. A couple of new engines and boilers are to be put up, for pumping and hoisting purposes, respectively, the machinery being now all on the ground. There is no question but that the Grasshopper is a good mine, and it would have given a favorable account of itself long ago if it had had half a chance. The company now owning the mine have abundant means, and are putting everything in tip-top condition before attempting to work it. Considering that mining is generally the worst conducted business in the world, it is really refreshing to see so gratifying an exception to that rule as is afforded by the Grasshopper company.

**GRASS MINE.**—Mining operations are temporarily suspended at the Grass mine, as the water has failed to reach the water. New shafts and reels are being put in, however, and we understand that about 100 feet of the shaft, which needs repairing, will be attended to. During the suspension, everything will be put in proper shape for active operations during the coming winter. The mine is kept free of water by running the pumps with steam.

**GRASSHOPPER MINE.**—The mine in Chile gulch, is about completed, the only work remaining to be done being the setting up of the stamps. The mill will be ready for operations whenever water can be obtained to run it.

### INYO.

**MINNETTA BELLE.**—Coso Mining News, Sept. 15: Ore stoping is still being prosecuted, with the most flattering result as to output and prospects for continuance of the ore body. The work of development on the Union is being driven ahead with extraordinary success, some fine bodies being disclosed. The prospect in the Keystone is also very flattering, some good ore being already developed. The deep tunnel, which fully develops this large ledge, is making good progress. Three shifts of men are employed. In other portions of the mine the usual activity is apparent, and the work of exploration being rapidly made. The mill is running steadily on ores from Snow's Minnetta. In a word, everything is running splendidly.

**IMPORTANT SALE OF MINES.**—On the 11th instant an important sale of mines in Lookout was consummated. J. J. Gunn, Martin Mee, W. T. Grant, John Crough and Geo. Ellis sold to Sheldon Collins, R. T. Ashman and T. P. Rudlett, of New York, the St. George, St. Louis, Light-house, Atlantic, Safety, Panamint, and Alpha veins, situated near Snow's canyon, Lookout district. These purchasers intend to work these mines in connection with the Emma, Gertrude and Dictator, situated in close proximity thereto. They have purchased the five-stamp mill erected nearly three years ago in Panamint canyon by R. C. Jacobs. The same has been taken down, and is now being removed to Snow's canyon, where it will be re-erected and running upon the rich ore of those valuable mines in less than 60 days. The work is being done under the supervision of Mr. Ashman, a practical mill man. The company has plenty of money to work with; is not incorporated, but will operate and do business as a private concern, the work of developing the mines being for actual dividends to be derived therefrom, not for wild stock speculation. Some 25 men are now employed in grading, transporting machinery and working in the

mines. We have been endeavoring, in our humble way, for the past two years, to attract the attention of capitalists to these mines. A number have made inquiry in regard to them, but on bearing they were gold-bearing, gave little attention to them, most everybody having silver-lead on the brain. We believe future developments will pay the mines to be the most valuable of any in this mineral belt.

### NEVADA.

**COPPER.**—Grass Valley Union, Sept. 15: We understand that Mr. John Treghian is about to resume work at his copper mine, called the "Fox," situated near Storm's ranch, in this township. It is claimed that the ore contains about 25 per cent. of copper, and the lead being large, profitable working can be done. Nevada county has plenty of gold, silver, iron and copper in her soil and rocks. A century from now, the people then here will about begin to know something about the resources of this section of the country.

**THE PROVIDENCE MINE.**—Nevada Transcript, Sept. 15: The most energetic mining men we have had in this part of the county for many years are the owners of the Providence mine. Many of our people think differently, simply because they know nothing, in fact, about what the owners have had to contend with. They bought the mine about three years ago, and have been working it ever since. They developed the mine, and found they had an immense ledge, varying in size from 2 to 40 feet, or an average of 30 feet. They have worked thousands of tons of the quartz, but it has not paid by mill process, judging from the looks of it, what it ought to be. The ore is of the most rebellious character, and they have done all in their power to get the best results. They have expended thousands of dollars in trying to find some process that would be applicable to their particular case, and up to this time we do not believe they have succeeded. The ore is most decidedly the worst to work ever found in the State. They have bravely continued on in the mine, and have at last been rewarded in finding a process that will pay. The Providence is down 800 feet, and the ledge averages 20 feet in thickness, all in granite formation. They have never had a foot-wall, but a perfect hanging-wall. A short time since they resumed work on the 600-foot level, which had been extended 800 feet. Almost immediately the quartz changed and was in a perfect slate formation, showing the richest ledge of rock. They are now in about 925 feet, 25 of which is on a ledge of between four and six feet thick, and the rock is very rich in free gold and sulphurets. A gentleman who visited the mine a few days ago assures us that he could see millions of specks of gold all along the ledge, and the rock was very rich in sulphurets. This rock can be worked by ordinary mill process without the least trouble, and as soon as water can be got to run the mill, the Providence will take out gold in immense quantities, and none will rejoice at the good luck of the owners more than the people of this city.

### PLUMAS.

**IRAMA.**—The company prospecting on Mill creek, south of Quincy, struck a fine ledge recently, 30 feet below the surface. The rock prospects very well. Times are lively in Greenville and vicinity. The mines generally are prospering. On Soda creek the Plumas National mill will start in a short time. The Wisconsin mill, at Wolf creek, will start in about a week. The new Rush creek mill has been running for some time, and the prospects are flattering. The extraction of the rock is being done by the Orizaba Ridge company are still working away at their tunnel, with buoyant hopes of making a rich strike. It is rumored that a rich strike in gravel has been made at Clermont hill. In the Bull Frog mine the owners have struck a fine ledge that prospects well. The Green Mountain mine, near Crescent, is paying well as usual. Standard, the crack gold amalgamator of Plumas, and Emmons and his partner, near Greenville. They think they have "struck it big."

### SIERRA.

**NORCROSS.**—Mountain Messenger, Sept. 8: J. H. Miller and partner, mining opposite Ladies' canyon, recently found a piece of gold worth about \$100. Their claim is nearly opposite Frank Beaver's place, on the South fork. **FAST WORK.**—The main tunnel of the Bald Mountain company was advanced 40 feet last week, which is unprecedented for so large a tunnel. The gravel is as rich as ever.

**PIREAZ.**—The shaft of the Pileocene is still in pipe clank, and going down slowly, owing to the closing of the bore where it is in clay, necessitating frequent reaming out to give room for the poles to work.

**MINISO.**—A gang of Chinamen have gone into the river under Durgan bridge for the purpose of working the ground. They take the wheels, flumes, etc., of the men who sunk for the bents.

**GOVERNOR STAR.**—The Golden Star mine, below Albany, is again working their Burleigh drill, running their tunnel further in for the shaft. The gravel they had a week ago did not prove to be the channel.

### TRINITY.

**IN A NEW PLACE.**—Trinity Journal, Sept. 15: Fred Haas will open his mining claim near Junction City in a new place this winter. The cut will be run into the field and flat on which the old Dacey house is standing. If there is anything to be judged by surface indications, we should say that Fred is preparing to open one of the best mining claims that Trinity county can boast of.

### TUOLUMNE.

**THE DRAPER.**—Cor. Tuolumne Independent, Sept. 15: Work on the Draper, formerly known as the old Gilson claim, is progressing rapidly. The mine is owned by Thomas Whitto, but the machinery is being put on it and the mine worked by the Soulsbyville company, who, after prospecting it for a stated time, will have the privilege of purchasing it for \$10,000. It is, however, the prospect does not please and they refuse to buy, the whole reverts to Mr. Whitto. As yet, there are but six men employed, and these are actively engaged in cleaning up the debris which has accumulated during years of inaction. Much of the top soil having washed down and filled everything with mud, but little can be seen in the mine for mud and water but in a week from now the water will be off, and the mud cleaned up, so as to enable an examination of the mine to be made. The machinery on it consists of pumping gear and hoisting works, and is somewhat different from that in general use. The machinery is driven by a 34-foot water wheel, which not only works the powerful pumps, but does the hoisting, too. A full stream of water is not necessary to work the pumps, but is needed when they want to hoist. They have it so arranged, however, with levers and gates, that the man at the brakes can, by a single movement of his foot acting on a lever, start on or off the required amount. Contracts are being let to work the mine, and soon we may expect to see the puffing steam engine, or listen to the roar of the noisy water wheel.

**SOUTHERN MINE.**—As active and busy as ever. Four carpenters are employed, and work on the mill is progressing rapidly. The mortar block, for the new five stamps in course of erection, is in place, and soon five more stamps will be added to the original 10, making in all 15 stamps, with cast-iron batteries and everything complete, even to a rock crusher. The sulphurets are being saved, and a gentleman by the name of Mr. Morrell is erecting machinery to extract the gold, which experiment has been so often tried, but always resulted in failure to make them pay. We understand that he has the privilege of working the sulphurets for six months, when the whole will revert to the company, at cost. Descending the mine, we examined in their winter supply of wood for the steam engine, and the many levers, which are constantly arriving, present a busy scene; two, five and six-horse teams, with

double-acting wagons, carrying from four to five cords of pine wood each, arrive daily from above Northrup's, while half a dozen smaller teams come with perhaps three or four loads a day from the ranches close by. Such an immense pile of wood has accumulated that, for convenience, they have laid a track, and intend to lay another to get at it handy.

## Nevada.

### WASHOE DISTRICT.

**DE FREZ.**—Gold Hill News, Sept. 19: On the third, or 21st level of the mine, the ledge is 8 to 10 feet wide, carrying low-grade ore. In the stopes below the second level, about 150 feet north of the main shaft, very rich ore was found, which is liable to be struck at any time by the men working on the third level. An additional force has been put on, stoping out the richest ore. The four-stamp mill of the company has started up, and in a week or two regular bullion shipments will be made.

**LEVATHAN.**—Owing to the hoisting or galloways frame giving way on Monday morning last, work in the mine is temporarily suspended. No serious damage was sustained in the accident.

**LADY BAYAN.**—Some little delay has been experienced in finishing up the details of the machinery, but the whole will be completed shortly. The new hoisting engine is a duplicate of that of the Caledonia, and is one of the best of its capacity in this section. The pumping engine is also of the latest and best pattern.

**MEXICAN.**—The north drift of the 1000-ft level is steadily advancing in good ore indications. The Mexican and Ophir joint mine, at the 1700-ft level, is making good progress downward with the aid of the Ingersoll drill. Rock very hard.

**GOULD & CURRY.**—The connection of the north drift, at the 1700-ft level, with the Con. Virginia gives good ventilation, and is gradually making the north drift of the mine affected by sinking the main incline is resumed.

**SAVAGE.**—It will take about a week or 10 days more to put in the new pump rods and plumb up the pump shaft, after which it is expected that the water will be more easily conquered. Meanwhile a baling tank is employed to raise the water and send it out through the Gould & Curry, and with the assistance of the Hale & Norcross pump, water is kept out of the mine.

**OVERMAN.**—At the 400-ft level, the main drift south, to connect with the Caledonia, is steadily advancing, with its face in bird's-eye porphyry, carrying occasional streaks of quartz.

**CALEDONIA.**—The drifts north, at the 1400 and 1000-ft levels, are still driving ahead, both in very favorable vein matter, the last mentioned showing considerable improvement over last week.

**ORUIT.**—The drifts north and east, at the 1000-ft level, are advancing in hard blasting rock. The south drift, at the same level, is in soft ledge matter.

**HALE & NORCROSS.**—The pumps continue fighting nobly against the chronic flood, and when the Savage pump aid shaft is again in good trim, the combined forces are expected to reduce that water very speedily and effectually.

**SILVER HILL.**—The new incline pump works splendidly and has been very effectual in reducing the water.

**CON. VIRGINIA.**—The usual daily yield of 550 tons continues to be contributed from the 1200, 1300, 1400, 1500, 1550 and 1650-ft levels. The ore breasts and stopes at all points are looking and yielding finely, and twice the amount of ore is being taken out of the mine. The stopes and breasts east and west, at the 1650-ft level, are looking splendidly, and more and more rich ore is developed as the sill floor is advanced southward. The main drift west from the C. & C. shaft, at this level, is being continued toward the west wall of the ore channel, and the face is in hard-blasting ore, which will mill about \$40 to the ton. This drift is running straight to connect with the Consolidated shaft, which is being run in the same direction from the 1550-ft level. A small engine is placed in the 1550-ft shaft, so that the sinking is being conducted without the aid of the surface engines, or interfering with the workings above. A branch drift is also being run from this station to facilitate working the south ore body. Drift connection with the Gould & Curry at the 1750-ft level, recently completed, affords most excellent and much needed ventilation. The connection made in the Consolidated ground, and the Gould & Curry drift being 10 feet the lowest, the Consolidated drift is being continued south above it for a sill floor, in order to run the ore out to the C. & C. shaft. Cross-cutting from this drift will be commenced forthwith, and better ore is expected to be met with, that in the drift not being of a high grade, owing to the work of the lower outskirts of the horse head in the level above.

**YELLOW JACKET.**—At the 2200-ft level the main drift east is in 315 feet. The main south drift is in 275 feet, 28 feet having been added; the face is in quartz and porphyry. Nineteen feet have been added to the length of the main drift north from the mine, giving a total of 104 feet. The face of the drift is in ledge porphyry, with streaks of quartz. No other work of importance is being done in the old mine, the prospecting operations being confined to this level. Very little water is met with in either drift.

**BELCHER.**—The main drift south at the 1000-ft level is being steadily pushed forward, with its face in porphyry and quartz. Nothing new developed by the prospecting operations at the 1000-ft level near the Segregated line. The connection between the joint air shaft and the Crown Point at the 2000-ft level of the latter mine is being completed, and the shaft is being discontinued at present in order to make some necessary repairs to the timbering of the same. This shaft and incline has reached to within 50 feet of the 1000-ft level. When that level shall be sufficiently advanced, it is proposed to make a raise-up to the bottom of the incline, sending a drill hole ahead to tap and gradually draw off the water in the incline.

**UTICA.**—At the 1000-ft level, where the work of the mine is at present concentrated, a large amount of effective work has been and is being done. On the southerly portion of the level a splendid vein of solid quartz, 97 feet in width and 300 feet in length, is developed by the main drift south, and several cross-cuts east and west from it. The whole of it is in low-grade ore, which would mill \$10 to \$12 to the ton, and the average.

**CALADIA.**—Daily yield 600 tons, keeping the mills all steadily running as usual. The ore breasts and stopes of the 1500 and 1550-ft levels continue their rich showing and regular yield, and the 1000-ft level shows especially well both in quality of ore and in constantly increasing quantity to the south, east and west. The 1050-ft level is also opening out richly in all directions, and the various cross-cuts, stopes and breasts show more ore in sight than is needed at present. The north branch from the C. & C. drift at the 1750-ft level, is nearly into the ore vein, and at the 1840-ft level the south drift is advancing in hard blasting ground. The amount of rich ore exposed in this mine is simply fabulous, and yet its extent is not fully developed by any means. It certainly is good for dividends for many months to come.

**FOR SCATES & GEORGE DOWDAYS.**—Work at the new combination shaft is being pushed forward more actively than ever, an additional shift of men being put on. A station is being cut out at the 200-ft level for a cross-cut through the ledge at that point to the west wall. The east wall is well defined, and shows some very fine looking quartz lying near to it. This is being assayed, and it is expected that by the time the drift reaches the west wall, good milling ore will be developed.

**JACKSON.**—Daily yield, 450 tons. The face of the lateral drift, south from the east cross-drift at the 1150-ft level, is showing good bunches and streaks of ore, and a good development in that line is anticipated at almost any time. The upper part of the 1000-ft level continues in good ore. The drift at it is in the 1000-ft level shows improvement in both quantity and quality of the ore, and the water in the mine sunk below this level is being slowly drained by the Silver Hill mine. The ore breasts and stopes of the upper producing levels are looking and holding out well.

**HORSTMAN.**—Owing to making certain necessary surface improvements, but small progress has been made in sinking the main shaft during the past week. The flow of

water is steady, but does not materially impede progress.

**HELIOS.**—The retimbering of the shaft has been completed, and preparations are being made for resuming work in all directions. The shaft is in splendid condition.

**CHOLLAR-PORTER.**—Daily yield, 75 tons, from the old ore sections. The main drift east at the 1755-ft level, toward the Chollar-Norcross-Savage combination shaft, has, together with the main Chollar shaft, been undergoing necessary repairs to the timbering during the week. This drift is within 700 feet of reaching the combination shaft, and can be made to connect with it as soon as the Suro tunnel can.

**UTAH.**—At the 1150-ft level the main drift south is in 425 feet, with the face in hard-blasting rock, resting on the conglomerate. The south drift is in 140 feet, in about the same sort of material. The incline vein is steadily being continued downward in favorable working ground. Water increases somewhat, but is easily handled.

**CROWN POINT.**—The connection being completed between the main drift south at the 2000-ft level of this mine and the Belcher air shaft is an important and very advantageous one in the way of ventilation, as well as of drainage. Some fair grade ore continues to be extracted from the old upper levels.

**EXCHICQUER.**—The combination drift on the 2003-ft level is making fair progress in vein matter, without any material change since our last report. The east cross-cut on the 2000-ft level is making good progress in very unobstructed ore in the way of ventilation, as well as of drainage. Some fair grade ore continues to be extracted from the old upper levels.

**BEST & BELCHER.**—Good progress continues to be made in sinking winze No. 2 below the 1700-ft level. The rock is very hard, but grows softer. The drift connection from the Gould & Curry to the Consolidated Virginia, through the Best & Belcher, is of great benefit in the way of ventilation.

**IMPERIAL CONSOLIDATED.**—Work in the south winze from the 2135-ft level is going on as usual. A station is being cut out on this level for the purpose of starting an incline whiz between the Imperial and Alpha ground. The main work of the mine is confined to these two points.

**UNION CONSOLIDATED.**—The repairs to the drift eastward at the 1300-ft level are being pushed forward to completion. The machinery, and the joint cross-cut east at the Mexican line, 1405-ft level, is driving ahead in very promising vein matter.

**SUCCESS.**—Sinking the main shaft is making the usual good progress, everything working well. More streaks of quartz are coming in at the bottom, and the indications are more favorable as depth is attained.

**UTAH TAILINGS.**—The material in the face of the drift continues to drill and work badly, being soft porphyry, with streaks of clay and quartz, requiring close and constant timbering. No increase of water.

**NEW YORK.**—Very good progress continues to be made in sinking the main shaft below the 800-ft level. A slight increase of water is met with, but not enough to impede operations.

**UTAH.**—At the 1050-ft level both lateral drifts north and south are steadily progressing along the wall of the ledge, in favorable ground.

### BRISTOL DISTRICT.

**JACKRABBIT MINE.**—Pioche Record, Sept. 15: A large number of our citizens paid a visit to the Jackrabbit mine, in Bristol district, on Saturday and Sunday last. They all expressed themselves in one way, and that was to the effect that it is the "biggest" prospect they have ever seen for the amount of work done. Garrison & Emory were very obliging, and took the pains to show all visitors the extent of the ore in sight, and how they intended to mine it.

**PROSPECTIVE.**—The recent developments in the Jackrabbit and Mayflower mines have again started the prospecting element of Pioche out in search of new mines. Daily, for the past two weeks, a number of men, some of whom have left paying jobs, have started for Bristol and its vicinity, to see if they will not be lucky in striking something rich and paying, and we hope before long to see a considerable number of good strikes in that section. If several are made similar to the Jackrabbit and Mayflower our citizens will not care whether the Trustees of the Meadow Valley mine put in the pump or leave the mine as it is.

### ELY DISTRICT.

**RAYMOND & ELY.**—Pioche Record, Sept. 15: Things are going along as usual in this mine. Part of the week has been occupied in putting a fan on the lower level, interrupting work a few days. In the progress that has been made in the mine, the ledge looks as heretofore. The mill is running regularly, half on ore and half on tailings. The men discharged from the mine had been engaged for some time back in doing dead work, which was no profit to the company at present. It was too much expense to the mine to keep them at work running in that way, therefore they had to be discharged.

**MOVING.**—The work of moving the Floral mill to Condon canyon commenced on Monday, in the taking to pieces of the machinery. Only a light force of men are employed at present, but they will be increased as room is made for them. We understand the work of removal is to be completed in 30 days.

**PIOCHE BULLION.**—Wells, Fargo & Co. shipped during the week, bullion valued at \$4,508.

### ELLSWORTH DISTRICT.

**RECH MINES.**—Belmont Courier, Sept. 15: That Nye county possesses rich mines no one can deny. The ore shipped from Ellsworth district to the Sacramento reduction works, within the last few weeks, leaves no more room to doubt that if prospecting is thoroughly carried on, many such mines as the Downey and Illinois could be found. Judge Downey yesterday received a letter from Sacramento, informing him that the ore from his mine had been assayed, and averaged \$225 per ton in silver. Fifteen tons of high-grade ore are now on the way to the works. Work is also progressing finely in the Illinois mine. The ledge varies from five to seven feet in width and carries rich carbonate ore. The shaft is now down 240 feet.

### EUREKA DISTRICT.

**MINERS AT WORK.**—Eureka Sentinel, Sept. 15: The Eureka Con. mine and furnaces employ about 300 men, whose daily wages aggregate the sum of \$1,200; the Richmond company, 150 men, \$900; the K. K. Con., 130 men, \$820; the Jackson, 20 men, \$104; the Connolly, 25 men, \$80; the Bald Eagle, 16 men, \$84; the Hamburg, 70 men, \$280; Matamoros, 30 men, \$120; Lemmon mill, 25 men, \$100, and the small outcrop mines in the neighborhood, 100 men, \$400. It will be seen by the above that there about 860 miners and furnacemen now at work in the district, the daily wages amounting to about \$3,500, or \$105,000 turned loose on the monthly pay days. Add to this the sums disbursed for coal and other supplies, and it will be seen that considerable coin finds its way into circulation in Eureka. It is probable that the men employed on the Eureka mine will be put upon the rolls, which will proportionately increase the grand total.

**BULLION TAX.**—The tax upon the net proceeds of bullion from the Eureka mines, for the quarter ending June 30th, was \$382.85. Of this amount the Eureka Con. paid over \$700 of the total tax collected. It is a rather insignificant showing, but the present quarter the bullion tax will run up into the thousands, and the production for the three months will be much greater than any former yield in the history of the district.

**AT THE RICHMOND.**—Operations at the Richmond reduction works are being carried on at a lively rate. The two furnaces are steady at work reducing ore, and the quartz discharged from the mill turned out exceeds all anticipations of the managers. The refinery will start up to-day, and shipments of lead and silver follow shortly. Three ore trains, of 10 cars each, an aggregate of 150 tons, arrive from the mine daily, and the quantity will be increased as it is needed. There is a report that two more furnaces employed on the reduction of ore from the Eureka mine and tailings outside ore is being smelted. The Bald Eagle sends in a daily shipment of 10 tons, and other lots from Pros-

(Continued on page 188.)

### Bedrock Flumes.

#### A Chance for Cutting a Profitable One in Idaho.

We take the following from the *Idaho World*, published in Idaho City: Several years ago the question of practicability of constructing a bed-rock flume in Moore creek was considered in a business light, and a survey made to ascertain the amount of fall to the creek, commencing at a point about six miles below Idaho City, and running to a point about two miles above town. The grade was ascertained to be light, but sufficient to run with a large body of water successfully. Our delegate in Congress, Hon. S. A. Merritt, was requested to procure the passage of a bill through Congress, granting a right of way and privilege of using timber, stone, etc., in constructing the work. For some reason or other unknown to us now, the right of way was not granted; and not long after, some of the leading spirits in the enterprise left the Territory, transferring their means to other fields, and directing their business talents and energies in other channels. So the enterprise slumbered, and the

#### Vast Amount of Wealth

In gold and silver that ought to be taken out, still lies at rest in the bed of the creek. There is an extent of six miles in Moore creek and one mile in Elk, from its junction with Moore, that may be treated as ground that can be profitably worked through a bedrock flume on a large scale. These seven miles will average more than 600 feet in width and 12 feet in depth of tailings; top dirt that was stripped off of bottom gravel in early days, and occasionally new ground. The lowest possible estimate of the amount of gold contained in this seven miles of creek will exceed

#### Eleven Million Dollars,

Besides what is contained in the thousands of acres of low bars and flats that skirt the creek, and cannot now be worked for want of fall or dump. In addition to this amount of gold, it is estimated safely that

#### One Hundred Tons of Quicksilver

Lie so intermixed with the tailings that a company working the creek would have the advantage of at least a hundred thousand dollars worth of this article so indispensable in the working of mines.

These estimates are made so low that there can be no possibility of results falling below estimates; while the probabilities are in favor of obtaining double the amount of gold stated in the estimate. We ask for a thorough investigation of this matter by those interested in the prosperity of the country, and if any one can show the estimates to be unreliable or overdrawn we will be pleased to have them do it.

Besides the bullion obtained directly from the working of the creek bed, the advantages resulting from it indirectly as an artery of drainage, and as affording dump and outlet, are incalculable; and such a work would yield an annual revenue to the owners as a receptacle for tailings and second washings, after the creek bed shall have been worked out, as long as there is gold in the hills that rise from the creek.

After the expiration of Merritt's term in Congress a bill was drawn up and placed in the hands of Hon. John Hailey, who was then the delegate, but for some reason he failed to procure its passage. The bill provided for a right of way up the creek, together with the privilege of using timber, etc., in constructing the flume.

The franchise asked for could not deprive any one of their rights, neither could it have any other than a beneficial effect upon the interests of any. Without the flume they can never work a foot of their ground while time lasts, while for the privilege of dumping into the flume they could afford to pay a reasonable percentage of the gold yield and be greatly benefited in the end.

The company that was incorporated several years ago and made the survey of Moore creek, also embraced in their enterprise Graute creek and Grimes' creek, each of which are equally as rich, it is considered, as Moore creek; but it seems to us that the enterprise is too vast for one, and that three distinct companies would be more certain of success.

There is not sufficient local capital that can be enlisted in this enterprise to warrant the undertaking, but surely our citizens ought to be able to enlist foreign capital sufficient to carry the work into successful operation. When engaged in, it will pay a company largely, and afford profitable employment for at least 500 men for 12, 15 or 20 years.

A New York company has recently bought placer mines in Chile, and are preparing to work them by hydraulic process. They are to erect a 400-horse power engine to raise water from Catapilco lake to an elevation of 450 feet (into a reservoir), which is to be used in the pipes. The sluices are to be paved with railroad iron, and all the works are to be first-class and under the superintendence of an experienced California miner. The ground that all this capital is employed to work prospects 50 cents per ton.

There is no miner among us but who knows the ground we propose to work in Moore creek will pay more than 50 cents per ton, including that which lays on the bedrock. A great deal of top gravel was wheeled back in early days that would pay three and four "bits" to the wheelbarrow load. There are benches left here

and there along the bed of the creek that will pay that much to the pan of gravel; and yet we, for want of capital and enterprise, are allowing this grand field to lie unworked, while there are millions of dollars seeking investment, and some of it going to foreign countries to be engaged in less profitable enterprises.

After the first three miles are constructed, the work will be self-sustaining, and from the fourth mile will be dividend-paying; so that an outlay of \$90,000 would be in all probability ample to put in motion an enterprise of more importance to the country than the development of any half dozen quartz mines in it. This enterprise accomplished, will infuse new life into the country, increase its population and revive business. Real estate of all kinds, all over this county and Ada, would enhance in value on account of the increased business and increased demand for farm products. It is an enterprise that the business men and agriculturists of the country are more deeply interested in than even the miners themselves. Shall the matter continue to slumber, or will a few men most interested and most able put their shoulders to the wheel. With four miles of flume laid in either one of these creeks—Moore, Grimes or Granite—three years would not elapse without the other two being in operation also, the beneficial results of which would be great and permanent.

### Timber for the Mines.

#### Where the Lumber for the Comstock Mining Operations Comes From.

The distance from Carson City to Glenbrook, by way of the Clear Creek pass over the eastern summit of the Sierra, is 14 miles; to the summit of the pass but nine miles. A few years ago this range of mountains, from base to summit, was covered with a dense growth of pines. Much of this timber, it was believed, would never be available for commercial purposes on account of its seemingly inaccessible location. The great demand of the mines for wood and timber supplies soon, however, swept away the most accessible portions, and set at work the ingenuity of man to devise ways and means for getting at the rest. H. M. Yerrington, of the firm of Yerrington, Bliss & Co., and present Superintendent of the Virginia and Truckee railroad, was the first to solve the problem.

#### The Big Flume.

This he did by building a large V-shaped flume from the summit to the valley, which was double-boarded inside with three-inch plank, and large enough to float a 16 or 20-inch timber with ease. This flume is 14 miles in length and was carried down over rocky, rugged portions of the mountain, perfectly inaccessible to any other method of conveyance. Nothing of the kind had ever before succeeded in this section of the country, as it was not only necessary to crook and curve the flume badly in many places, but to give it in others a fearful pitch or fall, which was likely to make it choke, run over, and cause the loss of much lumber and wood. In order to prevent this, men were stationed at the most dangerous places, and provided with an instrument for lifting and handling the timbers so perfect in its strength and shape that a single man perfected in its use could lift the largest log or piece of timber when in motion from the flume and land it safely on the ground. On the summit this flume has been gradually extended, both north and south, until the beautiful pine forests that covered the mountain peaks have melted away, and nothing is now left to bless the gaze of the eye save the bright blue skies and heaps of naked granite boulders. This flume, at a day's run, has often delivered from the summit to Carson City 500,000 feet of lumber and 750 cords of wood. The summit of the mountains once swept, the longing eyes of the capitalist were soon turned to the grand old forests that hung in dense profusion on the borders of Lake Tahoe. But how were they to make them available?

#### The Narrow-Gauge Railroad.

The eastern summit was 1,500 feet above the level of the lake, and to reach the flat border next the water, it was necessary to descend a steep and rugged mountain side 1,000 feet almost perpendicularly. But the avarice of man, when stirred up by visions of wealth almost within its grasp, pauses at no barrier, and in a short space of time it was announced that Yerrington, Bliss & Co. were building a narrow-gauge railroad from the margin of the lake to the summit. A few days since a representative of the *News*, leaving the stage at Summit station, accepted an invitation of John A. Johnson, the efficient and courteous superintendent of the road, to enjoy the pleasures of a ride over the road from the summit to Glenbrook. The road is nine and a half miles in length, the steepest part of the abrupt portion of the grade being 165 feet and the least 120 feet to the mile. Seated on the pilot or cowcatcher of the engine, we had but fairly started before we entered a tunnel hewn through solid rock a distance of 500 feet. Emerging from that, we glided swiftly down the mountain side, dodging quickly and cautiously in our tortuous course around the huge cliffs and piles of granite that blocked our way, until, reaching a craggy point of granite along which the road ran, the lake like a grand and beautiful vision opened to our view. So delightful and absorbing was the beautiful landscape upon which our eyes rested, that we noted not the route over which we were

borne so swiftly, until, casting our eyes downward, we found ourselves on a rocky promontory at the almost extreme end of the road. But a few feet more would have reached the end and hurled us over a huge precipice, hundreds of feet, into the lashing waves of the blue lake below. Just as it seemed as if nothing could save us, and the trestle-work on which the road rested appeared to be giving away beneath us, the locomotive whistle gave a wild shriek, the engine was reversed, a switch was opened at the back end of the train, and we glided gently backward down the mountain slope for a quarter of a mile; then another switch was opened and we dashed ahead for about the same distance; then again reversed and backed down, and so continued to do, the track of the road describing the exact figure of the letter M, until the more favorable ground of the margin of the lake was reached, a thousand feet directly below the point from which we started. The engines used on the road were manufactured to order and are models of beauty and strength. A single engine hauls up the steep grades, with apparent ease, a train of six or eight cars heavily loaded with lumber or wood, which, on reaching the Summit, are dumped into the flume and sent on their way to Carson City.

#### The Mills.

On the margin of the lake at Glenbrook the company have erected two model saw-mills, complete in every modern device and improvement for cutting logs brought from the opposite side of the lake into lumber and timber ready for shipment. For a time attempts were made to gather in the beautiful pines of Lake valley, at the head of the lake, but the heavy quicksands stretching back for a long distance prevented a successful accomplishment of the work. To overcome this, probably, the first engine and railroad in the United States for logging purposes was built. When the order was given for the building of this engine, and a statement of its intended use made to the manufacturers, they could hardly be convinced that a locomotive and railroad could be used for such purposes. The judgment of the managers, however, proved correct, and the enterprise is now one of the most successful possible. The road track is made portable, so that as fast as one swath of the great pines is swept away the road is moved over and another is commenced.

#### The Meteor.

For a time the company experienced much trouble in getting booms of logs conveyed from the opposite shores of the lake to Glenbrook quick enough. Sudden changes of weather are liable to occur, and strong gusts and whirls of wind arise suddenly on the lake, which are liable to wreck and scatter a boom of logs while under transit. To overcome this trouble the company had manufactured in the East, at a cost of \$30,000, one of the most substantial and swift little iron steamers ever set afloat. Light of draft, and gliding through the water at the rate of 22 miles an hour, it is more like a thing of life than a combination of mechanical skill, and bears the name of *Meteor* on her prow with an appropriateness seldom equaled. On every side of the lake the mountain gorges are being swept by this company of their wealth and beauty. Already huge barges are floating wood, a thousand cords at a trip, to the terminus of the narrow gauge at Glenbrook, from whence it is shipped to Virginia and Gold Hill to supply our mills and mines.

The energy, enterprise and courage displayed by Yerrington, Bliss & Co., in the successful building and operation of these flumes, railroad, mills and steamers, is almost wonderful, and furnishes an example of determination and industry seldom if ever equaled.—*Gold Hill News*.

### A New Tunnel Project.

The *Salt Lake Tribune* says: For some time past, George A. Jackson, a well-known mining superintendent of Bingham, has been watching the course of all the main producing veins in West Mountain district, and has concluded that they all sprang from one center—the great Bald mountain of the Quirrh range. From this mountain runs a spur in a northeasterly direction, Butterfield canyon being on the south side and Bingham canyon on the north. It is into this spur, near the junction of the main range, that all the veins point. Another feature is that the nearer you approach the main range, the higher grade the ore becomes in silver, and, in some cases, fine chutes of gold-bearing quartz have been found, assaying up in the thousands. This is the situation as found by Mr. Jackson, who concluded to at once locate a tunnel cutting the ledges of ore at right angles, commencing in Butterfield canyon, running in a northwesterly direction into Carr Fork canyon. This will certainly cross-cut every ledge known in Bingham canyon, and many fine veins not heretofore discovered. It is certainly destined to be one of the largest and richest mining enterprises of Utah. Work has already commenced on the tunnel, and Mr. Jackson, as manager, proposes to push it as fast as he can by hand, and as soon as machinery, such as compressors and power drills, can be got, will drive it at the rate of 50 feet per week. The chances are that before 1,000 feet have been driven the tunnel will be in pay ore and become remunerative to the owners.

Mr. Jackson is now incorporating the claim, and parties in California have also examined the claim and propose joining him.

### Gravel Mining in Tuolumne County.

There is little doubt that Tuolumne county contains a number of gravel beds that are destined to be made profitable when worked in a proper manner. For some reason there is not to this time a single gravel claim worked as it should be, to get profit where gold is sparsely scattered. There are many things connected with the working of gravel, on a large scale, that has been neglected entirely by our miners; but the time is at hand when there is every reason for believing that in this class of mining our county will not remain behind those northern counties, that have poured out so much treasure from gravel banks. When water comes, several claims in different portions of the county will be put in active operation, which, with proper appliances, cannot fail to pay handsomely. The gravel here prospects equally with that of other places, where this kind of mining has been very successful. The old way of working must give way to a system that reduces the banks many times faster. Our townsman, Caleb Dorsey, Esq., who has prospected in the gravel range beyond Garrote, is preparing to work on the largest scale this winter; he is making new and repairing old ditches, putting in tail races to empty into the Tuolumne river, building extensive flumes, getting new pipes and all of the most approved appliances known. He expects to have every thing ready by the first of November, and expects the outlay to be from \$25,000 to \$30,000. He will have a pressure of 200 feet, with a bank of gravel ranging from 75 to 200 feet in depth, that prospects, as we are informed, equal to those claims that have become famous in the northern mines of this State. Last winter, with 84 feet as the highest pressure, but only an average of 60 feet, in prospecting, one run of 25 days cleaned up \$1,400; another run of 15 days yielded \$1,354. With the pressure now gained, Mr. Dorsey says that a pipe will do more than three times the work that could be done when prospecting in the winter. The claim is superintended by A. Catlin Cook, a practical man in every sense, who has had large experience in this class of mining for a number of years. He was formerly and for a long period a resident of this county, connected with water ditches and flumes. We have known him long and have implicit confidence in his judgment. He says there is no reason why this gravel bed should not pay largely; he expresses satisfaction with the prospects, and entertains no doubt of making the claim a very profitable one.

There can be no question that the old county will yet create a sensation when her gravel beds are properly opened, and our miners cannot do better than turn their attention in this direction. Soon as one claim is successfully worked it will be followed by many, many more.—*Union Democrat*.

**THE MCCrackIN COUNTRY.**—We learn from Mr. George R. Ammond, manager for Allen & White, the contractors for constructing the new 20-stamp mill on the Sandy, three miles south of Greenwood, that the machinery for the mill is now at Aubrey, and will soon be landed on the site where it is to be erected. Mr. Ammond contracted some time since, with Mr. George W. Curtis, of this town, for the lumber, some 150,000 feet, and is now here for the purpose of contracting for freighting the same to Greenwood. Owing to the continued dry weather no grass has grown in that section this season, consequently work cattle and mules have to be fed entirely on tame hay, grown on ranches in that vicinity. A new road is now being opened from the sink of Date creek, nine miles below Gilson's ranch, by one of our most enterprising freighters, Mr. J. M. Bryan, who is taking in barley from Salt river to Greenwood for the use of his teams, which are employed hauling ore to the Greenwood mill for the McCrackin company. The road when completed will be free from rock, of easy grade, and water and grass plenty, therefore we apprehend that Mr. Ammond will have but little trouble in finding freighters. The Signal mill, owned by Leet, Ewing & Co., is nearly finished, and will soon be doing its work on ore from an extension claim of the celebrated McCrackin lead. The old Greenwood is still pounding away, and the yield is about \$40,000 per month, with thousands of tons of rich ore in sight, and the general outlook in the Sandy country never was better than at present.—*Arizona Miner*.

**MINERAL HILL.**—The lowest workings at Mineral Hill have only as yet attained a depth of 180 feet, and the enormous returns in former years from that locality all came from surface deposits. All the miners who reside and work in that locality are firm in the belief of the existence of a ledge at a greater depth, and have the utmost faith that future operations will prove the correctness of the theory. Its probable pitch is gravely discussed, and heated arguments often ensue as to whether it dips to the east, or will turn to a westerly inclination as the vein is explored. If Captain Plummer receives the necessary instructions, and he is daily expecting them, the diamond drills will soon be set to work, and the question settled beyond any further dispute. If the miners' theories are correct, the little town on the hill has a lively future before it.—*Eureka Sentinel*.

**NOTE ON THE STRIKE.**—Of the 104 locomotives burned in the roundhouse of the Pennsylvania railroad, at Pittsburgh, 50 have been pronounced worthless except for scrap. The remainder will be sent to Altoona for repairs.

## Wild Rose District.

A correspondent of the *Coso Mining News*, writing from Wild Rose, Inyo county, says:

"Having looked in vain over the columns of the *News* for some news or information regarding Wild Rose, that youthful bud of the Panamint range of mountains, and having despaired of ever receiving the much-desired information, I concluded, in that event, that as Wild Rose undoubtedly would not come to me, I would necessarily have to go to Wild Rose, and here I have been ever since. And it seems the longer a fellow tarries here the better he likes Wild Rose. But really, to be candid, it is not surprising that such should be the case, when we take into consideration its beautiful and picturesque location and its surroundings; situated as it is, in a beautiful and luxuriant valley on the Panamint range of mountains, 28 miles distant, almost in a due line east from Lookout, and connected therewith by a well graded and appointed road in every particular; and from Panamint, in a bee line, about 12 or 14 miles, and lying at an elevation of 10,000 feet above the sea level. The climate is unexceptionable; in the day time the thermometer ranges from 60 to 70 degrees. The nights are very cool, so much so that you can sleep delightfully wrapped up in two or more of the heaviest double blankets. It is a matter of much surprise to me that this delightful little country valley is not overrun with tourists and pleasure-seekers during the heated season, and thus avoid the sweltering and debilitating weather so common outside of this favored Eden. The hills and canyons here are thickly wooded with beautiful trees of that class of wood commonly known as nut-pine, cedar and juniper. The latter tree is very luxuriant in its growth, and serves as a very beautiful shade tree. Game is plentiful, but of the smaller class, embracing the jack rabbit, quail, doves, etc., and, I may mention, an over-abundance of coyotes and the wily fox, which fact necessitates rather elevated roosts in the poultry yards, of which there are not a few.

The founder of this romantic little town was James Honan. When Panamint died that natural death that I fear has no waking, Honan, Arab-like, folded his tent and silently glided over the mountains and in here. He subsequently entered into a contract with the Modoc company to furnish them with all the wood they required for a definite time for the smelting of their ores. However, the greatest difficulty that he and this camp had to overcome was how to obtain a good supply of fresh water. But this barrier was soon overcome by the pluck and indomitable perseverance of Honan, combined with that all-powerful lever, "the almighty dollar." So that we can boast of as good a supply of as pure fresh water as there is in the country.

The hills and mountains hereabouts are, beyond question, rich in the precious metals, particularly in that of silver, although I have been shown rock taken from ledges here rather richly impregnated with gold, leading me to believe that the time is not far distant when there will be developments made here in the line of mines and mining that will cast into the shade any and all similar efforts made within this country.

August Hoeltze, a Prussian by birth and an experienced and practical miner, who arrived here from Arizona but recently, which latter place he has been a resident of for years, prospecting and mining alternately, is now occupied in working a ledge that he recently discovered, about two miles from here. He is in company with a party by the name of McDonald, also a miner of no mean caliber. I have been shown some of the rock that they have taken out of the tunnel and shaft, which are only in about 20 feet as yet, and I have no hesitation in stating that it looks well, if not actually rich, and, I suppose, would assay at least \$500 per ton.

Mr. C. Wiser, a noted expert on anything and everything relative to mines and mining, has been spending the summer here for the benefit of his health, at the earnest advice of his physician. He has devoted a considerable portion of his spare hours, and when his health would admit, to prospecting after the hidden treasure; it is almost superfluous for me to add, with marked success, if not wonderful. He informs me that he has located and recorded no less than 23 well defined silver-bearing ledges, some of which, he assures me, are unsurpassed in richness. It is his intention, as soon as his health will permit, to commence the working of one or all of them.

**CLAIM FOR SMELTING ORE.**—M. Seligman has filed a complaint in the Fourth District Court against the Coso Consolidated mining company to recover \$6,430. It is alleged that within the past two years the Cuervo mining company has been a legal corporation. At the request of the defendant the Cuervo company smelted and converted into bullion 479 tons of lead and silver ore, under an agreement by which the latter was to be paid \$23 for each ton of ore smelted; payment to be made at the completion of 100 tons. The 469 tons were smelted by March, 1876, and the defendant became indebted \$11,030 to the Cuervo company. Of that amount only \$4,600 has been paid. Before the commencement of the suit the Cuervo company sold and assigned the balance of the indebtedness to the plaintiff, who now brings action to recover.

## USEFUL INFORMATION.

## Making a Well.

There are some who find it convenient to make a well in the old way, although the boring and piping apparatus is of more general use. To such a hint from an article written for *Scribner's Monthly*, by Mr. S. W. Pinkham, will be of assistance to preserve the water from insipid drainage or surface flow: "First, of course, the well must be so constructed that it cannot act as a drain for the neighboring soil. This can be done by making the wall above low-water mark of some material impervious to water, or by omitting this part of the wall altogether. The first can be accomplished by having the wall from a point two or three feet from the bottom made of brick with a coating of hydraulic cement on its exterior, or of hydraulic well-tubing with the joinings well protected with cement; in either case the earth should be thoroughly packed around the wall, and a slight embankment should be made around the orifice to prevent the in-flow of surface or storm water.

"In such a well the draining surface is so reduced, and placed at such a distance below the surface of the ground, that in the great majority of instances the introduction of foreign matter becomes impossible, except in so far as there is a chance that substances will fall into the well from above. To prevent this the well should be kept covered when not in use. In most cases, however, it is better to omit the upper part of the wall altogether. After the excavation is completed, the wall can be built in the usual manner for a distance of two or three feet, more or less, as circumstances may demand; the service pipe can then be placed in position, and the wall arched over. The remainder of the excavation can then be filled with earth, well packed as it is thrown in, and the pipe carried to any convenient point. It will be necessary to place above the arch several layers of stones successively smaller to prevent the falling of the earth into the space below.

"The workmen will probably suggest a layer of turf or straw to accomplish this object, but the presence of either of these substances will cause the water to be unpleasant for a considerable time, and will prove the cause of much annoyance.

"There is a prevalent notion that a well should be ventilated for the purpose of allowing noxious gases to escape, and that water is better for being exposed to the air. I hardly need state that the only noxious gases in a well (i. e., gases which render the water unwholesome) are the products of the decomposition of organic matter which has found its way into the well in ways which have been described above, and that water, as it flows in its subterranean passages is more perfectly aerated than it can be in any other way."

## Postal Law Shams.

A writer in the "Contributors' Club" of the *Atlantic Monthly*, for September, exposes what he calls the sham of postal laws, which discriminate between authors' manuscripts intended for publication in book form and those offered as contributions to newspapers and periodicals, illustrating the result as follows: "We authors write about 25 magazine articles each a year. Postage (letter rates) average 40 cents on each article—ten dollars a year for each of us. There are \$48 authors in the country who write for magazines. Most of our articles are not accepted, but are returned to us. We pay postage just the same, though, both ways. Considering, for the sake of argument, that we use the mail and not the express, our postage on matter sent aggregates \$8,480 a year; return postage on upwards of two-thirds of our work hurled back upon our hands, say \$6,000. Aggregate for the year, \$17,480. Aggregate for three years, say, in round numbers, \$43,500. Among us, in this country, there are 441 who write books as well as magazine articles. But we do not write a book every year; we average a book each every three years. That is an aggregate of 441 books in three years. Postage on each book (as authors' manuscript), an average of 20 cents. Now observe: Aggregate postage (letter rates) on three years' magazine manuscripts \$43,500; aggregate postage on three years' book manuscripts (authors' manuscript rates), \$88.20."

**KILLING ANTS.**—Fruit growers, gardeners, and, in short, men of every business, in some parts of this State, who have land enough for an ant-hill, are grievously afflicted with these pests. A Texas correspondent of the *Journal of Chemistry* relates his experience and treatment as follows: "We find flooding with water the most effectual means of destroying them, and too often the most impracticable, for two reasons: First, because these creatures with the spent leaves and earth hank up their holes so as to ward off the water (if there should be a knoll in the field it is sure to be an ant-town); secondly, because of the scarcity of water. We cut deep channels towards the ant-towns, so that when the rain comes it may run along these ruts and flood the ants, but it is frequently a laborious and often an impossible method. Our nurseries contain some 60 acres, and on this space alone we annually use \$100 worth of cyanide of potassium as ant poison. We dissolve three or four lumps about the size

of marbles in a gallon of water, and every morning and evening pour three tablespoonfuls of this mixture into the various working holes. The fumes kill all the ants that cross it for an hour or two; still it only keeps down their numbers, and never completely eradicates them." Any of our readers who wish to try the Texas remedy must remember that cyanide of potassium is one of the most virulent poisons, and should be most carefully handled and used.

**TANNING A LAMB SKIN WITH THE WOOL ON IT.**—Make a strong soapuds, using hot water; when it is cold wash the skin in it, carefully squeezing it between the hands to get the dirt out of the wool; then wash the soap out with clean, cold water; next dissolve alum and salt, of each half a pound, in a little hot water, which put into a tub of cold water sufficient to cover the skin, and let it soak in it over night, or 12 hours; now hang the skin over a pole to drain; when well drained spread or stretch carefully on a board to dry. It need not be tacked down if drawn out several times with the hand while drying. When yet a little damp, sprinkle pulverized saltpeter and alum (an ounce each mixed together) on the flesh side, rubbing it in well. It is now to hang in the shade two or three days, the flesh side in, until perfectly dry. When entirely dry, scrape the flesh side with a blunt knife to remove any scraps of flesh. Trim off all projecting points, and rub the flesh side with pumice or rotten stone, and with the hands. Prepared in this way, it is white and beautiful, suitable for a door mat, and also nice for the feet in a sleigh or wagon in cold weather.

**BURNING GARBAGE.**—The process of cremation, says the *American Architect*, suggests a means to solve the serious question, what shall be done with the street refuse and garbage. An analysis of collections from 13 representative districts give the following average results: Water, 3.032%; nitrogen, 0.369%; combustible material, 28.454%; incombustible material, 68.514%. Prof. Chandler, President of the Board of Health, suggests a system of garbage cremation in furnaces similar to those in the manufacture of shell-lime. It is said that 200 tons of refuse and garbage can be cremated and rendered innocuous in 24 hours. Such a system would involve less cost than conveying it to deep water, and be far more consistent with the demands of civilization and public safety.

## GOOD HEALTH.

## Rendering Salt Meat More Nutritious.

Professor Robert Galloway has published a second edition of his pamphlet on a method for rendering salt meats more nutritious and thereby preventing scurvy. This, says *Public Health*, he believes, is to be accomplished in a simple and natural manner. He points out that certain substances go to form or constitute flesh; during the operation of salting the flesh some of these substances are removed and carried away in the brine, the chief constituent thus removed being phosphate of potash. It is evident that if this salt was necessary for the formation of the flesh in the first instance, its absence from it when salted cannot but be injurious. Professor Galloway therefore recommends that it should be used with salt meat either at or before the time of eating. He claims for his idea an analogy with the plan adopted by human beings in every quarter of the globe of eating common salt (chloride of sodium) with fresh food to make up the deficiency of soda salts required for the proper formation of the blood. Salted meat, argues Professor Galloway, is deficient in potash salts, and certain potash salts are required for the formation of the juice of the flesh; consequently phosphate of potash ought to be employed with salted meat as common salt is with fresh meat. The importance of phosphate of potash for nutrition, and indeed for vitality, has been proved by Pasteur and Mayer. In their investigations on the physiological study of fermentation, and the development of cellular organisms, they have shown that this salt is absolutely necessary, even for the development and nutrition of the yeast cell. This being so, what can be the effect of food deficient in phosphate of potash on man but malnutrition, or, in another word, disease? Some objectors have urged against Professor Galloway's plan that although true in theory, it would not succeed in practice, because the phosphate of potash would not be assimilated. His reply—and a very sensible one—is, it is sufficient to know that common salt is assimilated to believe that a like result would attend the use of phosphate of potash. Other objectors who have objected to his theory have declared that it is the citric acid in potash which prevents ordinary food from producing scurvy. Professor Galloway's answer is that the blood and juice of the flesh can no more be formed out of food deficient in one or more of the necessary constituents for their formation than bone can be formed without phosphate of lime. The beneficial effects of lime juice in the prevention of scurvy are, Professor Galloway thinks, due to the presence of the potash and phosphate it contains; but he admits that this view was doubted by the late Dr. Parkes. It is certain, however, that neither Dr. Parkes nor any other medical man has yet explained the beneficial action of lime juice, and it is equally certain that its administration is distasteful to many sailors. It certainly would

be much the more rational and pleasant plan to take phosphate of potash with the food than to take, some hours before or after, a dose of medicine having for its purpose the same object.

**THE WRITER'S CRAMP.**—A paper read by M. Bonilland before a recent meeting of the French Academy of Sciences gives an account of his further researches relative to lesions of the brain. In his former communications he demonstrated that the loss of speech was due to a malady of the third convolution of the left anterior lobe of that organ. He now goes further, and asserts that the three faculties which essentially distinguish man from other animals—speech, reading and writing—are each controlled by separate portions of the brain. In his researches he discovered that the paralysis of one of those functions could exist without the others being affected, and he gives as an example a case in which he was called to a consultation on a young man whose avocation compelled him to write continually. At first the patient had felt a slight weakness in writing, then a great difficulty; and finally, an absolute loss of the faculty. The result of the closest examination could not detect any defect in the muscles of the arm or hand, the latter retaining all its sensitiveness and power for every other purpose than that of writing, and all his other functions being normal and in good condition. The conclusion arrived at was that the source of the infirmity must not be sought for in the external organs, but in the center itself of nervous action—the brain. The young man was advised to learn to write with the left hand, which he rapidly succeeded in doing. The defect from which he suffered had long been known as writer's cramp, just as the loss of speech was for centuries termed paralysis of the tongue. Both designations were equally erroneous, both being now attributed to maladies of certain portions of the brain.

**HEAD TO FOOT WASHING.**—At the recent Domestic Economy Congress, held at Birmingham, Mr. Edwin Chadwick, C. B., said the effect of cleanliness was not sufficiently recognized. He found evidences of its effects in various ways. Dealing with the animal creation, he said the pig that was washed would put on one-fifth more flesh with the same amount of food than the pig that was unwashed. The same effect was observable in other animals. They had seen the horse washed from head to foot to give it additional force. The same argument applied to the human creature. He knew the case of an army hemmed in by the enemy and put upon half rations. They were regularly washed, and it was found after a time that the men who washed were equal in force to those who were unwashed and put upon full rations. Head to foot washing was not only important in the matter of economy in food, but also for the prevention of contagious disease. Nurses who attended scarlatina cases and other cases of contagious disease had found out that, by washing twice a day, and sometimes by changing their clothes, they might withstand the dangers resulting from the practice, and doctors who were similarly engaged had come to the same conclusion. As a defense against an outbreak of epidemic disease he would have the whole population washed. He mentioned that in a prison containing 1,200 persons washing was enforced, and instead of using 70 to 80 gallons of water for each bath, and causing a large expenditure of time, a very simple method was devised for giving the prisoners a thorough good bath. Each man was placed in a recess, with a spray of tepid water overhead, which completely cleansed him. Schools at which unwashed children attended were centers of children's epidemics.

**THE USES OF THE LEMON.**—As a writer in the *London Lancet* remarks, few people know the value of lemon juice. A piece of lemon bound upon a corn will cure it in a few days; it should be renewed night and morning. A free use of lemon juice and sugar will always relieve a cough. Most people feel poorly in the spring; but if they would eat a lemon before breakfast every day for a week,—with or without sugar, as they like—they would find it better than any medicine. Lemon juice used according to this recipe will sometimes cure consumption: Put a dozen lemons into cold water and slowly bring to a boil; boil slowly until the lemons are soft, but not too soft, then squeeze until all the juice is extracted; add sugar to your taste, and drink. In this way use one dozen lemons a day. If they cause pain, or loosen the bowels too much, lessen the quantity and use only five or six a day until you are better, and then begin again with a dozen a day. After using five or six dozen, the patient will begin to gain flesh and enjoy food. Hold on to the lemons, and still use them very freely several weeks more.

**WHOOPIING COUGH.**—It is some years since Letzerich affirmed that whooping cough was due to a special fungus. The assertion has been lately confirmed by the researches of Tschamhor. In the spittle of children who are suffering from the cough, there are little corpuscles, about the size of a pin's head, of a white or yellowish color, which pass through a series of characteristic changes, and which seem to be identical with fungi which are found on the peel of oranges, apples and some other fruits. By inoculating rabbits with these fruit fungi, and by causing men to inhale them, Tschamhor produced convulsive coughs of many days' duration, with all the characteristics of whooping cough.

## Subscription and Advertising Rates:

ADVERTISING RATES.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	\$ 2.00	\$ 5.00
Half inch (1 square).....	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.  
Subscription in Advance—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, Sept. 22, 1877.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—The Thermoscopic Lubricator; Importing Quicksilver; Academy of Sciences, 177. The Week; A New Method of Coating Substances with Copper; The Stereometer; Sunlight Printing, 184. The Grand Prize Mine; James's Single-Track Locomotive; Mining Suits; Patents for Mining Claims, 185. Our Paper Mills; New Incorporations; About Printing Inks; The Union Iron Works; Salamander Pelting, 188.

**ILLUSTRATIONS.**—Tyne's Thermoscopic Lubricator; Thermoscope Expanded by Heat, 177. James's Locomotive for One-Track Railways; End View of Locomotive, 185.

**CORRESPONDENCE.**—Notes from Colorado—No. 1, 178.

**MECHANICAL PROGRESS.**—Captain Eads's New Dredge; The Resistance of Ships; Hints on Joining; Still Talking Keeley; A Mechanic's Labor and Reward; Reviving, 179.

**SCIENTIFIC PROGRESS.**—Mineral Growth Again; A Deep-Sea Sounder; The Flesh of Fruits; Practical Instruction; American Plants Abroad; Fluid Carbonic Acid in Rocks; Mr. Ruskin's Cabinet, 179.

**USEFUL INFORMATION.**—Making a Wall; Postal Law Shamer; Killing Ants; Tanning a Lamb Skin with Wool on it; Burning Carriage, 183.

**GOOD HEALTH.**—Rendering Salt Meat More Nutritious; The Writer's Cramp; Head to Foot Washing; The Use of the Lemon; Whooping Cough, 183.

**MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 180.

**MINING SUMMARY.** from the various counties of California, Nevada, Arizona, Idaho and Utah, 181-188.

**MISCELLANEOUS.**—Methods of Mining at Mineral Hill; Salmon City Mines, Idaho, 178. Bedrock Flumes; Timber for the Mines; A New Tunnel Project; Gravel Mining in Tuolumne County; Mineral Hill; Note on the Strike, 182. Wild Rose District; Claim for Smelting Ore, 183. Iowa Hill Gravel Claims; An Improved File Holder; Industry Illustrated; Taxidermy at the Fair; An Oregon Mining Ditch, 186.

**GENERAL NEWS ITEMS** on page 189 and other pages.

## NEW ADVERTISEMENTS.

To Watch Speculators, J. Bride & Co., Clinton Place and No. 11 Eighth Street, N. Y.; Terrill's Underground Meter, 89 Dey Street, N. Y.; Miners, Attention! Richard Hoskin, Dutch Flat, Cal.; Assessment Notices—Mariposa Land and Mining Co.; Fresno Quicksilver Mining Co.; Delinquent Sale—Dolores Consolidated Mining Co.

## The Week.

The week has been characterized more by a spell of exceedingly warm weather than by anything else. Of mining news there is nothing of startling import. The principal excitement in connection with mining matters was the difficulty between Ford, the deposed Secretary of the Ophir, and J. B. Weller, the President of the company. Ford assaulted Weller on the steps of the International Hotel. Col. Weller has a few welts across the face, but otherwise he was not hurt. The cause of the attack was the recent removal of Ford from the office of the Ophir, on a charge of embezzlement, and his subsequent arrest—all of which was brought about by Weller's investigation of the affairs of the mine. As far as the mining share market is concerned, there is very little doing, and fluctuations are slight. The State fair at Sacramento opened on Monday last and was continued through the week. The close of the week will also hurry the close of the Mechanics' fair, which has had a most successful season. We have given a pretty full report of everything of interest in connection with this exhibition, which is one of great importance to the coast.

THE Elko Independent asserts that the terms of a compromise between the Comstock mine owners and the Suto Tunnel company has been agreed upon between all the parties interested, except one of the partners in the Bank of Nevada firm.

## A New Method of Coating Substances With Copper.

Mr. Kustel, the well-known metallurgist, has devised a new method of coppering cast and wrought iron, steel and brass without the aid of galvanic batteries. The usual way of coppering iron, without the aid of a galvanic battery, is, in respect to durability, very imperfect. Articles coppered in this way cannot be cleaned by rubbing, as the very thin coating would come off. The diluted solution of sulphate of copper (bluestone), with addition of sulphuric acid, does not permit the articles to be immersed longer than a few seconds, for the purpose of obtaining a thicker coating, otherwise the precipitated copper would not adhere. Other more proper methods to copper iron without batteries are not only too expensive, but hardly practicable on common ware like nails, tacks, spikes and the like, of which a great mass at a time could be coppered. Especially in this respect, and in regard to durable coating, Kustel's new method seems to be the only one that answers the purpose for the finest article as well as for the roughest.

Kustel's copper bath is easily prepared and not expensive. It consists of hyposulphide of copper-soda (2 NaO, 3 Cu<sub>2</sub>O, 5 S<sub>2</sub>O<sub>3</sub>, 5 HO), and is obtained by mixing a concentrated solution of bluestone with a concentrated solution hyposulphide of soda, both salts easily dissolved in water. It can be prepared, also, in the following way: In a hot solution of one pound of bluestone, a little less than two pounds of hyposulphide of soda salt is introduced and kept in motion by stirring with a wooden stirrer. If the yellow precipitate should get too thick, some warm water may be added. After all the salt is dissolved, and the clear fluid above the yellow precipitate appears green, some more hyposulphide of soda may be added, only so much that, when dissolved, the fluid should still show a yellow-greenish color. Too much of hyposulphide of soda would again dissolve the yellow precipitate.

The yellow mass is put into a filter of cloth or thin canvas, and, after the greenish water runs off, washed by pouring clean water into the filter, till it runs off nearly colorless.

The iron articles, whatever they may be, even large statues, after being perfectly freed from the oxidized surface, in the usual way, by diluted sulphuric acid, are washed in fresh water, and, if perfectly clear, introduced into wooden vessels conforming to the shape of the iron articles, or, if a great many small objects have to be coppered, in a revolving barrel, and so much of the yellow precipitate added as to cover the articles. A slow revolving of the barrel, or turning of the article, is necessary in order to change the touching points, and to get a uniform coating. After five or ten minutes the articles are examined, and, if a thicker coating is needed, the process may be continued a little longer. When ready, the articles are taken out, washed several times in hot water, and quickly dried, etc.

As long as there is any of the yellow precipitate in the vessel, another set of articles may be charged, and, if the operation goes too slow, some more of the precipitate is added.

The coppered articles must show a bright copper color, which is sometimes increased by a small addition of carbonate of soda or a piece of cyanide of potassium. This process, being new, leaves space for improvement, which may be suggested only by longer manipulation. The copper adheres to the article, so that it might be polished with steel. A nail, after being in the bath for 15 minutes, can be driven through a two-inch plank without the least injury to the coating. The yellow precipitate, if dried, can be used advantageously as a coppering powder on finished articles like blades, etc., rubbing it wet with a piece of cloth. This improvement is a highly important one, from a scientific and industrial point of view. In the construction of vessels, boats, etc., all the iron work might now be coppered at less expense than galvanizing, and to much more advantage. In fact, coppered metal can be used for a variety of purposes where bare iron or steel does not stand well.

**CLAY-STREET HILL RAILROAD EXTENSION.**—The owners of the Clay-Street Hill wire cable road have a large force of mechanics and laborers employed in extending that road from Leavenworth street, the present terminus, to Van Ness avenue. The extension in distance is 2,000 feet, and the descent 200 feet. The cars will be running to Van Ness avenue early in November, but it will be necessary to suspend the running operations of the whole line for six or seven days prior to the completion of the extension. A. S. Hallidie, President of the company, reports that the speed of the cars will be increased ten per cent. after November 1st, and the number of cars and dummies also increased in a corresponding ratio. The additional power required will be supplied by two engines, each 36-inch stroke and 14-inch diameter of cylinder. The extension has been solidly built of the best materials of construction. Cast-iron supports joined together sustain the tube-rail and road bed. The total cost of the improvement will exceed \$70,000.

THE yellow fever has become epidemic at Fernandina, Florida.

## The Stereometer.

We were much interested in examining, this week, several appliances, designed by Mr. Chas. F. Butte-Caspari, C. E., late professor of mathematics and natural sciences at the University Mound College, for illustrating in a more complete and practical manner than by diagrams, various mathematical problems. One of these appliances, called the stereometer, is an entirely new thing, and one of great interest to teachers and students of mathematics. The stereometer consists of two frames, the upper one being a square, the sides of which are three feet long; and the longer one is formed by two such squares. Both frames are kept in position by four small columns, four feet in height, and standing on four legs, by which the whole is supported and fastened to a common table. In these squares graduated cross-bars (of any desired number) are fastened by screw-clamps. They move horizontally in two directions, parallel to the sides of the square, while similar bars, four feet long, are perpendicular to the frames and parallel to the columns. The cross-bars and framework are made in two pieces of one-half by one-eighth of an inch, leaving between them an open space of three-sixteenths of an inch, in which, again, a simple screw-clamp moves, holding a needle in position, perpendicular to the bars and frame. These needles are pieces of strong common wire, flattened a little on one end, with an oblong hole in the end. By this arrangement a mechanical way is found to determine the position of any point in space within the apparatus. The shifting of the cross-bars (say north or south), the moving of the clamp in the split of the cross-bars (east and west), and the moving up and down of the needle in the clamps, are true representations of the equations of a point in space. It is self-evident that the position of an unlimited number of points can be determined, and, consequently, any solid figure can be represented in contour lines by drawing wires—or, better still, elastic silk cords—through the corresponding points.

As long as straight-lined figures are required, these threads are an excellent means to represent the same; but all sorts of other solids, viz., cones, cylinders, spherical triangles, etc., can also be exhibited easily by using, in lieu of threads, strong brass wires bent to the curvature required.

Should it be desired to represent points and lines in the sphere, a skeleton wire globe of two feet in diameter is added to the apparatus, by which any problems arising in astronomy, geodesy, etc., may be easily shown by means of intersecting rings, kept in position by spring clamps, colored black and white as far as they represent given or required quantities.

We have seen several illustrations of mathematical problems on this apparatus, convincing us at once of its utility and importance. Within the space of the square a solid was constructed, representing the proposition that the frustum of any triangular pyramid is equal to three pyramids, having equal heights with the three bases: (1) lower base of the frustum, (2) upper base of the same, and (3) the mean proportion of both. The whole frustum and the four pyramids required appear in distinct shape, and exact, being so plain that the whole proposition is easily understood at once.

Another illustration represented conical sections and the relations of the hyperbola, showing axis major and the asymptotes. No other model can show these lines in their true positions, as they are lying in space and nowhere in contact with the cone itself.

The constructor of the stereometer claims that the adoption of light wire skeleton globes in place of the old solid globes will bring quite an alteration in the manner our nautical astronomy is at present handled; and we must say that we were rather surprised to find that the lunar distances, so very important and useful to nautical men, and hitherto considered so extremely difficult of solution, in his hands dwindled down to the most simple solution of a single spherical triangle. The common solid celestial globe has undoubtedly a great disadvantage—celestial bodies can never be produced in their true position. East and west changes with the concave in the convex form, and often confuses beginners. The skeleton globe gives both the concave and convex forms, and the position of points and lines is seen on both sides.

Another figure gave an illustration of the octahedron form of a crystal of sulphur. All the axes are seen, and the peculiar passing over from spherical to plane trigonometrical triangle calculation was clearly and comprehensively demonstrated. Here, again, no other kind of model could have given the same important result. While speculative geology and geognosy have been quite a fancy science of great interest, the most accurate scientific part of the same—crystallography—is very seldom made a special study. The stereometer will bring every beginner easily over the elements of this most important branch, and should be in the possession of every geologist.

The models scheduled by the stereometer are perfectly accurate and complete, representing not only the solids, but also all lines of construction, which very often lay in space far off from the solid itself. Thus, all questions arising

in spherical trigonometry, conic sections, astronomy, crystallography, etc., can be easily illustrated. The large skeleton models of the stereometer are minutely exact, and can be divided to any number of integral solids, each of them clear, precise and easily discernible.

Every teacher of mathematics, and every student of the science, has had more or less of the same difficulty in forming a clear perception of the true position of and relation of points, lines and planes in space, and very few have mastered this question. Solid models are insufficient; in many cases quite impracticable and very expensive. The simple contrivance described solves the problem better than previous appliances, and will be a great assistance in all schools where geometry is taught. Teachers or students can make any stereometrical construction in a few minutes. Dihedral or polyhedral angles are shown in their true position and size. Polyhedrons are represented on a very large scale, so that angles and lines can be actually measured, if such should be required for industrial purposes. To the lapidarian this instrument is of advantage, who has always had to apply great skill and long experience to find the most favorable form for large precious stones, which would lose considerable value by diminishing their size more than absolutely necessary. With very little trouble, the stereometer will exhibit a series of shapes, all lying within a fixed space, the magnified size of the crude gem, from which the most effective or most favorable shape can easily be selected.

This stereometer is the first, and, as far as we know, the only instrument constructed by which the construction of models of solids is possible. Its value is self-evident. For class-rooms of universities, or advanced schools, it would be extremely useful, as they can be made of a size sufficient to be distinctly seen by all in a large room.

## Sunlight Printing.

We noticed, the other day, receipt of a map of the Suto tunnel ground, etc., showing certain details, and have since received a more perfect one, in which is embraced considerable more information than the previous one. The map contains all data which may be in any manner interesting, such as the water flow in miners' inches, temperature of air in header, number of holes drilled, aggregate depth of holes drilled, pounds of giant powder used, number of car loads removed, drills sharpened, formation of rock, different sizes of header, the header timbered and not timbered, the monthly progress in feet, total length, depth of shafts, number of working rock drills, etc. All these figures are given for each separate month during which the tunnel has been in progress. The monthly progress is shown by white and blue spaces alternately, so that one can see at once the varying progress for different months connectively. The map gives in a small space all information of this kind about the tunnel. A small map in the corner of the main one gives also the situation of the tunnel with respect to the Comstock lode, depth of connecting shaft and plan of the town of Suto, etc.

This profile work is printed by a process new to this coast, and called sunlight printing. This method will multiply drawings, maps, etc., and is a useful one for civil engineers, draughtsmen, foundries, railroad companies, etc., as it is simple and inexpensive. Copies taken in the usual way, that occupy several days to finish, may be completed by this process in a few minutes. From an original drawing as many copies as are needed may be taken without destroying the original, which may be made on common drawing paper in common colors; the thinner the paper the more opaque the drawing and the quicker and finer the sunlight proofs. Messrs. Kirchhoff & Specht, who printed the map referred to, showed us some very fine copies direct from printed originals. The sunlight printing can be made on any kind of drawing, writing or book paper, or on wood, linen, iron, leather, etc. Any person may use the process who chooses. An apparatus may be purchased, with paper, from Kirchhoff & Specht, and copies of drawings, etc., made with slight expense or trouble. The apparatus costs from \$20 to \$75 according to size, and the paper 15 cents and over per sheet.

The time required to produce these sunlight copies is from five minutes to an hour and a half, according to the thickness of the paper, and the sunshine. The gentlemen named produce these prints, also, if parties desire copies without troubling themselves to make them. The common sunlight prints are white on a blue ground; but blue figures can be made on a white ground, or even black figures on a white ground; but the latter requires more expense.

Lieut. Wheeler, who was recently in the city, and saw the process alluded to, intends introducing it in his office in Washington. An exhibition of drawings made in this manner is made in the Mechanics' fair, near the art gallery.

THE Point Arena News says: Petroleum has been discovered in a number of places in this vicinity in digging wells, but the richest prospect we have seen was struck in Jas. Underhill's lot this week. In sinking his well down deeper, he was discommoded by a large quantity of crude petroleum seeping through the rock into the shaft.

## The Grand Prize Mine.

The annual meeting of the Grand Prize mining company was held on Tuesday, when the following Trustees were elected: G. W. Grayson (President), M. Herman, (Vice-President), Henry Williams, E. M. Hall, and M. J. McDonald; Superintendent, S. Linkton; Secretary, R. H. Brown; Treasurer, Bank of California. The report of the Secretary shows the gross yield of bullion has been \$546,585.93. After deducting the discount amounting to \$55,460.51, and the express charge of \$6,263, it leaves a net balance of \$484,862.42. Of this amount the sum of \$222,502 has been expended for the erection of two mills, the hoisting works and supplies on hand at the mine and mill. There has also been paid the sum of \$8,558.39 on drafts of the Superintendent for supplies, \$7,857.03 cash on hand, and \$100,000 paid out for dividend No. 1, leaving a balance of \$145,944.44 as the working expenses for the entire year at the mine and mills. Add to this amount \$8 per ton for milling the ore already on the dumps, and it will make \$153,844.44 as the cost of mining and milling the 7,076 tons ore of extracted, being an average of \$22.49 per ton. According to the estimate of the Superintendent there are about 14,000 tons of ore in the mine above the third level; and, as all the dead work is done down to the third level, and all the ore is ready to be stoped out, the cost for extracting and milling it should be apportioned from that already worked, which would reduce the cost below \$20 per ton; and, from careful estimates, we are confident that the cost for extracting and milling the ore for the ensuing year will not exceed \$16 per ton. On the 10th of September the hoisting works were burned down, which has delayed work for a few days; but, by the 22d of the month, they will be replaced by new works, and the work of developing the mine will then go on as usual. The loss will be about \$10,000. In the meantime the mills are reducing the low-grade ore already on the dumps. The furnaces for roasting sulphuret ore will be completed on or about the 22d of this month, when the 20-stamp mill will commence the reduction of the ore from the third level. Although expending \$222,000 in machinery and \$100,000 in dividends, the mine has never levied an assessment. It was incorporated in September, 1876.

We take the following items from the report of the Superintendent, Mr. Linkton: At the time of the incorporation of the mines of the company the Grand Prize incline was down about 50 feet and the Ethan Allen incline was down about 70 feet—the inclines being 160 feet apart. Subsequently the Grand Prize incline was continued down to a depth of 70 feet and the Ethan Allen incline to the depth of 140 feet. From the bottom of the Grand Prize incline drifts have been run west 313 feet and east 97 feet, making a total length of drifts on the first level of 410 feet. About the 1st of October, 1876, the present main shaft was started.

The main shaft is now down 55 feet below the third level, and it has penetrated the ledge about three and a half feet. The shaft will be continued down to a depth of 120 feet below the third level, and then a cross-cut will be run north to cut the ledge. On the first and second levels the rich ore body is about 200 feet in length. The balance of the ore in the first and second levels shows an assay value of about \$50 per ton. On the third level the rich sulphuret ore extends the entire length of the drift, 449 feet. The total amount of ore extracted from the mine up to this date is 7,076 tons. Of this amount 5,297 tons have been reduced at the mills belonging to the company. Seventy-five tons were sent to Winnemucca, and 54½ tons of the sulphuret ore were worked at the Leopard company's mill; making a total of 5,426½ tons worked, which produced in bullion \$546,585.93, being an average of \$100.75 per ton. There are on the dumps at the mine and mills about 1,200 tons of low-grade ore, worth about \$50 per ton. There are also on the dumps some 450 tons of sulphuret ore, which is worth at least \$200 per ton. There yet remains in place above the second level, and extending below the second level a distance of 30 feet—to the point of contact with the sulphuret ore—about 3,000 tons of chloride ore, showing an assay value of about \$100 per ton, and about 8,000 tons showing an assay value of \$50 per ton. There also remains in place above the third level, and extending up 55 feet—to the point of contact with the chloride ore—about 3,000 tons of sulphuret ore, showing an assay value of about \$200 per ton. The shaft, at a distance of 55 feet below the third level, has penetrated the ledge three and a half feet, and is not yet through it, the ore being fully as rich as it is on the third level, which gives assurance that the fourth level will be as good as the third level is, and which will add \$1,000,000 to \$1,200,000 to the value of the mine.

We find a total value of ore on the dumps and in the mine above the third level \$1,455,000. Add to this the prospective value of the fourth level—say \$1,000,000—and it gives us a grand total of \$2,450,000. As the company has its own mills, all the above-mentioned ore can be extracted and milled at a cost not exceeding \$20 per ton. The company now owns one 20-stamp mill, recently erected, and one 10-stamp mill, comparatively new. They are now constructing two of Howell's roasting furnaces, capable of

roasting 40 tons per day. The furnaces will be completed about the 22d of September, when we will at once commence the reduction of our sulphuret ores from the third level. The hoisting works are of sufficient capacity to work the mine to a depth of 1,200 feet. Herewith you will please find an inventory of the property belonging to the company, and supplies on hand, which make an aggregate value of \$222,502.56.

## James's Single-Track Locomotive.

The locomotive illustrated on this page is designed to run on a single track of wood, of the dimension of 12x14 inches, including a top rail, 2 inches thick and 12 or 14 inches wide, to have a top dressing of asphaltum and other materials, or a strap of iron. The locomotive is supported by two broad-faced wheels, 12 inches on the face, with planed surface; one wheel as a driver, connected with the two cylinders, and the hind wheel (less in diameter) mounted in a frame that holds the lateral wheels, and framed into the rolling gear of a fifth wheel, allowing the locomotive to make any curve. The four lateral wheels (two on each side of the rail) impinge the side of the main stringer by the means of sliding boxes, that hold the vertical shafts of the lateral wheels, and are kept in contact with the side of the rail by elliptic springs above and below the box of each lateral wheel, as that will keep the wheels always in contact with the side of the rail, and follow the sinuosities or any deflection in the track, and accommodate themselves to any difference in the width of the main stringer. The vertical shafts of the lateral wheels will be extended up through the frame of the locomotive to receive a bevel-friction pulley, to come in contact with bevel-friction pulleys on the main driving shaft, to allow the driving power to be transmitted to them from the driver of the locomotive.

In order to ascend steep grades, the three vertical wheels on each side of the locomotive

JAMES'S LOCOMOTIVE FOR ONE-TRACK RAILWAYS.

are flanged, and only come in use at wagon-road crossings (and run upon iron rails only at the crossings) to carry the train and locomotive over the gap, which is accomplished simply by depressing the main rail to the crossing. The ends of the main rail at the crossings are leveled so that the main rail will receive the lateral wheels gradually, without any shock or jar. By the use of the six side wheels the locomotive can cross any other railroad, or run on any other railroad, as the vertical wheels are provided with flanges, and can be run on either a broad or narrow gauge by having the vertical or perpendicular side wheels the proper distance apart. The locomotive is provided with a powerful brake, that clamps both sides of the stringer, to hold the locomotive on any great descent, or stop it immediately, besides steel-hand brakes, that circle half the support wheels. The lateral wheels have also ridges that follow grooves in the main stringer, so

END VIEW OF LOCOMOTIVE.

that it is impossible for the locomotive to leave the track. The locomotive has twin tanks, that come down on each side of the main rail and under the firebox of the locomotive, that will assist in heating the water. The connection to the brakes that clamp the sides of the main stringer, and also the steel strap brake on the hind wheel of the locomotive, will be in the cab, so that the engineer will have full control of his engine.

This system of railroads is calculated to cheapen the cost of construction, and reduce fares and freights. It will be of great advantage in any country, and more especially where timber is cheap. This invention was patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, by David B. James, of Visalia, Tulare county, who may be addressed for further information.

Mr. James is the inventor of an improved system of one-railed railways, which we described and illustrated in September, 1876. The locomotive described above is intended for work on a railroad of this character.

## Mining Suits.

Frank McCoppin has filed suit in the Third District Court against Mark L. McDonald, and for cause of action alleges that on the 5th of March, 1877, the plaintiff placed \$5,000 in the hands of defendant to purchase certain mining stocks, the defendant agreeing to advance any sum over and above the \$5,000 that might be required, charging therefor reasonable interest and broker's commission; that the plaintiff ordered the purchase of the following stock, viz., 910 shares of Exchequer, 200 shares of Eureka Consolidated, and 500 shares of California; that defendant purchased said stock, advancing \$9,000 of his own money; said stock becoming the property of plaintiff, subject to the lien of defendant for the sum advanced, together with \$500 interest and \$70 commissions; that on the 12th instant the defendant disposed of the stock, which was worth \$20,000, and converted the proceeds to his own use. Plaintiff therefore claims that he was damaged in the sum of \$10,000, and asks judgment for that amount.

The action brought by Mrs. Catharine Kenney to recover \$2,000 from E. J. Baldwin was tried by jury in the 15th District Court. The story of the plaintiff, as given from the witness-stand, is as follows: Two years ago she kept a little store in Sacramento, and by the industrious use of her needle, and with the assistance of her mother and sister, a small fortune of some \$2,000 was collected together. A friend of hers, named Barton, being aware what money she had, suggested that it might be greatly increased by investing in mining stocks. He said that he was anxious to obtain a loan of money from Baldwin, and if she would put her money in the hands of the latter it would facilitate his negotiations for the loan. She declined to speculate in mining stocks, but had no objections to allowing Baldwin to use her money as his own for a time if he would guarantee repayment of the principal. The next day Barton brought Baldwin to her store and introduced

him. She came to San Francisco, and, according to agreement, called at Baldwin's office, accompanied by Barton. This was on the first Tuesday of January, 1875. Baldwin said it was a good time to invest money, and exhibited to her a list of mining stocks either of which was a good investment. Plaintiff positively declined to take any chances in stock, but said if he (Baldwin) would take the money and use it as his own for sixty days, he could have it; and if it made anything she would be thankful; if not, she would take her money back at the expiration of that time. Baldwin said he had no doubt but that he could return her two dollars for one within 30 days and asked her to return at that time. She called at the expiration of 30 days, when Baldwin said things had not turned out as well as he expected, and she had better call 30 days hence. She called as requested, and was informed that Baldwin had gone to Virginia City. Again she visited his office, and was told he was in the mountains; and on the third visit, she was informed that he had gone East. When the arrival of Baldwin from the East was announced by the newspapers she called at his office, accompanied by her sister and father, who is about 85 years of age. Baldwin did not at first identify her, and she reminded him of the \$2,000 transaction. "Oh yes," he remarked, "yes—you owe me four or five thousand dollars." "How so?" was the reply. "Stocks have gone down," said Baldwin. "But I did not invest in stocks. You took my money to use as your own, agreeing to return it in 60 days," said the confiding woman. Some further conversation followed, and she left the office. On a subsequent occasion, Baldwin told her she had better give him a receipt in full and trust to his generosity to reimburse her. She replied that she had trusted to his generosity once, and would not do so again.

Baldwin alleges, in defense, that he purchased 25 shares of Ophir on a margin for the plaintiff, at her request, for \$7,312, of which sum he paid \$5,349 out of his own pocket; that the stock depreciated greatly in value, and that the plaintiff refused to pay him the balance and broker's commission. He claims that she is indebted to him in the sum of \$5,349, and asks judgment for that amount.

It came out in Mr. Baldwin's testimony that while Mrs. Kenney's Ophir stock was going down so rapidly, he had several millions in the same stock, and was making about a million a month on his investment. He also testified that he is now worth between \$8,000,000 and \$10,000,000. The arguments were concluded and the case given to the jury. After an absence of half an hour, the jury returned a verdict in favor of the plaintiff for \$2,553.

## Patents for Mining Claims.

Miners are rapidly coming to recognize the fact that when they have a United States patent to their ground, they can much more readily dispose of the same in case they desire to sell. The fact that the ground is patented in a measure guarantees that it is worth something, as few people patent mines unless there are some developments to warrant it. Every month the list of patented mines increases, and this month Copp's Land Owner gives the longest list yet of claims patented since August. The mines are as follows:

## California.

Amador county—Michael Twohig et al. and McCauley, placer mine; Oak Hill copper mining company, Oak Hill copper mine. Calaveras county—Jacob F. Myers, et al., Whiskey Hill placer mine. El Dorado county—L. C. Bateman et al., St. Lawrence, No. 2, quartz mine; Jas. M. Anderson et al., placer mine; I. C. Bateman et al., Guadalupe quartz mine. Mariposa county—C. D. O'Sullivan et al., Whitebeck quartz mine; C. D. O'Sullivan et al., Spencer quartz mine. Napa county—Pope mining company, Pope quartz and silver mine; Valley mining company, Valley quicksilver mine; Silver Bow mining company, Silver Bow quicksilver mine. Nevada county—John H. Edin, Spring Ravine placer mine. Placer county—Heirs of M. S. Page, placer mine; M. A. Wheat, Weske, No. 3, placer mine. Plumas county—Mammoth quartz mining company, Mammoth quartz mine; Ed. N. Hooper, Hooper Extension quartz mine. Siskiyou county—Oliver W. Goodall et al., placer mine; S. W. Clary, Ellis placer mine; Maurice Reener, Black and Caldwell placer mine; Jerome Beebe, Reinwald Company placer mine. Shasta county—E. M. Dixon et al., placer mine; Edward Sweeney, Hall placer mine; Emanuel Lewin et al., John Orr placer mine; John Price, Price & William placer mine; Laurent Ranzl, placer mine; Wm. T. Hyatt, Alhro & Brickford's placer mine; Michael K. Welsh, placer mine; Drury D. Harid, Bunker Hill placer mine; James Leary, placer mine. Trinity county—Morris F. Griffin, Bates & Varmater placer mine; Edward Enright, placer mine; Wm. Ware and Henry Hoenen, placer mine; Jeff Anderson et al., Sturdivant placer mine. Tuolumne county—Alexander Martin et al., Eureka quartz mine. H. F. Williams et al., Water quartz mine and mill-site company.

## Colorado.

Boulder county—Jemel Franklin, No Name lode; John P. Crotty et al., Idaho Extension lode; Henry Niekirk et al., Malvina lode; Mark Hathaway, placer mine; George H. Bachelder et al., Eureka lode; H. J. Debruyne, Prince Gold lode; Joseph Pleppier et al., Minneapolis lode; Archibald J. Vanderen, John Jay lode. Clear Creek county—Wm. G. Downing, Mormon lode and mill site; Wm. T. Chandler, Susquehanna lode and mill site; Jas. O. Stewart, Independence lode; John W. Dumont, Frank Blair lode; John W. Dumont, three claims on the Free Land lode; Wm. F. Doherty, placer mine; Thomas H. Thach et al., Cook lode and mill site; Argentine M. Co., Argus and Fortunatus lodes; Richmond S. M. Co., Star lode; Spencer H. White, John Paul Jones lode; Solomon Robinson, Mountain Ram lode; William R. Gosline et al., Erskine McLeod lode; Patrick Moulty, Jordan lode; Robert D. Morris et al., Ben Franklin lode and mill, etc.; William Mendenhall et al., Garro lode. Alpiene county—John Q. A. Rollins, Perigo lode; Quartz Hill G. M. Co., Gibson lode; Fred. T. Gooch, Perigo lode; Henry R. Wolcott, Dexter lode; United States G. M. Co., Gregory 2d and Gregory Extension lodes; Jos. Thompson, Gaston lode; Rochester City G. M. Co., Button lode; Mary F. B. Andrews, Wilbur lode; Quartz Hill G. M. Co., Stark County lode; Thos. E. Wheeler, et al., mill site; Belden & Fernal M. Co., of Colorado, George W. Ellery lode; King G. M. Co., Rochester lode; King G. M. Co., Notaway lode; Richard Mackey, Poca-houtas lode. Summit county—Boston S. M. Co., mill site.

## Montana.

Deer Lodge county—Jos. R. Walker, Alice and Valdemer lodes; Jefferson Gustavus and A. Kheru, placer mine and lode claim.

## Nevada.

Lyon county—Crowder M. Co., Crowder mine; Mennon M. C., Sheridan mine. Nyo county—Chorita M. Co., Comstock Trout mine. White Pine county—Alex. McKenzie et al., Pleiades mine.

## Utah.

Salt Lake county—Liberty E. Holden, Jordan S. M. Co. mine; John Barry, et al., Victor mine; Steven T. Mackalls, Wahoua mine. Utah county—Geo. Frey et al., Sunday mine; Miller M. & Smelting Co., first western extension of the Miller mine; Miller M. & Smelting Co., Lonto mine.

## Wyoming.

Thos. Ogg Shaw, Rawlin mine and mill site.

THE Grand Prize mine produced \$219,163 in July and August, the net product, after deducting discount and expressage, being \$195,151. The new 20-stamp mill got regularly to work on the 20th of July, and the 10-stamp mill started up on the 17th of July. Out of the above total, a dividend of \$100,000 was paid on the 10th.

### Iowa Hill Gravel Claims.

In our last issue we gave a condensation of a letter from Iowa Hill to the Dutch Flat Forum, concerning the gravel channeled of Iowa Hill, and here copy further items about the same locality from another letter by the same correspondent:

In my last letter I gave the details of our new territory of the Hogsback. Yet, although it is entirely a new field, extensive and promising in character, and naturally attracting at present the principal attention of residents and strangers, I must not allow it to overshadow other modern undertakings and improvements which I find among my mining friends in the upper section of the county. Making my headquarters at the Secret house, I find much in every direction equally worthy of notice, though less expensive and less pretensions than the operations at Hogsback.

The fact is, sir, the people of the Divide, as a general thing, are acting very nobly just now. According to our means, for we have no really rich men, and our population, which is limited, I believe it safe to say that more prospecting is going on at present in our section than any other in the county. The old sluggish inactivity so long prevailing, which induced us, as it induced Micawher, "to wait for something to turn up," has fortunately given way to a conviction that we must do something for ourselves before we can justly claim the aid of outside capital; and that conviction, thank God, is being carried out with commendable spirit.

It is right, therefore, that those hearing the hum of the struggle, whether by labor or money, for in the result there is no difference in the two, should be encouraged; it is right their operations should be described; it is right the world should know what they are doing, that when the day of prosperity comes we shall know exactly to whom honor is due.

We will again start off about a mile and a half southwest from the Secret house to Black canyon, where another new and extensive undertaking will be immediately commenced, called

#### The Bullacher Claim,

An old location, under a new organization. Mr. Bullacher, for many years a resident of Nevada county, has long held the controlling interest; but, unfortunately, associated with obstructionists and soreheads in the property, has never until lately been able to carry out his views. He has recently bought those parties out; got the property into his own hands, and formed a solid company of San Francisco men, who intend to push matters right along. There is considerable interest attached to this claim, and its thorough opening will be a matter of moment to us. The channel of which it is the outlet comes from Big Secret canyon, struck years ago by a Greek company, and known familiarly as the Whisky Hill channel. It was very rich at the inlet on Secret, yielding coarse gold in abundance; but the Greeks, with two exceptions, were a disorderly set, samples of that day, and finally over a six-ounce lump, got to fighting with knives and pistols, since which their claim has more or less lain in abeyance. In fact, the channel cannot longer be worked to advantage from Secret canyon as the rock dips right down. The old Bullacher company traced the channel carefully over Whisky hill to its outlet on Black canyon, where the same coarse gold was found, the dirt paying from \$6 to \$10 a day to the man with a rocker for a long time.

Then a small hydraulic was put up and a cut 40 feet long run with the same satisfactory results. Their money, subscribed for a larger rig, was improperly squandered by some of the company unknown to the others. Then came strife and dissensions and abandonment of work altogether. During these weary years, Mr. Bullacher has had a hard fight, but now he comes to the front again with a good company of San Francisco men to back him—by the way, that scores two for San Francisco in this section—to reap the reward of his sterling fidelity, perseverance, intelligence and determination. It is the intention of the new company to run a tunnel 400 feet, and afterwards, if found necessary, to keep up a powerful hydraulic, that the ground may be worked thoroughly and systematically for all that it is worth. In a case like this, where the ground is already tested, that is the proper way, for if a thing is worth doing at all it is certainly worth doing well.

A short distance from the inlet of this channel, on Secret canyon, to the northeast, is the

#### Index Claim,

Commenced this season by Wm. Van Vactor and some of the permanent employees on the canal, for the purpose of striking the same channel. They have strong and marked evidences of a large wash, which, after careful examinations, they conclude belongs to the Whisky Hill channel. They are in 100 feet, having probably 100 more to run. They have a handsome bank of gravel that prospects well, and the whole claim, being commanded by the branch of the canal in course of construction to Big Secret canyon, eventually will be put under the pipe.

Near the Secret house, not more than 500 yards to the south, another promising enterprise has been commenced this summer—that of opening the first quartz vein found in the immediate vicinity. It is called the

#### Rennyson Ledge,

And in which I have an interest. We sank

down some 10 feet during my visit, and found the vein large and well defined, but it is impossible to speak with certainty upon its further merits until further work reaches the vertical dip of the vein.

#### The Iowa Hill Canal.

I am happy to say the work on this undertaking, the main stay of our future on a large scale, is progressing well. The number of hands employed, white men and Chinese, is about 50, and I think they will complete doing all that is contemplated this season early in October. The object this year is simply to finish a branch ditch from Tadpole station to Big Secret canyon. When finished, on ordinarily wet seasons, this branch will give quite an additional amount of water and later in the season than heretofore, for Big Secret canyon undoubtedly commands an immense watershed. It will also confer other rights and advantages of great importance to the company hereafter.

#### An Improved Fileholder.

An article which is valuable mainly for its usefulness, if simplified without being made less effective, is improved. The fileholder illustrated herewith is an invention of this sort. Like the short horse soon carried, its operation is briefly described. Its merits, however, are not so quickly noted in words as observed by sight.

To file newspapers, or other printed matter, the round rubber hand is slipped over the inclined end of the upper bar into the notched end of the lower bar. With the lower bar resting on a table the upper bar is swung vertically or sideways, leaving the point for receiving the papers entirely unobstructed. The hinged ends of the bars, being rounded and held elastically, the upper bar is easily and naturally brought back to the right position, where it is quickly fastened by slipping the adjustable hand over the incline.

Among the advantages gained by this holder are the following:

It can be opened and closed quicker than others.

The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and hand accommodate and hold firm either a large or small number of papers.

Devoid of surplus material, it approaches nearer to hookhinding than other fileholders.

With less material, it is lighter and less cumbersome than other holders.

It has no protruding ends to tickle the reader's ribs; no sharp corners or metal parts for defacing furniture.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. Consisting of so few parts, the two strong rubber rings are the only portions possible to wear out. These can be replaced at trifling cost. The file is adjusted but 52 times a year for a weekly paper. A sample holder can be opened and closed 1,000 times without showing depreciation.

Having, as a publisher, considerable use for fileholders, the inventor could find none of the hundred different kinds patented or in use devoid of decidedly objectionable features. For this reason he adopted and used some of the simplest forms conceivable. After several years' use and repeated improvements, the device we illustrate has proved the best.

The patent was allowed in April, 1876, since which time many holders have been used, giving full satisfaction. About 100 have had constant handling in the Free Reading Room, Oakland, Cal., rendering full measure of satisfaction.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 56, 30, and 34 inches, inside measure.

From our own experience and the testimony of others, we do not hesitate to recommend this simple article as the best of its kind.

Patented by A. T. Dewey, S. F. Samples will be mailed from this office for 50 cents, postpaid.

WOODWORTH'S cottage, near which the "old oaken bucket" swung, is carefully preserved by a descendant of the poet. The bucket was sold long ago, but the clear, cold well remains.

### Industry Illustrated.

To every one the actual operations of labor have a fascination that even familiarity does not banish. If the spectator is even a workman of the same craft, he will stand and look on for some time to measure the amount of work done and compare it with the result of his own labor, or he will watch for anything new that may lighten the work, or render the article any better than by his own process. If unaccustomed to see such labor performed the interest is heightened by a desire to know just how the article is made and what the process is.

When the managers of the fair see this exemplified as it has been this year by the crowds of people who constantly surround the few mechanical operations shown in the pavilion, we should think they would make an effort to have more of our industrial enterprises thus illustrated. And exhibitors, too, can draw a good lesson from the same source. To be sure, it would hardly be possible to show the perpetual bay press in constant operation, nor much of the agricultural machinery, though one or two large blowers could be utilized in propelling the windmills.

To no one would the mere exhibition of Gordon's chain force have any interest were it not for the metal, fire and hoy at work there in the production of chain. And how long would any one stand around Neuman's silk exhibit were it not for the process of winding the cocoons there shown? The little engine and its train now holds hundreds interested where tens did not stop to look at it when sleeping on a block by the side of the main engine.

The coal oil stoves in operation are seen and curiously examined, while those idly standing to be looked at are casually glanced at and passed. And how much attention would be awarded to the Novato cider did not its exhibitors set it to work on the palates of the multitude?

Of course it would take room to do this, but it would pay every exhibitor to come as near as possible to showing just how he made his wares; or how his machine worked. If that could not be done, he might show the different stages of the operation. An example of what might be done in this way is shown by Mr. W. F. Palmer in his exhibit of mechanics' tools. He has in the extreme Market street end of the pavilion a fine collection of edge tools, polished and finished in superior manner, and right beside them the raw iron ore, pig iron, wrought iron, steel, etc. Then he shows the piece of iron of which a tool is made; first, cut off only, then shaped, welded ready for the steel, then united to the steel, then drawn out ready to temper and polish. All these gradations of labor he shows in connection with several different tools such as drawknives, chisels, adzes, etc.

We hope that this will be thought of at a future time, and that at our next fair the industrial pursuits and operation may be more fully illustrated.

#### Taxidermy at the Fair.

To the lovers of natural history the many specimens of stuffed animals, birds and reptiles contributed by Mr. Woodward, E. F. Lorquin, Blunt & Chapman and A. Yeoman, are a genuine treat, and may be studied for hours with both pleasure and profit. Until we have so studied them, we cannot form an adequate idea of the number of beautiful birds, etc., that the Creator has placed upon this earth to beautify and enliven its groves and hills, its meadows and plains. Mr. Woodward's exhibit of course, comes from the collection at his gardens, and is not for sale, but is nevertheless very complete and beautiful, and includes birds and animals from every clime. Among them we find the toucan from South America, that strange bird that is nearly all hill like a continental hotel; parrots from all parts of the southern hemisphere; wood-peckers to match every kind of wood known; cuckoos of different kinds, but all having the same habit of appropriating other birds' property; lyre birds whose tails are the only sign for their names; golden and silver pheasants, and birds of Paradise, male and female; and hundreds of others, common and uncommon, that takes a column of fine type simply to mention. Besides which in the same case are lion, jaguar, panther, hedgehog, armadillo, bear, seal, monkey, squirrels, etc., to the number of forty different kinds of animals; crustacea, reptiles, eggs etc., are also well represented, so that any one having taste or curiosity in this direction can spend much time pleasantly inspecting this one collection.

Passing to Blunt & Chapman's collection, or to that of Lorquin, we find many of the same birds and animals, put up for sale, and rather superior in finish and beauty. Not having been so long in case as the most of Mr. Woodward's specimens they look fresher, and not timeworn. Many of those familiar to our eye, are elegantly preserved both in position and proportions, and the colors preserved wonderfully brilliant. No one need go abroad to obtain taxidermists' skill, for these gentlemen fully evidence their adeptness by their exhibited specimens.

A. Yeoman also exhibits a few pieces of his own work, below our stand in the same aisle,

consisting of the California tree grey squirrels, owls, etc., that are exceedingly spirited and life like. The squirrels are very fine in position and expression. Children take great delight in looking at the latter, and one little cherub wanted to stay there all the evening to see if "dey won't hop."

#### An Oregon Mining Ditch.

The Oregon Sentinel says: Work on the Sterling water ditch is progressing rapidly. About 400 men are employed along the line, and the company expect to commence mining operations about the first of December. The estimated cost of the ditch is \$35,000. The company paid \$25,000 for their mining ground, and it will cost in the neighborhood of \$10,000 to purchase and place in position pipes and other operatives for mining purposes. This is one of the greatest mining enterprises ever undertaken in Southern Oregon, and its success is by the company considered certain. A steam sawmill was, a few days ago, transported to the grounds of the company to furnish lumber for fluming and other purposes. Southern Oregon is known to be rich in the precious metals, and for years has been awaiting the enterprise and capital of such men as D. P. Thompson & Co., of Portland, who have undertaken this mammoth work, and, with their characteristic energy, are pushing it to rapid completion. A happy consummation is devoutly to be wished, as it will not only advance the interests of the company, but the prosperity of the whole country. A brighter future is certainly awaiting this section in the unfolding of our undisputed natural resources. The attention of capitalists is turned thitherward, and our gold-hedged hills must again admit the sway of the miner, and yield their treasure to enterprise and spirit.

CHARCOAL KILNS.—Henry Allen, the well-known contractor of Eureka, has just finished a work of considerable magnitude at Hot creek, 22 miles from Tyho. Last summer he was employed by the Tyho Consolidated company to build 15 kilns, in which the company proposed to burn the charcoal necessary to supply their furnaces at Tyho. He finished the work about one week ago, and the company were delighted with his work, and paid him a high compliment on his skill and energy. Some idea of the magnitude of the work can be gathered from the fact that 600,000 bricks were used in building the kilns. They are oval in shape, having a diameter of 25 feet. Each one has a capacity of 1,400 bushels, turning out that quantity of coal to each charge, the operation consuming just five days. A great economy of time is gained by using the kilns, instead of burning in the old-fashioned way, and, as the company owns a vast quantity of wood in the immediate vicinity, they calculate on their fuel costing them about one-half of the usual rates. Mr. Allen kept a force of about 20 men employed at the work for about three months, and finished his contract inside of the time allowed him by the company.—Eureka Sentinel.

#### UNITED STATES

#### Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with Instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1896; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that But and Notice remained Posted on Claim during Time of Publication; Registered Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

#### Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Script; Pre-emption; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract From the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys Land for Pre-emption, List of California Post Offices. Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S. F.

SAMPLE COPIES.—Occasionally we send extra copies of this paper to those we believe would be benefited by subscribing for it themselves, or who are willing to hand the paper and speak of its merits to others. We call the attention of such to our prospectus and terms of subscription.

# DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

Office—202 Sansome St., N. E. Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditiously. Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted. Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing. The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

DEWEY & CO., Patent Solicitors.

## Canadian Patents for U. S. Inventors and Patentees.

One Patent now Embraces all the English Provinces in North America, including the Canadas and British Columbia.

It is only recently that the Canadian Government has granted patents to United States citizens. In consequence thereof the many immensely valuable inventions patented in this country are now patented in Canada. Patents are much sought for and are readily disposed of at fair cash prices. In our country about three-fourths of all manufacturing is based upon patents, especially in the New England States no manufacturing business of any consequence is started without being protected by such. Our neighbors across the border have not been slow in observing and learning that inventions and patents are the foundation of all prosperity in manufacturing purposes. Hence all our patents for labor saving and agricultural machinery and innumerable improvements in home comforts meet a ready market in Canada. Inventors and Patentees should therefore not delay to secure their patents in Canada; many good inventions are already pirated by Canadians, who, against law and right, appropriate United States inventions and have them patented in their own name. After a patent is granted it is extremely difficult to prove who is the first and original inventor. Therefore, inventors and patentees to be safe, you will have to secure your patents in Canada without delay. We have facilities for securing Canadian patents second to none. Our charges for securing Canadian patents are about \$65. A model is required.

Inventors and patentees! do not delay and lose your opportunity. Things may change. With model and description of your invention remit \$25, and we will prepare all drawings and documents and forward them to you for signature. In about 30 to 50 days we can return your Canadian patent.

DEWEY & CO.,  
Patent Solicitors, S. F.

SAN FRANCISCO, CAL., Jan. 23d, 1877.

MESSEURS DEWEY & Co.—Gentlemen: I received to-day my patent papers for my improved feed-boxes, which you have so kindly worked through for me, and I wish to add my testimony to that of your many other patrons as to your promptness and fair dealing in every respect. Thanking you for prompt attention to business in my case, I heartily recommend you to those in need of a patent solicitor, in preference to the many Eastern firms who flood this coast with their circulars and representations of cheap fees, etc. Again thanking you, I remain respectfully yours,  
J. O. JOHNSON.

## PACIFIC RURAL PRESS,

A first-class 16-page Illustrated Agricultural Weekly, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Send for a sample copy.

[Established 1860.]

# The Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS, SCIENTIFIC AND INDUSTRIAL MEN,

Is now in its THIRTY-FIFTH Volume. It has ever been, and will continue to be, the aim and object of the publishers to make the Press

A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of our editors and correspondents, to seize upon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and to place the same before our readers at the earliest day. It has been well said that

A Newspaper is a Window

Through which men look upon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop, and can know but little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress books are necessarily slow and behind the times. It is only through papers devoted to the specialty which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a laggard in the race.

The Value to the Community

Of such publications in disseminating important information, in checking useless and exploded experiments, and in instigating important enterprises, can scarcely be overrated. Through them the readings and observations of thousands are collected and collated, and brought directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of just the information he needs—an unbound book forever issuing but never finished.

Nowhere in the Wide World

Is such an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here, also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world,

Useful, Practical and Directly from the Field

Of labor. The mustiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of such help our editors will be able, during the coming months, to do more than ever in furnishing information which shall be

Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

Our Illustration Department

Will still always form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this have no need to be anything more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million," and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

SUBSCRIPTION—\$4 a year, in advance. Samples free to those who will assent to obtaining subscribers.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

Continued from Page 181.

peet mountain and vicinity are being received. The southern portion of the district is fast regaining its former buoyant aspect, and the business men and property holders in that locality are much encouraged at the outlook.

**THE HAMBURG SHAF**—Good progress is being made on the main shaft of the Hamburg mine. The contractors are sinking at the rate of three feet per day, and will soon finish their job. About 35 feet further distance will bring them to the 450-ft level, when connections will be made with the drifts from the Friday shaft.

**ESSEXITE CHARTER.**—The crushing of the Mineral Hill ores at the Lemmon mill was finished on Saturday evening, and the deputation have started for their homes, their pockets lined with a liberal amount of coin, the product of their summer's labor. We are informed that the boys are well pleased with their treatment by Messrs. Clark & Wallace, and state that all of the ores run through the mill returned a much higher average of bullion than they expected. Some of the rock worked over \$200 per ton more than the shippers anticipated, and every facility was extended to them in the way of sampling the ores as they passed through the batteries. The mill company guaranteed a return of 82% on all rock going \$200 per ton, and 80% on ores falling below that figure. The shipment was worked above this percentage, and everybody is satisfied with the results. We hope to see the boys again, and presume they will pay us another visit as soon as they develop a few more rich pockets.

#### HUNTER DISTRICT.

**THE HUNTER CO.**—Pioche Record, Sept. 15: From Mr. James Day, we learn the following particulars in regard to Hunter district: The Hunter Co. mining company, of White Pine county, a San Francisco and London incorporation, will start up a new 40-foot hydraulic fan mine about the 20th of this month. In the Crown Point mine, belonging to this company, a large chimney of ore has been followed a distance of 115 feet, commencing 100 feet below the surface. Its dip is to the south. This ore averages 250 ounces of silver and 17% lead. Assays from face on the first of month, 359 ounces. This company also owns the Vulcan mine, in which very important developments have been made recently, and six other mines, all of which are well developed ledges have already been opened, and the prospects for the camp are most flattering. He confidently expects it to rival the Comstock. Last June there were only 500 men in Tuscaraora. Now there are 1,500 and more coming. Business is brisk and all seem to have money. The only trouble is to obtain lodgings. The influx of men is so great that there are not houses enough to accommodate them.

#### TUSCARORA DISTRICT.

**A PROMISING CAMP.**—Gold Hill News, Sept. 14: Prof. W. Frank Stewart returned from Tuscaraora this morning. He says he has located enough mines since leaving the Comstock to make the whole country rich. He speaks encouragingly of Tuscaraora district, and says it is the only place left in which to get even. The mines there are showing up handsomely and giving employment to a great many men. Several well developed ledges have already been opened, and the prospects for the camp are most flattering. He confidently expects it to rival the Comstock. Last June there were only 500 men in Tuscaraora. Now there are 1,500 and more coming. Business is brisk and all seem to have money. The only trouble is to obtain lodgings. The influx of men is so great that there are not houses enough to accommodate them.

#### Arizona.

**MINING NOTES.**—Arizona Enterprise, Sept. 15: The news from the mines still continues to be of an encouraging nature, and work is rapidly progressing in the various districts. The Iron Horse, the north tunnel is now in the neighborhood of 400 feet, and will soon tap the shaft at a depth of 312 feet. There is no change in the character of the ore body, which is high grade.

**THE DOYLE,** which is also in Peek district, is one of the best prospects in that vicinity. The shaft is now down 35 feet and shows a two-foot pay streak of ore, going about \$200 to the ton. Work is temporarily suspended on the Silver Prince.

**HASSAYAMPA,** one of the most promising mines is the Perry, discovered a few months ago, and located by Messrs. H. Leighton, J. A. Park and T. Otto. The tunnel is now in between 35 and 40 feet, and shows a well-defined pay streak of high-grade sulphide and galena ore. This mine is situated about eight miles south of Prescott, and is justly considered to be one of the best prospects in Hassayampa district. Work is temporarily—steadily progressing on the Silver Prince, and some very fine ore is being taken out, but the mill is shut down for the present, owing to the scarcity of water.

**THE CROOK** mill is also shut down for the same cause, but Taylor and Sheldenbrand are at work on the mine, and have some very fine ore out.

In Turkey Creek district, Dave Neagle has a force of men at work upon the Goodwin, and is now down 125 or 130 feet. The pay streak is widening as the shaft gets deeper. The new two-story mill will be on the ground in a few days. It has a good roaster and is complete in every respect. John Holmes is at work upon his location, and has some of the best ore yet found upon the Goodwin. Ward & Co., on the Peerslee, are now down about 60 feet, and have a good streak of high-grade chloride and carbonate ore. The shaft on the Trinity is down over 40 feet, and makes a better showing than ever. The pump, hoisting works, etc., are put up on the Tiger, and pumping has been commenced. So soon as the water is taken out, sinking will be commenced immediately.

#### Idaho.

**KNOTT'S MINE.**—Owyhee Avalanche, Sept. 15: The excitement in regard to the rich discoveries in the Black Jack mine, on Florida, still continues, and the prospecting continues the ledge grows larger, and the outlook continues more promising. It is one of the best defined veins ever worked in this vicinity, and the indications are that it will turn out to be an immense bonanza.

**GAMBRINUS DISTRICT.**—Idaho World, Sept. 11: The Gambrinus district is looking up. All the mines are being worked to the best advantage, and everything in that section presents a cheerful and active appearance. As a tip from Lu Bonnett rock was made at the Ploverman mill a few days ago, and the result was satisfactory. The next run in the Ploverman mill will be from the O'Neill ledge, which was proven by a crushing made last fall to be very rich. When that rock is crushed a run will be made from the Forest King, from which big results are anticipated. No rock, as yet, has been worked from that mine, it being a late discovery, but the prospects are such as to leave no doubt of the anticipated results. Robbins & Co. are sinking a shaft on the Golden Gate. The rock taken from the shaft is fully as good as that on the surface. They will sink the shaft to the depth of 60 feet, and then commence stopping. Mr. Ploverman is taking out good rock from the Magna Charta. He has put a whim on the Gambrinus mine for raising the ore through the old shaft. The Sub Rosa mill is working to a charming and successful result. The mine is looking splendid, and there is ore enough in sight to keep the mill running steady for months. Tinscher & Co. have commenced sinking a shaft on the Ida Poland, and are taking out good ore. The road to the mine is completed; also the branch roads to the other mines. The prospects in the district are indeed very encouraging. Ore from all the mines there, with the exception of those lately discovered, has been worked and found to be rich, results of from \$40 to \$300 per ton having been obtained; and as the rock contains nothing but free gold, it can be worked at a very low rate, custom rock being crushed for \$5 per ton. The newly-discovered ledges respect fully as well as those that have been worked.

#### Utah.

**BEAVER.**—Cor. Salt Lake Tribune, Sept. 15: The Frisco furnace is to be rebuilt.

The Shambles and Millford furnaces still remain shut down, and there is some talk of their remaining so until the first of January next, unless lead should take a big rise. The mines look encouraging and work still goes on. The tunnel being run from the Elephant mine is now in

nearly 250 feet, with good prospects of ore. This is one of the best paying mines in Star district.

The Wasco still continues to improve as it goes down. This is now the deepest worked mine in the district, and the ore is of good grade and smelts very easy.

**TRINITY.**—The mines in this district that are working are all doing well, and every foot they go down only serves to prove their growing richness.

The Crismon is turning out gold so fast that its little mill is unable to handle it, and there is some talk of increasing its capacity immediately.

The Shoebridge mill found that it had not drying capacity enough to handle the ore offered, and has been making extensive improvements in dry kilns and ore houses, and has none too much capacity now to handle the ore that will be produced this month.

The Consolidated Julian Lane mine is now working about 30 men, and is producing a large quantity of high grade ore. They have adopted the tribute system—that is, giving the men in small parties certain portions of the mine to work and have a share in the profits. It works well.

The Golden Treasure and Tesora, lying north of the Julian Lane, are both working good forces of men, and are producing a fine amount of first-class ore.

There are a great many smaller mines and prospects, owned by poor men in this district, on which the owners are doing such work as they can afford, and, as a general rule, they are paying for the labor expended on them.

**NEW STRIKE.**—Another rich gold strike is reported in the Crismon Mammoth mine, in Tintic. It is of the same character as the first strike, the rich streak being four feet wide, and runs up into the thousands, while the whole vein, the width of which we believe is not yet determined, samples \$600 per ton at the company's mill.

We understand that the owners of this valuable property have determined to erect a 20-stamp mill, between the present time and next spring, a site near the mine having been already selected. If this property ever falls into the hands of California men, it will become the wonder of the mining world.

#### Our Paper Mills.

Near our stand in the pavilion is a small but elegant exhibit of the productions of our paper mills, which industry is fast assuming a position of importance among our manufactures. We believe there are five mills engaged in the manufacture of this article in this State, whose capacity and location are as follows: Eagle mill, Point Arena, straw paper, 25,000 reams per month; Pioneer mills, Marin county, printing and manila paper, 65,000 pounds; Stockton mill, printing, 90,000 pounds; Saratoga mill, straw, 5,000 reams; Lick mill, Alviso, straw and manila, 5,000 reams. A large new brick mill is now being erected at Stockton for the manufacture of news paper, that is to have a capacity equal to all the foregoing mills combined, and is expected to be in running order about February next. It is to run on tule as a material.

Straw paper wholesales at about 85 cents per ream, and retails at \$1, though heavier paper rates at 15 cents more per ream. This manufacture utilizes a large amount of oat straw in Marin and Mendocino counties, where the most of this brand here used is made, which would otherwise be left on the ground to rot or be burned.

The process of making paper is quite interesting when seen for the first time. In brief, the materials are ground to a pulp, and then strained, and what is retained on the strainer is the paper. That is the way it appears to a novice, and yet this simple operation requires a great deal of complicated machinery that we have not space to explain here. Paper or papyrus has been known to writers for ages and ages, as even the ancient Egyptians made a fair article from the "tule" of the Nile. Our ancestors used mostly parchments made of sheepskins. In the early days of paper proper, only the best of material was used to manufacture it of; first linen, then cotton; now almost anything will do, as we use straw, wood, tule, cactus, many kinds of weeds, and almost any light-colored substance that can be pulped.

In the paper business of this city, Messrs. S. P. Taylor & Co. take the lead in handling the home-produced article, and are agents for the most of our mills. With so much competition in this business the profits of the smaller mills have been very light to manufacturers, and some of these mills have repeatedly changed owners on account of exhausted bank accounts. Now the price is very low, but the falling prices of labor are assisting the proprietors of the mills, so that they are still enabled to run. Messrs. S. P. Taylor & Co. have a large establishment at No. 416 Clay street, well stocked with all grades and varieties of printing, straw, Manila, and wrapping papers, as also blank hanging paper, paper bags, etc., and supply any order at short notice. They can always fill the largest order at a comparatively short notice, even if they have not in stock a shipload of it. Prompt attention to business, fair dealing, and moderate demands for profit, have made them popular with producer and consumer.

They make a small but elegant display of blank hanging papers in rolls, printing paper, straw, manila, and colored wrapping papers, near our stand in the pavilion, and might fill all the space that could possibly be accorded them with specimens of different kinds, but it was considered needless.

#### New Incorporations.

The following companies have filed certificates of incorporations in the County Clerk's office, at San Francisco:

**SOUTH STANDARD M. Co.**—Sept. 18th. Location: Bodie district, Mono county. Capital stock, \$5,000.00. Directors—C. C. Stevenson, C. H. Golding, Wales L. Palmer, Israel W. Knox and C. A. Sankey.

**OLIMPALE S. M. Co.**—Sept. 18th. Location: Nevada. Capital stock, \$10,000.00. Directors—M. R. Roberts, M. G. Cobb, I. P. Rankin, J. P. H. Wentworth and L. Francis.

**SHAWMUT M. Co.**—Sept. 17th. Location: Inyo county. Directors—Z. E. Spaulding, T. J. P. Lacy, D. H. Ward, J. W. Ward and J. T. Ward.

#### About Printing Inks.

The perfection to which the typographic art has been carried in this country is one of the notable things which mark the present age. The improvements in printing presses, in type, stereotype and electroplate, wood engravings, etc., have been heralded through the public journals until every one who feels any interest in the progress of mechanical and artistic work is acquainted with them; but there are some of the accessories to fine typography, usually looked upon as secondary in importance, which are really essential to the production of work of a superior character. The most costly presses, the finest type and wood-cuts, the handsomest paper and the greatest skill on the part of the printer, will all be in vain if the ink used be of an inferior kind, and all persons familiar with this great art know how to appreciate fine ink.

Very few people have much idea of the method of manufacture of printing ink, or of the varieties that are made. These inks have to be made of every conceivable shade to suit the fastidious public, and have to be made at all prices to suit the purses of the printers themselves. A man desiring a job done, and wishing a cheap one, will naturally get it done with cheap and poor ink, for, all told, this material requires an inconsiderable expenditure in a year in a printing office. For a good job, good ink must be used, for even the best printer can do nothing without it.

Printing ink is a preparation very different from any of the inks used for other purposes, and its manufacture demands no little skill and experience. It should be of a soft, adhesive character, readily attaching itself to the surface of the types, and as easily transferred to the paper pressed upon them, conveying in a clear tint the exact stamp. Thus spread on a thin film and pressed into the paper it should quickly dry, and at the same time be so incorporated with the paper as not to be removable by mechanical means, while its composition ensures for it durability and a power to resist the actions of chemical agents as well as atmospheric influences. While disposed to dry readily on being applied to paper, it should retain its softness in the mass, and while excluded from the air in this condition undergo no change. Its ingredients must not be of a corrosive nature, to injure the rollers employed in spreading it.

The appearance of good ink is glossy and somewhat oily; its texture without grains; and its tenacity such as to cause it to adhere to the finger pressed against it, and yet leave but a short thread suspended from a portion taken out.

The usual materials employed in the manufacture are linseed oil, resin and coloring matters. Resin oil is largely used in the manufacture of the cheaper inks. For the best inks the linseed oil is selected of the purest quality and clarified. Lampblack is almost universally employed as the coloring matter, and much care is given in the manufacture of this article to obtain it of the very best quality. Other carbonaceous blacks reduced to impalpable powder are sometimes employed. For colored inks various pigments are introduced instead.

A great variety of qualities of inks as well as of colors are made; and as before stated as much depends on the ink as on the presswork in a first-class job.

One would hardly suppose before looking over the catalogue of such a manufacturing house as that of C. E. Johnson & Co., New York and Philadelphia, to what an extent and variety the business of manufacturing printing inks is carried on. The inks made by this house are now in almost universal use, being uniform in quality and meeting the requirements of the trade. The firm at present is Chas. E. Johnson & Co., and the principal is the third generation of those who have conducted the concern. His grandfather, Charles Johnson, who established the business started it in January, 1804; he was succeeded by his son, Charles Johnson. He in turn has been succeeded by his son, who now manages the business with such success that he has found the demand for his inks from New York and the Eastern States so great as to render it necessary to open a branch establishment in the city of New York. This old established house has kept pace with the march of improvement in the manufacture of printing inks—in fact has led it—until now their products can not be surpassed in this country or Europe. They manufacture every kind and style of printing ink known, making a specialty, however, of inks of the first quality. It is seldom in this comparatively new country that one sees an instance of a manufacturing industry continued for so long a time under the management of one family; and it argues that they understand their business thoroughly and satisfy their customers, or it would have passed into other hands before this.

Their inks are not unknown on this coast. For several years we received them through H. S. Crocker & Co., of San Francisco. They invariably gave us satisfaction. Lately we have used a higher grade of ink of Johnson's, and we say emphatically it is the best and most satisfactory in quality and prices of any. Our present issue illustrates well its character, and for the satisfaction of our readers we will say we expect to use none other for a long time.

#### The Union Iron Works.

The Union Iron Works, Prescott, Scott & Co., make the most extended exhibit of castings and machinery of any of the foundries. Among the articles shown are an air compressor, large horizontal engine, several vertical engines of different sizes, a little five-stamp mill, a hoiler feed pump, baby hoist, pans and settlers, several large sized valves, etc. The Union Works are now fitted up with machinery, tools, etc., of sufficient size and capacity to turn out any class of work. They make a specialty of mining machinery, and have made some of the largest mill, pumping and hoisting machinery in the world. Within the past two or three years there has been made at these works some magnificent specimens of mechanical skill in this line, most of which is now in operation at the mines on the Comstock lode.

This institution is the oldest of the foundry and machine shops on the coast, having been originally founded in 1849 by James and Peter Donahue. The first casting made in the State was made at these works, and is exhibited at the fair. It was cast for the propeller McKim, and cost fifty cents per pound. These works have been conducted by several firms, the present one being styled Prescott, Scott & Co., and composed of G. W. Prescott, Irving M. Scott, and H. T. Scott. Irving M. Scott superintends the mechanical branch of the business, which is a sufficient guarantee in itself that the work turned out will be first-class in every respect.

The machine, hoiler, blacksmith shops and foundry are fitted up with the best modern machinery, and all the appliances are the best that can be obtained. A specialty is made of heavy work of all kinds. The institution employs about 500 men, and pays out \$250,000 a year for labor alone. These works first introduced puppet valves on this coast and also the system of direct acting pumping and hoisting engines for mines, and, in fact, have inaugurated many other important improvements. From the nature of the products comparatively small exhibits only could be made in the fair, but the various engines, etc., shown, will stand close criticism for skill in workmanship.

#### Salamander Felting.

Seward Cole, of the Salamander Felting Co., makes a very interesting exhibit of different qualities of asbestos at the fair. There are specimens from Amador, Butte, Santa Barbara, San Diego, Calaveras, Placer, El Dorado, Los Angeles, and Merced counties. There are also some from New York, Tennessee, Maryland, and some Italian. The asbestos from Los Angeles and Butte counties is very fine and soft, and that from Colfax, Placer Co., also. It is very white and is long fibre. Some of that exhibited is of a brownish tint. Mr. Cole also exhibits asbestos cement, asbestos hoard and salamander felting. The display of this peculiar California product is the best ever made here.

This latter substance is intended for covering boilers, steam pipes, etc., for preventing loss of temperature and condensation of steam. It is exhibited in practical use on various pipes, etc., about the building. It is composed of asbestos and other fire-proof and non-conducting material, and is the best substance for coating steam boilers yet discovered. It can be applied while the boiler is hot, so it does not interfere with use. It is susceptible of a smooth and beautiful finish and may be painted or ornamented in any tasteful manner.

This felting has much to do with preventing loss of power. It has been applied with satisfaction to hundreds of steam boilers and steam machinery of every description; to hot water pipes in hotels and private houses; to hot air and blast pipes, locomotives and steam threshers, also to various other purposes, as roofs, fire-proof window shutters, ranges, stoves, ceilings, safes, and, in fact, all places where it has been desirable to prevent the radiation of heat. In addition to these advantages it is very light, does not crack or crumble off, and preserves iron from rust and corrosion. It is entirely indestructible by fire.

**THE HOPE IRON WORKS** exhibit in the machinery department two propellers, which are entered for competition. Mr. Wallace Hanscom, the proprietor of the works, has made a specialty of this class of castings, and has had a great deal of experience with them. Those exhibited are of small size, but excellently made. Wm. Hanscom drafts and designs these propellers himself, and superintends their manufacture, and as he is thoroughly posted in the requirements for various styles of vessels, he has a great deal of such work to do. There is also exhibited a steam pump by Geo. E. Cavis, from the Hope Iron Works, which can be examined by those interested in such machinery.

**THE EUREKA SENTINEL** says that the Western Union telegraph company has resolved to place the new and thriving town of Tuscaraora in telegraphic communication with the rest of the world, and that the work will be commenced at once.

**THE CHINESE** quarter at Grass Valley was burned out on Monday night, with a loss of over \$20,000 and no insurance.

## General News Items.

The weather of the past week has been the hottest of the year. The highest range of the thermometer was 93°.

The Americans won the international rifle match at Creedmoor. Grand total—3,334 for Americans, and 3,242 for British. Americans won by 92 points.

The demand of the miners who struck for a restoration of the wages paid last May at Hazleton, Penn., and a percentage on any advance of coal above \$3.25 at tide, has been allowed and the strike ended.

A special from Frankfurt states that one of the oldest Frankfurt banking firms, Drennau, Mertens & Co., have failed. Liabilities amount to 5,000,000 marks.

The State tax levy for the fiscal year 1877-78 has been fixed at 63 cents on the \$100, against 73½ cents last year. This, with the city and county tax, makes a total tax for San Francisco, this year, of \$1.83 on the \$100.

The Telegraph publishes a dispatch from Stanley, the African explorer, dated Embombo, in Congo, West Coast of Africa, August 10th. He states that he completely navigated the Luabala, and has succeeded in proving it to be identical with the Congo.

There are now only 17 cargoes of California wheat and flour en route to Europe, of which seven belongs to the crop of 1876. From this time on the departures hence will exceed the arrivals out, and the fleet afloat will therefore steadily increase for the next six months.

ARRANGEMENTS are being made for an exhibition of dogs, to take place in this city some time next month, and to be conducted in much the same way as those that have been attended with so much success in New York, Boston and London. The pavilion has been engaged for the purpose.

The United States Supreme Court opens the October session on the 8th, proximo. Its docket is nearly three years behind, and the accumulation of business is constantly increasing. Prominent members of the Bar contemplate urging Congress to provide a Commission of Appeals to assist in cleaning the docket and relieving the Court of its pending burden of business.

DR. JOHN W. FOYE, resident physician at the small-pox hospital, on 26th street, reports to the Supervisors on the working of that institution during the past year: Whole number of patients treated, 875; number of deaths, 245. Of the 875 cases, 403 were natives of the United States, including 153 of California, and 472 were of foreign birth. Of 245 deaths, 119 were natives of the United States, including 47 born in California, and 120 were foreign born.

The Pacific United Workmen's Furniture Manufacturing Company, Brannan street, has closed after five years' running, the concern not proving profitable. All the workmen engaged in the enterprise had an equal interest in the management of the business, and consequently there was no responsibility. No workman could be discharged, and the rate of wages, which was always high, was fixed by a Board of Directors. The stockholders lost about 25% of their investment.

CRAZY HORSE, who was recently killed at Camp Robinson, had, although a young man of but 26 years of age, distinguished himself as "The Fighting Chief" of Sitting Bull's band, and in that capacity served at the Custer massacre. A few months later, he came into the Agency with a portion of the hostile band. They were all disarmed and dispossessed of their ponies, and since that time Crazy Horse has been chafing under his helpless condition, and lately made a break for liberty, which ended in his death.

ON the 18th instant, the East-bound passenger train which passed Cheyenne at 3 P. M., was stopped and robbed by 13 masked men at Big Springs, Nebraska, 160 miles east of Cheyenne. The robbers first took possession of the station at Big Springs, destroying the telegraph instruments and compelling the agent to hang out a red light. When the train stopped, the robbers took possession, putting the train men and passengers under guard. The express car was broken into, and the safe robbed of about \$75,000. The passengers were also robbed. A freight train overtaking the express, its engine was sent to Ogallala, from whence a report of the robbery was made. The robbers are believed to have gone north. The Railroad Company offer a reward of \$5,000 for the arrest of the thieves.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: California, Sept. 12th, \$176,254; Tybo Con., 11th, \$8,524.70; Northern Belle, 13th, \$6,603.97; California, 15th, \$107,041.73; Con. Virginia, 15th, \$151,255.24; Martin White, 10th, \$8,027.01; Arizona, 16th, \$1,647.01; Standard 16th, \$38,339.76; Arizona, 17th, \$914.12; Endowment, 17th, \$1,884.98; California, 18th, \$182,483.33—total to date, \$465,879.90; Con. Virginia, 18th, \$147,895.16—total to date, \$299,180.40; Endowment, 20th, \$2,273.75.

LEAD has further fallen in Liverpool to \$19 17s. 6d. to \$20 5s. per ton for good ordinary brands.

## Agriculture at the Paris Exposition.

We have heard talk of the representation of some of our best California products and manufactures at the Centennial Exposition of 1878. It would be a point which men in some of our branches of production and manufacture could ill afford to lose. In wines, in dried fruits and in other specialties we are in competition with France. A world of customers for such articles will come to Paris, and if we can turn out anything which will do to compare with the French, this is the opportunity to catch the eyes of buyers and to advertise our products where it will do most good. We trust that something will be done in the way of having California well represented at Paris next summer.

We learn from our foreign exchanges that the rulers of the affairs propose to be liberal in their awards for excellence in agricultural productions. A decree has been issued by the French Minister of Agriculture and Commerce, from which it appears that a sum of 1,500,000 francs is to be set aside for providing prizes and medals to be distributed at the forthcoming Paris International Exhibition. The prizes will be awarded by an international jury of 650 members, of whom 300 will be French, and 350 foreigners, the latter to be nominated to the office of jurymen by their respective governments. Their labors will extend from the beginning of June to the end of August, and the prizes will be distributed among the successful competitors on September 10th, 1878. Among the awards placed at the disposal of the jury for excellence in agricultural and industrial products are 100 large pieces of plate, 1,000 gold medals, 4,000 silver medals, 8,000 bronze medals, and the same number of "honorable mentions."

**ORDERED TO LEAVE.**—The meeting at Roseville on Monday night resulted in the Chinamen being ordered to leave. A number of armed men went to the different Chinese mining camps on the Auburn road, at which were some 60 men, who were ordered to leave. These proceedings were brought about by the murders committed at Rocklin by Chinamen. Every house in Chinatown was destroyed, and the occupants driven out of Rocklin.

**STILL AT THE FRONT.**—The meeting at Roseville on Monday night resulted in the Chinamen being ordered to leave. A number of armed men went to the different Chinese mining camps on the Auburn road, at which were some 60 men, who were ordered to leave. These proceedings were brought about by the murders committed at Rocklin by Chinamen. Every house in Chinatown was destroyed, and the occupants driven out of Rocklin.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

## BY GUIDO KUSTEL, MINING ENGINEER AND METALLURGIST.

**Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver.** 1870.  
This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.  
It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.  
Price, \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenides, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.  
This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in any other book. It is also throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy, and containing 672 Pages and 83 Engravings.

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE bound in cloth, \$10.50; in leather, \$12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by DEWEY & CO.

SAMPLE COPIES.—Occasionally we send extra copies of this paper to those we believe would be benefited by subscribing for it themselves, or who are willing to hand the paper and speak of its merits to others. We call the attention of such to our prospectus and terms of subscription.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

## California Fruit Growing Association.

Location of principal place of business, San Francisco, Cal. Location of property, El Dorado Co. Notice is hereby given that at a meeting of the Board of Directors, held on the fourth day of August, 1877, an assessment (No. 6) of \$3 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the company, 331 Sansome Street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the fourth day of September, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the first day of October, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, HORACE JONES, Secy.

Office, 3

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,

—ALSO—  
Hammered Iron of Every Description and Size  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

## ÆTNA IRON WORKS,

MANUFACTURERS OF

## IRON CASTINGS

and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

## SHEET IRON PIPE.

## Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.  
Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

—All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

## PHELPS MANUFACTURING COMPANY.

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

BET. MISSION & HOWARD, SAN FRANCISCO

## STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

McAFEE, SPIERS & CO.,  
BOILER MAKERS AND  
GENERAL MACHINISTS,  
Howard between Fremont and Beale Sts., San Francisco.

## Machinery.

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 55 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—24 Cords at \$3 per cord.....	5 25
Salt—1,000 lbs at 2¢ cents.....	40 00

Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61½

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Eschequer mill, Alpine Co., Cal. For further in-  
formation, apply to

D. J. O'HARRA,  
Reno, Nevada.

## THE LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

## BRUCKNER'S PATENT REVOLVING FURNACE,

For Chloridizing, Desulphurizing and  
Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEAR-  
ING AND MINING MACHINERY.

Send for our Illustrated catalogue.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER.  
J. C. Sanderling, Sole Ag't Pacific Coast,  
51 Fremont Street S. F.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

## TAKES THE PLACE OF ALL OTHERS.

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other Drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,  
320 Sansome Street,  
(Room 10.)

## Buy the Best.

Before purchasing an American  
Watch, examine the different styles  
manufactured by the HAMPDEN  
WATCH COMPANY, at Springfield,  
Mass. They are the latest and  
best improved manufacture. You  
can depend upon them for fine finish,  
durability and perfect time. They  
are sold at favorable prices—in  
fact, no higher than many of the  
inferior styles. Examine into the  
merits of this Watch before you  
buy any other. Our word for it,  
you will not regret it.

DEWEY & JORDAN, Agents,  
433 Montgomery St., S. F.

## ARTIFICIAL LIMBS.

MENZO SPRING,

MANUFACTURER OF

ARTIFICIAL LIMBS.

OFFICE AND ADDRESS,

9 Geary St., San Francisco.

Descriptive circulars, blanks for  
measurements, with instructions and  
price list free on application.

## MINING INTEREST FOR SALE.

For a small amount, in several claims on one of the

RICHEST LEDGES IN ARIZONA.

Money needed for development. The ore will pay a hand-  
some margin to ship to the city. Apply at this office.

## Metallurgy and Ores.

JOHN TAYLOR & CO.,

Importers of and Dealers in

ASSAYERS' MATERIALS,  
CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
etc., manufactured by the Patent Plumbago Crucible  
Co., of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.  
Also, to our large and well adapted stock of

Assayers' Materials and Chemical Apparatus,

Having engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.  
—Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

# REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

## GREAT ENTERPRISE.

THE

## Sierra Flume & Lumber Co.

HAVE OVER

100,000 ACRES OF SUGAR PINE,

Yellow Pine, Spruce, Fir and

Cedar Lands.

10 Saw Mills, 3 Planing Mills, 1 Sash  
and Door Factory,

149 Miles V Flumes, 10 Miles of Tramways

157 Miles of Telegraph Line, 13 Telegraph

Stations, and Employ 475 Men

and 550 Oxen and Horses.

The Sugar Pine is unsurpassed in quality, and the

whole Coast can be supplied.

The Yellow Pine is firm, fine grained and superior to

any other hard pine for Flooring, Stepping, etc.

The Spruce has great strength, durable when exposed,

and especially adapted to Bridge and Ship Building, while

the Fir and Cedar are as valuable for a great variety of

purposes.

Last year thirty millions of feet were cut and the estimate

for 1877 is fifty millions; fifteen millions are now on

hand, thoroughly seasoned by the hot climate of Red

Bluff and Chico.

Large orders can be filled on a day's notice for

kinds of

### BUILDING MATERIALS,

Rough or dressed dry, by which elegant and substantial

work may be accomplished without delay at the usual

cost for green lumber.

Orders for the interior filled at less than San Francisco

prices and freight.

Doors, Sash and Blinds always on hand in large

quantities. Address

SIERRA FLUME AND LUMBER CO.,

PRINCIPAL OFFICES:

Red Bluff; Chico, San Francisco—Corner

Fourth and Channel Sts.

### OUR AGENTS.

Our FRIENDS can do much in aid of our paper and the

cause of practical knowledge and science, by assisting

Agents in their labors of canvassing, by lending their

influence and encouraging favors. We intend to send

none but worthy men.

J. L. THARP—San Francisco.

B. W. CROWELL—California.

A. C. KNOX—Pacific Coast.

C. N. WEST—Santa Cruz, Monterey and San Benito

counties.

A. C. CHAMPION—Tulare, Fresno and Inyo counties.

JOSEPH DIMMICK—Alameda and Contra Costa counties.

W. D. WHITE—San Bernardino and Los Angeles counties.

counties.

B. E. LLOYD—Alameda and Contra Costa counties.

E. M. DENNY, Oregon.

F. B. ALDERSON, Nevada.

We have the best Imitation Gold Watch in the Market for Trading  
Purposes. The metal is a composition of other metals, so closely resembling  
gold that the best judges find it difficult to detect the difference, except by a  
chemical test, and it has the virtues requisite to make it the best substitute  
for gold known. GENUINE AMERICAN MOVEMENT. EXPANSION BAL-  
ANCE. BEAUTIFULLY ENGRAVED OR  
ENGINE TURNED HUNTING CASES,  
and equal in appearance to a GOLD  
WATCH THAT COSTS FROM  
\$180 TO \$200. It sells and trades  
readily, for from \$60 to \$100, and if you  
wish a watch for your own use or to make  
money on, try this. Owing to our large  
sales, we are enabled to reduce the price  
of them to \$12 each with an elegant  
Chain attached. They are used on  
Railroads, Steamers, and in Manufactories,  
and other places where accurate time is required,  
and gives general satisfaction. We send them  
by Mail or Express, on receipt of \$12, to any  
part of the Country, or it will be sent C.O.D.  
when the customer desires and remits \$3 on ac-  
count. These Elegant CHAINS weigh about  
Fifty Pennyweights, and the same pattern in  
pure gold would cost \$200. We sell these Chains  
at \$3 each. But we sell the Watch and Chain for  
\$12, sent by Mail in a Registered Package, post-  
paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.  
J. BRIDE & CO., Clinton Place & No. 11 Eighth Street, N. Y.

## Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC  
PRESS PATENT AGENCY was estab-  
lished in 1860—the first west of  
the Rocky Mountains. It has  
kept step with the rapid march  
of mechanical improvements.  
The records in its archives, its  
constantly increasing library, the  
accumulation of information of  
special importance to our home  
inventors, and the experience of  
its proprietors in an extensive and  
long continued personal practice  
in patent business, affords them  
combined advantages greater  
than any other agents can possi-  
bly offer to Pacific Coast inven-  
tors. Circulars of advice, free.  
Address

DEWEY & CO.,

202 Sansome St., N. E. Cor. Pine,

San Francisco.

Thanks for Prompt Attention

Stockton, June 26th, 1875.

Messrs Dewey & Co., S. F.—

I have received the patent for my invention in wagon

brakes, which you prosecuted for me; patented May 11th,

1875—No. 163,046. Thanks to you for your prompt atten-

tion to the case; you will hereafter be my attorneys in

such cases. I recommend all inventors on the Pacific

coast to give you a call, which I think they will never

have any cause to regret. Very truly yours,

GEO. G. BUCKLAND

## An Improved Cube Sugar Machine.

The old-fashioned method of making sugar in loaves and crushing it, is now almost entirely out of date and the manufacturers make it in small three-quarter-inch cubes ready for the market. A great deal of ingenuity has been shown by inventors in perfecting a machine to form the cubes expeditiously and in a satisfactorily exact manner, and large amounts of money have been expended in experimenting. The latest experiment in this line is the machine of Jasper & Boushey, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency. We visited the Bay Sugar Refinery, in this city, one day this week, to see the new machine in operation, and have prepared an engraving showing the details of operation.

The machine occupies a space of about four feet by nine. The sugar comes down from the centrifugal machine on the upper floor through the box, A. In this box is a roller, F, with pins, running at a speed of 1,800 to 2,000 revolutions, which, by centrifugal force, throws the damp sugar down on to an iron plate. These plates, G, are drawn underneath the box, A, one at a time, by means of the endless chain, d, which is operated by the eccentric cam, L, connecting rod, e, and the ratchet gear, b, c. As the plate, G, is drawn under the box, A, the sugar is pressed down by the centrifugal action of the roller, F. The plate, after being covered with sugar in this manner, is drawn along by the endless chain until it comes under the knife.

The cutting apparatus is a series of blades, O, forming squares, and is shown in detail in Fig. 2. These blades are operated by the bar, T, and the levers inside the frame, not shown in the engraving. Inside of each one of these squares is a presser or plunger, P, which fits closely to the sides of the square. As the knife or series of squares goes down these pressers, P, remain stationary until the knife, O, has performed its duties of cutting the soft sugar into cubes. Then the presser, P, comes down one-quarter of an inch with a pressure of 6,000 pounds, pressing the cubes out by the knife, O, to the perfect size of three-quarters of an inch. The action of the knife, O, is to cut the sugar into cube shape, and that of the presser, P, to force the cubes into uniform size, and also make them compact so they will not crumble. After the sugar is cut and pressed and the knife, O, draws back three-quarters of an inch, the presser, P, begins also to draw back, both knife and presser moving upward for a quarter of an inch. By this means the pressers not only impress the sugar into solid cubes after they are cut by the knife, but also act as plungers to keep the cubes on the plate as the knives are withdrawn.

The cutting knives, O, are operated by the levers (not shown in the engraving), which draw down the bar, T, to which the knives are connected by rods, x, z. The pressers, P, are operated by the lever, H, connected with the bar, S, and rods, r, r. The bed plate, M, is a heavy piece of iron which takes the pressure necessary in forming the cubes.

The iron plates, G, are piled up in front of the feed box, A, and are drawn under by the endless chain, as described, one at a time. As the plates pass under the knives and pressers four cuts are made on each plate, there being about 10 pounds of sugar on each plate. The plates then pass on to the endless belt, K, which is operated by the roller, J, by which they are carried to the drying room. As the plates pass

under the feed box, A, and receive the sugar, which is forced on them by the centrifugal motion of the revolving shaft and pins, F, the scraper, U, takes off the superfluous sugar. The details of this are shown in Fig. 3.

This scraper can be adjusted by set screws so as to get a certain amount of sugar on the plate according to the quality of sugar. Two small plows are fastened on the iron frame near the cutting knives, for scraping off the small, superfluous quantity of sugar left on the plates after the cubes are made. This waste is very small, amounting to no appreciable quantity.

address is P. O. box 1,350) have also devised a plan for a drying room, by means of which, in connection with this machine, cube sugar may be prepared for the market in three hours' time. This machine marks an important era in the manufacture of sugar.

The *Black Hills Pioneer* gives a list of 20 mills, carrying 195 stamps, now running in the Black hills, and names seven mills which will contain 125 stamps now in process of erection. These 320 stamps ought to reduce a good deal of rock if kept steadily running, though recent

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**CONCENTRATOR.**—Joseph S. Duncan, S. F. This is an improvement in concentrators, such as are employed to separate the valuable metalliferous particles and sulphurets from the refuse portions of ores. It consists of one or more vessels or chambers, of a peculiar shape, into which the pulp is introduced, and, as the heavier particles fall towards the bottom, they are met by a body of water which is given a rotating motion as it flows onward; and by its effect it causes the different grades in weight to settle into a series of receptacles extending down the sides of the vessel or vessels.

**STONE LATHE.**—Frank Keseler, S. F. Marble manufacturers employ what is known as a rubbing or polishing wheel or bed, for grinding and giving a uniform surface to such pieces of plain surfaced stone as can be held down upon it. This wheel or bed consists of a circular plate of cast-iron mounted horizontally upon a vertical shaft, and driven at a proper rate of speed, so that by pressing down upon the moving cast-iron surface of the bed or wheel, the surfaces of the stone will be ground evenly and uniformly. This invention consists in attaching to the frame of such rotary bed or wheel a lathe, by means of which the cast-iron grinding surface can be utilized for turning cylindrical forms, either true or conical.

**SOLDERING IRON.**—Thos. J. Walsh, S. F. This invention is an improvement on irons such as are used for soldering can tops, in which a circular ring of copper is employed to fit the rim to be soldered.

The difficulty in heating these irons without burning and spoiling the copper ring is very great, and is a serious annoyance. Mr. Walsh's invention consists in the employment of an interior solid cylinder of iron, which is connected with a rod and handle, so as to be movable longitudinally, and this cylinder is thrust forward so as to be heated by the fire without exposing the copper ring, and is withdrawn into the ring, to which it communicates its heat for use.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: California, Sept. 22d, \$201,342.38—total to date, \$667,122.28; Con. Virginia, Sept. 22d, \$141,477.38—total to date, \$440,657.78; Northern Belle, Sept. 20th, \$9,571.31; Northern Belle, Sept. 23d, \$10,575.13; Leopard, Sept. 25th, \$5,000. Following is an official statement of the bullion product for the last fiscal month of leading Comstock mines: Belcher, \$25,200; California, \$1,403,300; Chollar-Potosi, \$25,100; Con. Virginia, \$1,445,800; Justice, \$202,300; Ophir, \$7,900—total, \$3,109,600.

The tug *Wizard*, now lying at Pacific street wharf, has been almost completely rebuilt, at an expense of about \$20,000. She has been renewed from below the water line, with new decks and new timbers, and her engines, which have been built by the Risdon Iron Works, are of the compound pattern, one cylinder 26 inches in diameter and the other 44.

FIG. 1, JASPER & BOUSHEY'S IMPROVED MACHINE FOR MANUFACTURING CUBE SUGAR.

Fig. 2, Knife and Presser of Sugar Machine.

Fig. 3, Feeder and Scraper of Sugar Machine.

capacity of 60 pounds per minute. It requires one man to feed the sugar, one man to operate the machine and put the plates in position ready for passing through, and one man to take the plates, filled with sugar, from the belt and put them up in the drying room. The cubes are perfect in shape and the crystalline structure of the surface is plainly seen, which is not the case when the surface is sawed into cubes, as by some processes. The patentees (whose

arrivals from the Black hills state that some of the mills have not rock enough to keep them running more than half of the time. Black hills quartz mills are gold mills, simply provided with stamps, copper plates and blankets. Of course they are inexpensive affairs when compared with silver mills, with their appliances for working rebellious ores.

In consequence of a strike on the Great Southern and Western railroad in Ireland, the Postmaster General orders steamers from America to land only the Irish mails at Queenstown and take the others to Liverpool.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Notes from Colorado.—No. 2.

[By our Traveling Correspondent.]

EDITORS PRESS:—The Cornish tunnel, mining and reduction company is an organization of Boulder county, Colorado. The location of this tunnel is through Gold hill, about 10 miles west of the city of Boulder, entering the mountain a little above Left Hand creek, through the mountain 3,000 feet in length, to the southern slope of the same mountain; the line of the tunnel being about one mile east of Gold Hill village. Gold hill rises very precipitously from Left Hand creek, so that the first 2,000 feet of the tunnel would obtain a depth of nearly 1,000 feet.

This hill is also known to be a great network of veins, some of them very large and rich in gold and silver; some samples from some of them assaying over \$100,000 to the ton.

This mountain is located not far from the center of the wonderful telluride mineral belt of Boulder county, extending, so far as is known at present, from Magnolia mining camp on the south, to Ballarat mining camp on the north, a distance of 12 or 13 miles.

The tunnel of the Cornish tunnel company was started in 1872. It enters the mountain several hundred feet above Left Hand creek, at its base, but a depth of about 900 feet will be attained below the summit by continuing the tunnel through the hill. The size of the tunnel is five feet in width by seven feet in height. This tunnel has been run into the mountain between 950 and 1,000 feet, and, in respect to the character of the work done, will compare favorably with any other tunnel ever constructed. At the entrance of the tunnel a suitable building has been put up, in which is a blacksmith shop, engine room, lodging places for miners, etc. For ventilation, an engine with suitable pipes has been located, extending through the works. A substantial car track has been laid through the tunnel and into the drift of the Bonanza mine, and cars are running daily, taking out rock and ore. Six mining veins have already been cut by the tunnel, four of them being of large size and already developed somewhat by drifting upon them. All these mines belong to the tunnel company. The Relief mine was cut by the tunnel at about 212 feet from its mouth. The vein of this mine is about two feet in width, and a drift has been run upon it about 50 feet in length. A large body of ore has been found in this mine, principally iron pyrites, carrying gold, but not of high grade.

#### The Reliance Mine

Is cut by the tunnel about 400 feet from its entrance. The vein of the mine is about five feet in width, and a drift has been run upon it about 120 feet in length. The ore is also of low grade, being large part iron pyrites, carrying gold. Assays of the ore from the Relief and Reliance mines have shown gold and silver in the ore, from a few dollars to \$140 per ton.

#### The Bonanza Mine

Was cut by the tunnel at a distance of about 600 feet from its entrance, and has been drifted on about 300 feet. The vein of this mine is one of the largest, most even and compact veins to be found. Its average width is four feet, and it is well filled with ore assaying from a few dollars to \$250 per ton. The company owns 1,500 feet of each of the veins cut by the tunnel, etc.

At a distance of about 960 feet from the entrance of the tunnel, the "475" mine is crossed. At this point, where the tunnel crosses the mine, the vein is 16 feet wide. In this immense mass of gangue there are four or five streaks of rich telluride ore, varying in width from one to five inches.

In cutting the tunnel through this vein some very handsome specimens of tellurium and free gold were taken out, assaying from \$563 to \$10,000 per ton. In connection with this property the company have

#### Two Mill Sites,

For which Government patents have been obtained. On one of these sites, and immediately on the bank of Left Hand creek, stands the 20-stamp mill of the company. The power is furnished by a splendid 60-horse power steam engine. Water power from the creek can be had to drive the mill for at least eight months in the year.

The capital stock of the company is \$200,000—2,000 shares of \$100 each; 1,300 of these shares have been sold, and 700 are still reserved as a working capital. More than \$100,000 have been expended upon this property.

#### The "John Jay" Mine,

Belonging to Mr. A. I. Van Deren, is situated in Central mining district, Boulder county, Col., about three miles from Jamestown, four miles from Gold Hill, and 14 from Boulder City, where connections are made with all Eastern and Western railroads. The altitude of the

mine is 8,500 feet above the level of the sea. The height, however, does not impede the development of it, being situated on the southern mountain slope, exposed to the genial rays of the whole day. The climate is very mild, indeed, snow rarely staying on the ground more than a few days at a time.

Every facility that could be possibly offered for mining is here given in timber and water. The mountain pines and spruces are magnificent beyond description. For miles around the giant pines tower heavenward undisturbed by the axeman, until recently a saw mill has been erected in Providence camp, and about 200 yards east of the main shaft, on Jim creek. The water is abundant for all and every mining purpose. A large stream dashes along wildly at the mountain's base as pure as the sunlight and clear as crystal, affording a never-ending supply for all mining purposes. The scenery is wild and picturesque, romantic and sublime. Geologically the country rock is gneiss granite, in places taking the true form of granite; still at other points it is syenite. The strike of the vein is N. 30° E. with a dip to the N. W. at an angle of 80°. The lode is a strong, well-defined and true fissure, as is proven beyond the possibility of a doubt by the numerous shafts, prospect lodes and the depth of the main shaft (about 200 feet from surface). The ore of this mine is known as telluride ore, very rare and exceedingly rich in gold and silver. The discovery of this precious mineral in Boulder county has created an intense interest throughout the mining and scientific world, and to-day the mines of Boulder county stand very high in the estimation of all intelligent miners. Pieces of ore many pounds in weight are found in these mines that will assay \$150,000 per ton.

The development of the John Jay consists of one main shaft about 200 feet deep, one level 116 feet long; three other minor levels, 60, 45 and 33 feet long. From these excavations Mr. Van Deren has taken a large amount of valuable ore—enough to net him over \$50,000, besides defraying all the expenses of developing the mine, building a road to Gold Hill and one to Jimtown, the latter at a heavy expense. And it is estimated that there is ore in sight to the value of \$150,000.

The notes from which these statements in regard to the John Jay mine are given, were furnished to me by Mr. W. M. Rule, Mr. Van Deren's foreman, at his request.

To Col. John A. Ellet, of Boulder City, Superintendent of the Cornish tunnel, I am indebted for the information embraced in my notes regarding the progress of their tunnel mine at Gold Hill. G. W. M.

### Matamoras Company.

The Matamoras company have reason to be well satisfied with their season's work. Besides developing as fine a body of ore as was ever found in Prospect mountain, they have in their short run at the furnace produced over 130 tons of bullion, valued at \$50,000. This, from the small furnace used by the company, is a remarkable result, and Messrs. Sturgis & Steel are to be congratulated on their success. The company have under way and will commence shortly many important improvements. The little Butteport smelter is about to be replaced by a large furnace, capable of reducing 50 tons of ore per day. The site has already been graded, and Foreman Atkinson informs us that it will be completed by the 10th of October. Mr. Steel has gone East, and during his absence will purchase hoisting works, materials for a tramway, and other articles necessary. Timbers for the main shaft are being sent to the mine daily, and this will be at once pushed forward. It will contain two compartments, and will be furnished with a safety cage and other improvements of the latest and best invention. The body of ore recently encountered in the mine is proving to be a splendid deposit, of as yet unknown extent. Its proportions are, however, sufficient to justify the necessary outlay incurred by the company in putting everything in first-class shape, and adds one more to the list of good mines in the district. *Eureka Sentinel.*

#### NEW SPOUT FOR THE CALIFORNIA MILL.—

To-day a new spout will be put in for conveying the pulp from the California battery to the pan mill. This has to be done about once a year. The grit is so sharp that it cuts away the fibers of the wood at the rate of two inches yearly. The last spout put in had a three-inch bottom. This has been worn away by the pulp till the nails which held it together are entirely cut off and gone. It has been found, of late, necessary to wedge it up from the outside to hold it together. Everything is worn away as by the grit of a grindstone. The wear of the pulp is curiously manifested where knots occur in the planks composing the spout. These knots wear slower, of course, than the other portions of the timber, being harder. After the flow begins to rise over these knots the plank on each side is rapidly cut out, so that the first thing known, unless carefully watched, there is a hole. The plan now adopted is to build a double flume, one within the other, and when the inner one is worn out to yank it out and put a new one in its place. Everything is now ready for this kind of a change, which will be made to-day. The delay in operations at the mill will be from three to four hours only. This stop will be seized upon to put in a new piston at the pan mill. *Enterprise.*

### Copper in Arizona.

The Arizona Citizen says: Arizona, without doubt, has the largest and richest deposits of copper in the United States. There is much copper near the Colorado river, on Bill Williams' fork; some 40 miles west of Tucson there is a mountain or more of it; it is abundant in Globe district; but, perhaps, the largest and richest deposit in America is at Clifton. With rail transportation as near as San Simon valley, 100,000 pounds of pig copper daily are promised by two companies alone, and enough smelting has been done to warrant that the promise will be fulfilled. Railway men are asked to note this one item from but one of many localities in Arizona. In this connection we copy the following from the Grant county Herald, of August 25th:

I. N. Cohen & Co. shipped to-day, by Maxwell's train, 55,000 pounds pig copper, via El Moro to Baltimore, and have still in store 47,240 pounds. This proof is as strong as holy writ that Lesinsky's Longfellow mine is panning out.

Sweeney & Gleason's furnace, also at Clifton, has lately been fired, and there is no reason why it should not duplicate the daily yield of the Lesinsky furnace. The ores of both companies are smelted in the Bennett furnaces. None other have been found to stand the test.

At Clifton there are 80 recorded mines, all of which are regarded as exceedingly valuable, and the lack of fuel is all that prevents the ores from being worked. The completion of the Texas Pacific or the California Southern Pacific to a point convenient for the shipment of ores or transmission of fuel to the furnaces, will work such a change in favor of the production of copper as to heggar the belief of the most sanguine. The Longfellow and Thompson are the only mines worked at present, and the companies working them only run one 30-inch furnace each; and, notwithstanding the limited capacity, they will turn out 3,000,000 pounds pig copper annually.

When rail transportation can be had to a point as near the mines as the San Simon, Mr. H. Lesinsky assures us that the yield will be not less than 100,000 pounds pig copper daily from the works of these two companies, which is not a tithe of what will be produced by other companies which will then enter into the business of producing copper ingots.

The Clifton ores are infinitely richer than those of Lake Superior, which will not be denied when their relative values are known. The Clifton ores are entirely free from base metals; no antimony or arsenic are contained in them, and, as a consequence, the copper brings a higher price in copper markets than any other offered for sale. The Clifton ores average from 20 to 30 per cent. copper, while those of Lake Superior will not go above 10 per cent., if as high; and yet the Superior deposits are the brag mines of the country, and perhaps justly so, for the reason that other Eastern competitive mines only give from five to six per cent. But now the Superior deposits must dwarf in public estimation, both as regards quality and quantity of ore, for the reason that the value of Clifton ores are becoming better known. In our last reference to this subject, we stated that rail transportation would induce H. Lesinsky to work 1,000 men in his mines, which he can do with profit to himself and employees, if freight of fuel and copper were cheapened; and what Mr. L. can and will do, others there, owning mines, would find it to their interest to do also; and with this knowledge of the prospective industries of Clifton and other mining regions (and they are not a few), we impatiently wait the whistle of the locomotive.

Shipping north, via El Moro, ceases after the last of September, for the reason that owners of trains do not choose to risk the pinching cold that is encountered in that hyperborean region after the middle of October; and, consequently, copper accumulates at the works from that date until March, unless an outlet can be found for it by the Southern route, through Texas.

MINER PREACHERS.—Theologians and gentlemen devoted to the ministry generally find their duties of so brain-racking and arduous a nature as to totally incapacitate them from manual labor. The week days are devoted to the preparation of elaborate discourses, and the Sabbath to the delivery of the same. Ruby Hill, however, furnishes two examples of a directly opposite nature. Rev. Mr. Wm. Johns and Cox are both as good miners as ever wielded a pick in a drift, or let off a blast, and can be found taking their regular shifts, and earning their \$4 per diem, on all occasions. When Sunday rolls around they in turn fill the pulpit at Miners' Union hall, and preach the "Word" to a congregation of stalwart miners, who through the building at that time. They are both eloquent and educated men, and their pulpit oratory is above the average. They serve their Master without reward, and scatter their seed in good ground. The restraining influences exercised by them can be best appreciated by stating the fact that a more orderly or intelligent community cannot be found on the coast than the inhabitants of the little village on Ruby hill. *Eureka Sentinel.*

THE miners of Pennsylvania, Michigan and Wisconsin are said to be organizing a new secret order, called the "Iron Hearts." The oath binds the members to obey all orders at the peril of life, to defend the interests of the order, never to reveal its secrets and to succor brother members.

### Colorado Mines.

A correspondent of the Denver Tribune, writing from Rabbit-ear range, Grand county, Col., says: Nearly all the more prominent mines here are being worked by small forces of men on each. Mr. Bower is running a drift on the Wolverine lode; has now about 10 inches of good pay in sight, which is widening with depth. The character of the mineral in this drift is chloride of silver, which is nearly 50% pure silver. There is also with this through the quartz native and ruby silver found very frequently. The Wolverine will, in all probability, go into the hands of California men this fall. If so, it will be worked vigorously all winter. The Crown Point lode, the boss lead lode of the Rockies, will, perhaps, be taken in hand by the same parties.

Stokes & Johnson have about completed their work for this year on the Forst Juan. This is a recent discovery and promising lode, and shows a strong vein of almost solid mineral five feet wide. A 50-foot drift crosses this lode at a depth of 30 feet. This is intended only as a discovery "hole." The lode will be further developed with a tunnel lower down the mountain. L. J. Pollard is preparing to work his Ruby lode the coming winter. He is putting up a house near the mine, also a blacksmith shop. Len proposes to take out some very fine ore this winter, unless, driven to despair by the too-frequent visits of Mr. Bruin, he is compelled to take the field in defense of his home and fireside. In this case he will very likely take out a few grizzly bear skins instead of ruby silver.

Clauston & Porter will work their lode, the Silver Glance, this winter. They are getting out their timber supplies, etc., so as to begin business in earnest.

Isaac Burton is tunneling on the Hilberton lode, and will continue to work it all winter. This is undoubtedly one of the best mines yet discovered here, and it is only partially developed.

The Grand Lake lode and numerous others will be worked some this winter. A good many of the prospectors up in this section, owing to the hard times, have been obliged to abandon a number of their discoveries, which will all prove valuable to some one in the future. If we had mills here we would feel that we were as independent as any of our neighbor mining camps. But in this respect we are pretty badly left.

### Explosion of Gas in an Amalgamating Pan.

The Gold Hill News, speaking of an accident at the Petaluma mill, says: The manner of the accident was as follows: When the amalgamating pans are started up after they have been cleaned the action of the heat and mercury upon the pulp rapidly generates a gas, which explodes as readily as gunpowder upon coming in contact with fire. Every amalgamator is well acquainted with this fact, and they always take every precaution to prevent an explosion from this source. Mr. Brown, who was an old and experienced workman about quartz mills, knew this well enough, but this morning he seemed to have neglected or forgotten the fact. He raised the small lid in the top of the pan to examine the condition of the pulp, when the gas rushed out through the opening. It was ignited by the fire from the candle which Brown held in his hand, resulting in a tremendous explosion, the report of which sounded like the firing of a cannon. Brown was knocked senseless by the concussion, and received several body wounds, the exact extent of which could not be learned by the News reporter, who visited the mill this morning. His face was badly burned by the flaming gas. It is feared that his sight was totally destroyed. A team was obtained from Mr. Emmet, of Gold Hill foundry, and the injured man removed immediately to his room on A street, Virginia City.

Mr. Brown is a single man, and has no one dependent upon him for support. He had formerly worked in the Sacramento mill, north of Virginia, and had been employed in the Petaluma mill since the first of the month, and had proved himself a skilled and competent workman.

The accident need not have occurred if the lid had been left open a few minutes so as to allow the gas to escape. This is generally done, or else the light is kept at safe distance. The disaster can be attributed to nothing but Brown's absent-mindedness and carelessness. Fortunately none of the other workmen of the mill were near enough to the pan at the time to in any way feel the effects of the shock, or to come in the way of the flying fragments of the iron castings. The top of the pan was blown off, but there was no other damage done to the mill.

ARCHING TUNNELS.—The water company has a large force busily employed repairing and strengthening the canal in anticipation of winter. Prominent among the various improvements being made is the provision for the protection of the tunnels on the line of the ditch. The tunnel through Cape Horn ridge, as well as the one that perforates the mountain nearly opposite the Flume house, is being arched with solid masonry. The cost will be considerable, but the work will be permanent when completed, and be the cheapest in the long run. No other canal in the State is in better repair or more carefully looked after than that of the Mokelumne Hill Water Company. *Calaveras Chronicle.*

## MECHANICAL PROGRESS.

## Testing the Strength of Metals.

According to the *American Manufacturer*, we are to have something new in the way of a testing machine. We read that Mr. John L. Gill, Jr., of Pittsburgh, has been engaged for some months in the construction of a new and powerful machine for testing metals, at his car-wheel works. Having given great attention both to the chemical analyses and mechanical tests of metals for some years, he has qualifications and opportunities of knowing just what is required in practice. The capacity of the machine is 100,000 pounds. We give as follows his own reasons for building his machine, which will be appreciated by all scientific persons: "During the course of the experiments I met with an unexpected obstacle. I found the testing machine could not be made to give the correct value of the tensile strength, in consequence of its inability to pull the specimen in a direct line of its axis. In testing cast-iron, the specimens were subjected to a bending as well as tensile stress, which caused them to yield partly by tearing, thereby giving variable and unreliable results. I have therefore been compelled to consider all my past experiments on tensile strength of cast iron as worthless. On investigation, it appeared that the defect above mentioned was common, to a greater or less extent, to all testing machines in use. To remedy the defect, I found it necessary to design and build a new testing machine, involving a principle never before tried, which should insure that the line of stress should be an absolutely direct straight line, coincident with the axis of the specimen." We hope to report more particularly upon the machine at work in a few weeks.

**PERFECT IMITATION OF GRAIN OF WOOD.**—There is a paper carpet made in England by Mr. Gloyne, which is designed to imitate parquet flooring; the paper being printed in patterns to imitate different woods from photographs, so that the *reproduction* is absolutely perfect. The floor is prepared by being made perfectly level, and the crevices filled up with plaster of Paris. Over this hessian is stretched, and on this first lining paper, and then the patterned paper is pasted, the whole being finished with a coating of a peculiar varnish, wonderfully hard and wear-resisting. This carpeting, of course, can be kept perfectly clean with the greatest ease; and though the wear of paper carpet may be thought problematical, Mr. Gloyne testifies that he has had rooms carpeted with it for 16 months without showing appreciable signs of wear. There is a wide field of utility open to the use of the photographic grained paper in many ways, for it is the most remarkable imitation of ornamental woods ever produced.

**DOUBLE SCREW.**—At a recent English exhibition, a novel form of arrangement of the dual engine was shown by Mr. Somerset Mackenzie. Great increase of power is obtained in screw-propellers by using two screws rotating in opposite directions, one taking the water of the other. By the use of a hollow shaft and double engines this can very easily be accomplished, but Mr. Mackenzie has discovered how to do it with one cylinder—that is, he gets two reverse rotating motions from the action of one cylinder and piston. How this is managed it is not very easy to explain without the aid of diagrams, but we may state that while one shaft is driven by an ordinary crank the other is driven by a kind of slotted crank, with its head passing round the other shaft as it rotates. This is the arrangement in the vertical engine; that of the horizontal, which is about to be put in a boat recently constructed, is somewhat modified, but the same in principle.

**LOCKING MINERS' LAMPS.**—A very simple and at the same time effective method of locking miners' lamps has been adopted at the Atherton collieries, near Manchester, England. The ordinary locks and keys, which are so easily tampered with, are entirely discarded, and a soft metal bolt supplies their place. Before the lamps are given out from the office each top is secured down by one of these bolts, which, after being pushed through a slot, is flattened and stamped at both ends by means of a machine constructed for the purpose. Once fastened in this manner the lamp cannot be opened without destroying the bolt, which is only extracted when the lamp is again brought up from the mine, and the impressed stamp at either end effectually prevents any other than the one issued from the office being placed in its stead.

**NOTE ON PHOSPHOR BRONZE.**—We read in a report of the English Polytechnic Society's fair, that the Phosphor Bronze Company obtained a first silver medal for a large collection of exhibits illustrating the various uses to which this invaluable alloy can be and is put. Our readers are aware that phosphor bronze is a compound of tin, copper and phosphorus in certain proportions, according to the special work required. Among the exhibits were several hearings that had been in constant use for long periods without appreciable injury, and a plunger that had been in operation 572 days without giving any evidence that it had been in work at all. Few better illustrations of the wear-resisting properties of phosphor bronze could have been afforded.

## WASTE AT SAFETY VALVE AND WHISTLE.

A writer calls the attention of the *Railroad Gazette* to the amount of steam which may be wasted at the safety valve and the whistle of a locomotive. If it requires from 100 to 120 pounds pressure to the inch to enable an engine to perform its daily task, and the safety valve is set to blow off at 130 pounds, it would seem that this ought to give the engineer and fireman ample latitude to so enable them to adjust the ash-pan dampers and door of the furnace that steam would rarely escape at the safety valve. As to the whistle, a simple toot or two, in cases of emergency, to warn some one from the track, or as a signal for the brakes, would seem to be the only legitimate use of steam in the way of whistles. And yet of the 20 or more trains which daily pass my residence, I notice that nearly half of them make a regular practice of blowing their whistles some 20 rods at a time and some half-dozen times within as many miles, and their safety valves also seem to be at work much of the time. It would be interesting to know exactly what per cent. of the fuel is wasted in this way. If the coal hanks upon their tenders were so made as to let a bushel of coal drop upon the track every 10 miles of their progress, the waste would then become so manifest, no doubt, that it would be attended to at once. If one train can be run without the use of the safety valve or whistle, another one can be so run, with the exercise of an equal care and vigilance on the part of the engineer and fireman. This matter of waste at the safety valve and whistle seems to rest entirely with the men upon the foot-board of the engine, and as they prize their good standing as engineers and firemen, they should attend to it.

**WARNING THE PISTON.**—The use of the steam-jacket in connection with the cylinders of steam-engines and the advantages attendant thereupon are well known, but the diagrams taken by the dynamometer show that a large amount of condensation still takes place; a portion of the condensed steam in the cylinder is evaporated anew during the expansion and another very important portion is also evaporated; but by taking the heat from the surrounding parts of the engine, thus causing a rapid cooling of such parts, those parts which are immediately surrounded by the steam-jacket are instantly reheated; but those parts which are not so surrounded, such, for instance, as the piston and rod, are relatively cold on the arrival of the steam in the cylinder, and they therefore condense a large portion of it before they arrive at the same temperature as the steam which flows in. The object of the invention of Madam Veuve Andre, of Thann, Alsatia, is to avoid this latter condensation, such object being attained by forming the piston and piston rod hollow, the spaces in the two parts being made to communicate with each other. Steam is introduced into the piston and rod through a pipe which is attached to the piston and passes through a stuffing-box in the end of the cylinder. This pipe slides in a steam-supply pipe, which is provided with a stuffing-box, and has an inlet for the admission of steam and an outlet for the condensed steam. The outlet may communicate with a pump to draw off the condensed steam.

**CARDING BUTTONS.**—Charles Kellogg, an ingenious mechanic and inventor of North Amherst, has for the last year been engaged in building a machine for fastening buttons on to cards, a process heretofore done by hand with a needle and thread, a day's work being about 40 gross for a smart workman. The machine is calculated to fasten one gross per minute on cards containing two dozen each, or 60 gross per hour. It is about two feet long and 15 inches wide, and as many high, and fastens the buttons to cards with fine wire. Four buttons are fastened or wired at a time; the card moves along and four more are wired, and so on until the required number are on the card, when another card is pushed along from the top of a pile of 200 or more on the machine. One girl can attend to each machine. This machine, besides the model for the patent office, costs \$1,600, though the duplicates can probably be made for \$300.

**USE OF THE TELEPHONE.**—During a recent visit to Cleveland, says the *American Manufacturer*, we found the telephone in use in a number of offices, and conversation being carried on between them and their manufactories at distances varying from one to seven miles, this, too, in an ordinary voice, with no particular effort except for distinct pronunciation. The Cleveland Paper Company has fairly domesticated this new discovery in their offices in connection with their different mills. It is also in use by the Standard Oil Company, Union Iron Works, Cleveland Transfer Company, Cleveland Iron Company, Leader Printing Company, Rhodes & Co. and other firms, while orders are being filled as fast as it is found convenient to do the work.

**SAW-SET FOR RIBBON SAWS.**—The Chemnitz tool factory, Chemnitz, Saxony, makes a mechanical saw-setter which acts as follows: On turning a hand-wheel motion is given to two levers, standing opposite each other and perpendicular to the saw, the steel point of one lever taking a tooth on the right side of the saw and the point of the second lever a tooth immediately in advance of the other, to the left. These two levers being lifted off, a third, acting parallel to the length of the saw, takes it a couple of teeth further on. This action is repeated on each revolution of the wheel and results in a very uniform setting of the teeth of the saw.

## SCIENTIFIC PROGRESS.

## A Mountain Dismembered.

An interesting account of the recent falling of a mountain in Tarentaise, Savoy, causing disaster to two flourishing villages, has been communicated to the *Courrier des Alpes*, by M. Berard. The phenomenon has been incorrectly reported as instantaneous and the destructive effect complete; whereas the case is that of a mountain, which, for 20 days without cessation, has been dismembering itself, and literally falling night and day into the valley below, filling it with piled-up blocks and stones, extinguishing all sounds by its incessant thunder, and covering the distant horizon with a thick cloud of yellowish dust. The entire mass comprised in the slope forms a mutilated cone 200 meters broad at the top, and 600 at the base (the slope being about 50°). This is composed of blocks of hard schist, lying close together, but no longer united; and it is united to the body of the mountain only by a vertical mass 40 to 50 meters thick, which already is fissured and shaken. Periods of repose occur, lasting only a few seconds or a minute at most; then the movement recommences, and continues about 500 hours. Blocks of 40 cubic meters become displaced with no apparent cause, traverse the 1,800 meters of descent in 30 seconds, leaping 400 or 500 meters at a time, and finally get dashed to pieces in the bed of the torrent or launch their shattered fragments into the opposite forest, mowing down gigantic pines as if they were so many thistles. One such block was seen to strike a fine fir tree before reaching the bridge between the villages. The tree was not simply broken or overthrown, but was crushed to dust (*volatilise*). Trunk and branches disappeared in the air like a burning match. Rocks are hurled together and broken into fragments, that are thrown across the valley like swallows in a whirlwind. Then follow showers of smaller fragments, and one hears the whistling sound of thousands of pebbles as they pass. M. Berard reached the edge of the rock (2,460 meters high) on one of the sides of the falling cone and ventured along it, obtaining a good view of the "terrifying" spectacle. He reaffirms his conviction that the phenomenon is inexplicable by any of the usual reasons that account for Alpine disturbances—such as penetration of water, or melting of snows, or inferior strata in motion; nor does the declivity of the slope explain it. His hypothesis is that some geological force is at work, of which the complex resultant acts obliquely to the axis of the mountain, and almost parallel to its sides.

## Test for Flour Adulterations.

From the *London Corn Trade Journal* we learn that Dr. Hinly, professor of chemistry at the University of Kiel, has suggested a method by means of which any person of ordinary intelligence may test the amount of adulteration of flour. It is based upon the fact that chloroform is specifically lighter than nearly all the substances usually employed for these adulterations, such as lime, chalk barytes, plaster, marble, bone-powder, etc., while the genuine flour is again lighter than chloroform, in which none of the above-named substances are soluble. The testing process is simple, and all the apparatus required is a small test tube about three-eighths of an inch in diameter and four or five inches long. A teaspoonful of the flour to be tested is placed in the test glass and chloroform poured on to fill the vessel to about three-quarters of its length, when it is well shaken, and then placed in an upright position, so as to remain undisturbed until the various substances mixed together have had time to find the level assigned them by their specific gravity, the flour swimming near the surface at the top of the vessel, while the mineral bodies will sink to the bottom. It should be observed that undiluted flour often shows a slight filmy deposit of a greyish or brownish color, which it must be supposed is stone-dust produced in grinding. A white deposit, however, will invariably indicate an adulteration with one or another of the substances mentioned above. If the materials are weighed before and after separation, the amount or degree of adulteration may be pretty accurately ascertained.

**MERCURY IN JAPAN.**—According to Mr. Plunkett, cinnabar occurs in two localities in Japan, but neither of these deposits are now worked. One mine in the northern part of Nippon is said to be very promising, but the present proprietors are not now inclined to expend money for its development. The other mine is near Ainoura, on the peninsula of Hirado, in Matsura kori of Nagasaki ken. Mr. Gower, who formerly superintended the working of this deposit, reports it to be valuable. The mine was opened under his direction some years ago, and a retort furnace was erected for the distillation of the metal from the ore. The furnace was worked successfully, and mercury was produced in some quantity. During the absence of Mr. Gower, however, the workmen by careless firing, melted the iron retorts, and, discouraged by this accident, the owners decided to abandon the undertaking. The cinnabar occurs here as a local impregnation in sandstones of the coal-measures, and filling small seams and fissures in the rock.

## Permeability of Walls.

Experiments by Profs. Marker and Schultze show that under some circumstances the passage of air and gases through walls and brick work is by no means difficult. All that is necessary to promote the passage is a difference of temperature of 10° between the inside and outside air. The figures given are as follows, per hour, for each square yard of wall surface: Through sandstone, 3.7 cubic feet; through quarried limestone, 6.5; through brick, 7.9; through turfy limestone, 10.1. This fact of the penetration and flow of gases through stone has one important bearing on the construction of wholesome residences. Most people are under the impression that if a cellar is lined with Portland cement, the dampness and malaria of the earth beneath will be shut off. If not in some way prevented, earth vapors pass upward into the building, and that part of the process is usually hastened in the winter months by a furnace in the cellar. Doubtless many malarial diseases, such as typhoid fever and diphtheria, may thus be propagated in cities, especially where the building sites are imperfectly drained or are "made ground." The experiments referred to are an additional proof that a Portland cement lining will not cut off the malarious gases, as indeed might also be inferred from its porous character. The only effective barrier against foul air and dampness must be some substance which is not permeable. Probably this result might be attained by means of a layer of asphalt or bitumen, if it were evenly spread, and weighted so as to keep in place. In view of the estimate that half the diseases of mankind are preventable, it is not too much to hope that modern sanitary improvements may largely reduce the death rate in cities; with many residences the improvement needs to begin at the bottom.

**AN INSTITUTION PROPOSED.**—The address of Prof. E. C. Pickering, as Vice-President of the American Association, was read by proxy, as he did not attend the Nashville meeting. The address, says the *Iron Age*, was an argument in favor of the endowment of scientific research. Its most interesting portion was the description of a suitable building and arrangements for a physical laboratory, where experiments might be made to carry out scientific researches. Prof. Pickering gave elaborate details of his project, and pointed out the numerous advantages that might be expected to result when these facilities were afforded to investigators. The plan includes the appointment of a presiding officer and a staff of assistants. The "castle in Spain" of Prof. Pickering is not a thing of beauty. He says: "The building itself is large but low, and resembles one or more blocks of two-story dwelling houses. No more common mistake is made than in wasting the money which should be used for equipment on architectural effect. It is useless to hope for architectural heauty in this building."

**MEANS OF PRESERVING MILK.**—At a recent meeting of the American Dairymen's Association, Prof. Caldwell, of Cornell University, read a paper entitled "Boric Acid and other Substances for Preserving Milk." Prof. Caldwell spoke of various substances for this purpose. He had tested various antiseptics for the preservation of milk, and found that boric acid was better than anything he had tried. When milk soured in from 20 to 24 hours, at a temperature of 80° Fahr. and upward, one part of boric acid added to 500 parts milk caused it to remain sweet for 50 hours. At a temperature of from 72° to 79°, one part of boric acid to 1,000 parts of milk, by weight, kept it sweet 50 hours. He applied it to milk warm from the cow, and thus preserved it twice as long as it would keep without it. No injury to the quality of the milk occurs in using one part of boric acid to 1,000 parts of milk. He stated that it was not a poisonous substance; he had taken the milk thus preserved into his own stomach and experienced no harm therefrom. One pound of boric acid to 1,000 pounds of milk will keep it sweet twice as long as it would keep without it.

**METALLURGICAL REVIEW.**—We have received the first issue of a new publication, the *Metallurgical Review*, by David Williams, 83 Read street, New York. It is of fine appearance and well filled. The *Review* is intended to be a record of current progress, which shall combine the enterprise of a newspaper with the convenience and permanent value of a book. It will contain original contributions from writers of known ability and recognized scientific standing, American and foreign. Its field includes whatever is new and important relating to the metallurgy of the useful metals, from the mining of ores to the final processes which make the metals available as materials in the arts.

**NEW BIRD.**—Prof. O. C. Marsh announces a new genus and species of toothed bird, which he calls *Baptornis advenus*. He also describes a new fossil lizard, by far exceeding in magnitude any land animal hitherto discovered, which must have been fully 50 to 60 feet long. It was probably a herbivorous reptile. It comes from a bed on the eastern flank of the Rocky mountains.

# MINING SUMMARY.

The following is mostly condensed from journals published at the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**ECUPE.**—Amador Ledger, Sept. 22: The hoisting works of this mine are fast approaching completion. It is the intention to work by steam power, and, if everything goes along satisfactorily, the works will be started in three weeks. The Eclipse joins the Keystone. In fact, one of the tunnels of the Keystone has passed over the boundary and explored the Eclipse ground to a distance of 130 feet, showing a good-sized ledge of excellent rock. This is at the 300-ft level. The shaft of the Eclipse is down at present 120 feet. It is contemplated by the managers to sink 130 feet more, to the 300-ft level, where good rock is known to exist. Sufficient rock has been sold to enable work to be prosecuted for some time.

**CROWN POINT.**—The last clean-up at the Crown Point mill, at Drytown, averaged 70 per cent. This is better than any previous run, and leaves a handsome margin of profit. The mill is shut down in consequence of the failure of water.

**MILLS RUNNING.**—There are only four mills running at the present time in the county, namely, the Keystone, Amador Con., Onella and Tallman. The water in the Amador canal is not sufficient to run more. There are only about 500 inches flowing through the ditch.

**CENTENAL.**—This is a very promising location on Dry creek, between the Gover mine and Plymouth. At the depth of 70 feet from the surface a ledge eight feet wide was met with, which prospected exceedingly well, making the hopes of the owners to the highest pitch. It was thought advisable to continue sinking, not exactly following the course of the ledge. The shaft reached a depth of 150 feet, and the men are now drifting to strike the ledge at that depth.

### BUTTE.

**RIVER MINING.**—Oroville Mercury, Sept. 22: A. Nelson and H. Wallis have put a wagon on the river, about five miles above town, and have got the bed completely dry. They are now engaged in washing up the river bed. They find some eight or nine feet of gravel before reaching the bedrock, but it all pays well to run through the flume. They will make a good stake if the river does not rise this month. At one place on the bedrock they got a small flow, much more of such earth remains is a question that interests them very much. We hope to hear that they have found it in large quantities.

### CALAVERAS.

**RICH STRIKE.**—At Mokito.—Calaveras Chronicle, Sept. 22: Mokito gulch takes precedence of all other mining camps on the Pacific coast for frequency and richness of "strikes" in quartz. Scarcely a week passes without some new discovery being made, and the camp is to-day really one of the liveliest in the middle or southern mines. We are pleased to learn of a rich strike lately, in the well-known Monte Cristo, owned by Messrs. Longley & Co. At a depth of 180 feet the men have uncovered a large and extremely rich body of ore, and a large force of hands have been set at work taking it out. The Monte Cristo has paid largely in the past, and the indications are good that it will pay Longley in the future.

**GRAVEL CLAIM.**—Calaveras Citizen, Sept. 22: The Alta gravel claim, owned by Honey & Co., near Reynolds' Ferry, is being vigorously worked by a dozen hands, and is making out \$5 per day to the owner. The owners are assured that this is one of the best claims in the county, from the fact that it is well prospected and shows abundance of gravel which will last for years. The owners do not wish to sell.

**TOO SMALL.**—Steam was got up at the Plug Ugly claim last Wednesday, but it was soon found that the engine was not powerful enough to do the work. It is now proposed to get a boiler in addition to the one connected with the engine, which will furnish steam enough to run the works.

**HALL CLAIM.**—Amador Ledger, Sept. 22: F. C. Hall is working a quartz lead named after him at West Point, Calaveras county, with most gratifying results. The ore body varies from 16 inches to 24 feet wide, and carries a handsome percentage of gold. Two crosscuts have been run, one an average of 812 and 815 per ton respectively. There are 25 tons of still richer rock in sight. Good judges say that it will average in the neighborhood of 500 per ton. The gold is also of superior quality, commanding \$17.32 per ounce at the mint. Mr. Hall is largely interested in other mines around West Point, which are not at present in active working.

### FRESNO.

**DITCH.**—Fresno Republican, Sept. 27: A party of men are constructing a ditch from the San Joaquin river, above Millerton, for the purpose of mining a gravel bank above the old town.

**PROSPECTIVE.**—Several parties are opening deep claims some 15 miles above Millerton, having put in two large chain pumps, run by a water wheel, and about 12-horse power, to get rid of the water. They are almost ready to commence sluicing, with the prospect of a splendid return. Quite extensive prospecting has been done during the summer on the upper Kings river, and some fair diggings have been found, though there has been no excitement. A gentleman has brought in some specimens of quartz from the vicinity of the great canyon of the Sacramento, last week, which are rich in copper, and some of them show evidences of both gold and silver. The mining resources of this county are not developed, but they will evidently become of more importance than ever before within a very short time. The amount of gold dust shipped away from here now by Chinamen is much larger than is generally supposed.

### NEVADA.

**GOOD ROCK.**—Nevada Transcript, Sept. 23: The New England is now taking out some most beautiful looking rock. It is richer than any ever before seen in the mine. They expect to commence soon to take out about 30 tons per day. They have about 50 or 60 tons on the dump, and will have mother crushing shortly.

**THE MACHINERY.** for the mill of the Pioneer reduction company is nearly all on the ground. The company expect to be in full operation by the middle of October.

**JOE.**—A mining superintendent, who has resided in this county for 10 or 12 years, informs us that he never saw a time before when there were so many idle miners as now. He has had applications for work from at least 100 men during the past few weeks, and a large number of them have families to support. It is so all over the State.

**BLUE TENT.**—The Blue Tent gravel mining company made their clean-up for the season a short time since. They took out more money than usual, and expect to increase it largely as they have the water in preparation. The company are being made for more extensive work than ever before. The company are now engaged in fitting up their claims, and expect shortly to put off a blast of 1,500 kegs of powder. With probably one or two exceptions, this is the most extensive gravel mine in the State. J. Courtney, Esq., of the Fresno office of the company, is expected here this week. The company was organized by Mr. Courtney, who is owned wholly by an English company, and they have caused to be pleased with their investment. They have spent an enormous amount of money in fitting up the claims—building ditches, reservoirs, etc. A contract was let a few days ago to build a new reservoir, which will cover eight acres of ground. The work will be pushed through as fast as possible, so the company will have the use of it as soon as it is needed.

### SAN BENITO.

**QUICKSILVER.**—Hollister Enterprise, Sept. 22: By reliable parties, who have visited the Stanton mines, this week, the report of the rich cinnabar strike is confirmed. The

shaft in which the strike has been made is down 100 feet. It was sunk upon a vein of paying metal all the way. At that depth a drift was cut north and south 60 feet and east and west 30 feet, disclosing a solid face of good ore in every portion. A retort of 300 pounds of plucked ore was made, which yielded 143 pounds of quicksilver. Tons upon tons of ore, metal are in sight in the drifts. This is decidedly the best and most substantial strike that has ever been made in any of the Coast range mines.

The Consolidated Wonder company has been pushing work along on their claims pretty lively lately, and the recent strike in the Stanton mines has lent the management considerable encouragement. The prospects are flattering, as they have struck the same indications which lead to the bonanza in the Stanton mines. Work on the Consolidated mine will be suspended for 30 days, in order to prepare for winter—building cabins, ore sheds, etc. Situated as it is, between the Stanton and Salinas mines, both of which have demonstrated their richness, it would be difficult to imagine how the Wonder can escape being a rich property.

### SAN DIEGO.

**NEW LOOK.**—Los Angeles Herald, Sept. 22: We were shown some specimens of gold-bearing quartz taken from a new lode recently discovered in the Carga Muchacho district, on the Colorado desert. This district is located in San Diego county, within three miles of the Southern Pacific railroad, and about 15 miles from the Colorado river. About two miles up three claims, the Madre Padre and Carga Muchacho, purchased by a Mr. Van Arsdale for \$5,000, were sold in San Francisco for \$35,000. The specimens exhibited to us show free gold, and were taken from a ledge two feet wide, which has been traced for over half a mile. The surface rock assays about \$70 per ton.

### SIERRA.

**BOIT STAMPS.**—Mountain Messenger, Sept. 22: We are informed by a friend that Fletcher & Co., of Sierra Valley, have erected an eight-stamp battery at their mill on the west side of the valley, and now have it running on good-looking quartz, which they found in that neighborhood. Samples of it handed us clearly resemble the fabulously rich Mispick's ore of the North fork, at Forest City. This discovery has been kept remarkably quiet, we having heard nothing of it until a few days since. Free gold is visible in the specimens we have, and the rock is undoubtedly rich. If they have much of it, they have a good thing, although we doubt if they can save the gold by the ordinary mill process. The rock is also similar to the Dolly Varden sulphurates.

**PROSPECT.**—Wm. Wilborn and A. Dennire have just struck a fine prospect in Hog canyon. They have taken out as high as 20 to 25 pounds of dirt. They have been hauling 500 hundred pounds at a load on a sled to water, working it with a rocker, making from \$50 to \$60 per day. The ground in the ravine and flats above is owned by the Tennissin company. These persons are working about 400 feet below the Tennissin line.

**THE OUTLOOK.**—The mining outlook in this county has never been better. In all directions we hear of striking good prospects and good pay. Dick Williams and Henry Hartling are finding the richest indications, their claims south of Whitney's mill, at flower ranch. Johnson & Co. are getting good pay on the point above Kanaka creek, about a mile or mile and a half from the Pileocene shaft. Bob Buzan is taking out good pay at his claims, so we learn. Wilborn is putting down a shaft on Thompson ridge, and will soon commence working double shifts on account of the rich ore. They are now sinking a shaft, and being so successful, in that it has induced men out of work to go to prospecting. This country is not half prospected yet.

**BALD MOUNTAIN COMPANY.**—The Bald Mountain company are still rolling out the gravel and rolling in the supplies. Timbers are arriving at the rate of 10 or 12 loads per day, besides other supplies from below. I saw a stationary car-wheels, one revolving axle, with oil-cell boxes attached to the axle, and a large number of oil-cells, which is a new feature in the construction of mining cars. I was informed by Superintendent Wallis that all the cars are to be overhauled and this improvement made at once. The object is to get a steadier running car, and reduce the expense for oil, which in the past year has amounted to over \$1,250. They are also economizing in the wear and tear of the cars, by putting a braze-man on the trains, thus enabling them to take a greater number of loads, consequently making a less number of trips.

The North Fork company are still pushing ahead for their gravel lead, which I am informed has already been struck in their air-tunnel. They are also sinking near the ledge, with confidence of again striking it rich when the ledge is reached. I have no doubt, under the management of this new Superintendent, Mr. McDougal, the company will eventually be taking out hundreds of dollars worth of trips.

### SHASTA.

**SOUTH.**—Yreka Union, Sept. 21: Eastern capitalists have purchased the Conklin & Magee placer mine, known as Old Hill, in Shasta county. This claim embraces 160 acres, and is one of the finest gravel beds in the county. The small portion of it which has been worked has paid splendidly, but the great drawback in working the ground has been the difficulty of getting a good supply of water to run the works. I have no doubt, under the management of this new Superintendent, Mr. McDougal, the company will eventually be taking out hundreds of dollars worth of trips.

### TUOLUMNE.

**OHIO MINE.**—Union Democrat, Sept. 21: The hoisting works at the Ohio mine were totally destroyed by fire the 10th day of August. Under the superintendence of H. A. Smith, the work was pushed forward, and on Saturday, which is excellent evidence of the richness of that gentleman. Monday morning, work was resumed sinking the shaft, interrupted by the unfortunate accident that has cost so much time and money. It is expected the lead will be reached in three weeks, when crushing will immediately ensue. Where the shaft will reach the lead, it is 22 inches in width and yields 840 rocks per ton. I have no doubt, under the management of this new Superintendent, Mr. McDougal, the company will eventually be taking out hundreds of dollars worth of trips.

**GOLDEN ROCK MINES.**—Tuolumne Independent, Sept. 22: These mines are situated in this county, on the road to the Yosemite falls, about 12 miles north of Groveland, and are owned by a company of English capitalists, Caleb Dorsey, Esq., of this city, being the Managing Agent. The company are now opening another claim about five miles below the old workings, on the same gravel range. This will give them an open dump at the river side for the whole range of claims. In the cut, at this point, they will have a hydraulic pressure of about 200 feet, with a gravel ranging from 70 to 200 feet high, all paying good gold. The new claim is much richer than the claims worked last winter, and is supposed to be richer gravel. With the fall they now have, each hydraulic will perform three times the work of those used last season, which had only a pressure of 84 feet. Four "Little Giants" will be used this winter, and we expect "judging" from the prospects of the past and considering the richness of the mine, and the great quantity of material. The contracts are already let for widening out the old ditches and making new ones, and some 40 men are at the work. Superintendent A. C. Clark is expected to get up a crew of 30 men to aid in the construction of flumes, repairs, and to fix for laying the iron pipes, etc. They expect to be ready for active operations by November 1st, when they will have a large quantity of material. The contracts are already let for widening out the old ditches and making new ones, and some 40 men are at the work. Superintendent A. C. Clark is expected to get up a crew of 30 men to aid in the construction of flumes, repairs, and to fix for laying the iron pipes, etc. They expect to be ready for active operations by November 1st, when they will have a large quantity of material.

**YUBA.** **SAND FLAT MINING.**—Marysville Appeal, Sept. 21: A few of our enterprising citizens have brought down from Oroville the machinery of the pioneer mining boat of the Feather River company, and are now putting the same in order at the Empire foundry, with the intention of operating it in the bed of the Yuba river, about half a mile below Sand Flat. The present movement is a prospective enterprise, and if the owners find it profitable, more extensive machinery will be erected. Sand Flat and the face of the hills on the north and south of the river are about to be thoroughly prospected. Some of the hills on the north side have already been worked to some extent. A Chinese company have a claim they are drifting from the bedrock, wheeling the dirt down the river 20 yards, and washing in rock and dirt, under all these disadvantages, it is reported the Chinamen realize from \$3 to \$5 to the day. On the south side of Sand Flat, upon the first bench of gravel, two companies are sinking inclines, with the intention of going to the bed in the river or in the hills. One of these companies have erected substantial and costly machinery, and have two 10-hp pumps running to keep their shaft dry. This company have been raising pay dirt for some weeks and expect to go to washing this week. Sand Flat is a rich mining territory, but its advantages for mining have been destroyed by the debris from the Smartville mines.

## Nevada.

### WASHOE DISTRICT.

**BECKER.**—Gold Hill News, Sept. 26: The main drift south at the 1000-ft level is steadily being advanced, and the face continues in favorable vein matter, composed of ledge porphyry, with streaks of quartz. The connection between the Belcher and Crown Point shaft and the south drift at the 2000-ft level of the Crown Point mine was completed this morning, and a very valuable and much-needed circulation of air is thus established, which will much facilitate the working and development operations of both mines.

**GOULD & CURRY.**—At the 1000-ft level the drift south to connect with the drift coming north from the Savage joint winze at the same level is advancing slowly, in hard, unfavorable working ground. The heat is very great in both drifts. The increase of water gave considerable trouble, but this difficulty is obviated by increased pumping facilities.

**JULIA.**—The main drift east from the winze, at the 1500-ft level, is in a fine quality of vein matter, which gives good promise of an ore development in that direction before long. The prospects for a good paying ore development at this level are very flattering.

**UNION CONSOLIDATED.**—Still repairing the main crosscut on the 1000-ft level, when the face will be reached and drifting ahead resumed. The cross-cut being run east and west from the main drift on joint account at the Mexican line are advancing well, with the faces in promising vein matter.

**UTAH.**—The main south drift at the 1150-ft level is still pushing ahead in quartz, and has about 240 feet yet to run in order to reach the south line. The drift is, at this level, steadily advancing in favorable ground. The vein at this level is over 100 feet wide, of solid quartz, which gives low assays, and should contain a bonanza of concentrated ore somewhere.

**BEST & BELCHER.**—The bottom of winze No. 2 below the 1700-ft level continues in hard blasting rock. Work will be resumed at the 1500-ft level day after tomorrow. As soon as the connection is made between the Gould & Curry and Savage at the 1000-ft level, which will be in about 10 days, drifting north will be resumed in the Best & Belcher, at the same level, for a connection with the Consolidated Virginia.

**CHOLLAR-POTOSI.**—Daily yield 80 tons of ore, assaying \$22.50 per ton on the average. The main drift east, at the 1750-ft level toward the combination shaft, is running in tough, unfavorably working material, which shows on being opened to the air, requiring constant timbering.

**SUCCESS.**—The indications at the bottom of the shaft are of a decidedly favorable nature, good streaks of quartz continually coming in.

**CONSOLIDATED VIRGINIA.**—Daily yield, 550 tons, principally from the 1650-ft level, aided by good contributions from the 1200, 1300, 1400 and 1500-ft levels, and what ore is removed in prospecting and opening out the 1750-ft level. The ore breasts and stopes of the three upper levels mentioned are looking fairly, and in the 1500-ft level the ore stopes to the southeast are giving an excellent showing. At the 1650-ft level considerable improvement is met with, as the stopes are extended southward, both in quantity and quality. The main drift west from the C. & C. shaft is being steadily pushed ahead to connect with the shaft, which is being continued downward below the 1500-ft level. Since last week's report this drift has passed out of the west ore vein and is now running in ledge porphyry, with occasional streaks of quartz. This shows the west ore vein to be about 50 feet wide. Some of the ore gives good returns, but the vein does not average as well as the other two veins passed through and being worked at this level. At the 1750-ft level the main drift south, which recently made connection with the north drift from the shaft at the 1650-ft level, is being continued south directly over the Gould & Curry drift. It is some 10 feet above it, but it is necessary to carry the sill floor through this in order to run the ore out to the C. & C. drift. Cross-cutting both east and west is now being done to test the width and value of the ore vein.

**CALIFORNIA.**—Daily yield, 675 tons, principally from the 1500 and 1600-ft levels. Some 30 or 40 tons per day come from the 1400, and 200 or 300 tons daily from the 1650-ft level. The ore breasts of the 1550-ft level show considerable improvement since last week's report, and the same may be said of the 1600-ft level, in extending the sill floors west, south and east. The connection of winze No. 5 with the 1840-ft level drift from the Ophir mine gives a splendid ventilation, a strong volume of fresh air coming through from the shaft at the 1650-ft level. The vein cross-cuts are making good progress, also the winzes below. The main west drift from the C. & C. shaft having passed entirely through the west ore vein, is now in porphyry and quartz. A vast amount of rich ore is developed at this level; much more than is needed with the present milling capacity. Twenty more stamps are about to be added to the crushing department of the Consolidated mill. At the 1750-ft level the main west drift from the C. & C. shaft is now in past the winze 76 feet, with its face in a porphyry vein, but it is expected to cut through into the west ore vein in a day or two.

**YELLOW JACKET.**—On the 2200-ft level the east drift toward the new shaft is now in 342 feet; material in face, ledge porphyry, with seams of quartz. The main south drift, at the same level, is in 301 feet to-day, with its face in quartz, carrying some ore. The drift north toward the Imperial is in 116 feet, face in porphyry. No water of any account is met with at this level as yet. At the new shaft sinking continues suspended until the new and powerful hoisting works can be completed and started into active service. This will be in about a week or 10 days, when the shaft will be kept reduced in the shaft by means of the donkey engine.

**JOE SEATES & GEORGE DOUGLASS.**—The joint shaft is down, to-day, 210 feet. It is well timbered throughout and provided with safety ladders. The station at the 200-ft level is completed, and, day before yesterday, drifting west from it to cross-cut the ledge at that depth was commenced. Good indications are of a very favorable character for finding pay dirt at this level before the west shaft is reached. A neat little assay office is just being completed in the south wing of the main building.

**CROWN POINT.**—The connection between the south drift, at the 2000-ft level, of the Crown Point and the Belcher and Crown Point shaft was completed at six o'clock, this morning. A good current of air is passing through, and the level of the water in the shafts is being lowered. The ore is being raised to come from the 160-ft level. This part of the mine having been worked out years ago, it is not known whether the ore struck at this point is the remnant of a worked-out body or something new. The ore goes \$30 to the ton, and the streak is about nine feet wide. It is proposed to further prospect by running under the present workings, which are very promising.

**JUSTICE.**—About 400 tons of ore a day are being taken out from the regular producing sections, from the 700 to the 1000-ft level. The breasts and stopes continue looking well, and are yielding the usual quality of ore.

**NEW YORK.**—Sinking the main shaft deeper below the 500-ft level progresses at a good rate, the bottom being in favorable working ground. The material is ledge porphyry, with streaks of quartz and clay. Some little increase of water is met.

**MEXICO.**—On the 1465-ft level, the joint Union-Mexican cross-cut east and west, being run from the main drift, are making good progress, with the faces in promising vein material. On the 1000-ft level the drift is in the west canyon, showing very favorable vein matter.

**EXETER.**—On the 2000-ft level the drift is in the west canyon, showing very favorable vein matter. The drift is making fair progress, without any material change in the formation encountered.

**HALE & NORCROSS.**—The pumps are running steadily as usual, keeping the water reduced as much as practicable, and as soon as the Savage pump is also in working condition again, it is thought that the water will be speedily reduced to the lower levels.

**SERRA NEVADA.**—At the 1750-ft level the drift south from the shaft is driving ahead, and the winze being sunk from the 1500-ft level to connect with it is making excellent progress.

**SILVER HILL.**—The new incline pump operates finely in freeing the mine from water, and work is resumed at the 650-ft level, pushing the drift north in very favorable vein matter.

**BULLION.**—On the 2000-ft level the combination north drift is getting into soft vein matter, which requires very close timbering and greatly retards the work.

**ORION.**—On the 1000-ft level the face of the south drift is in the ore vein. The east and north drifts are still in the west canyon rock. Splendid progress is being made in all these drifts. At the 1700-ft level the face of the drift is at the Mexican line, is making good downward progress in favorable ground.

**SETTLE TUNNEL.**—The face of the leader continues in soft porphyry, clay and other difficult and unreliable ledge matter, requiring careful and close timbering, consequently the advancement is considerably impeded and slow at present.

**LADY BYRAN.**—The new machinery has been started up and operates finely, coming fully up to the expectations.

**SAVAGE.**—The new pump rod is completed and in place. It is composed of 20 tubs, each 60 feet in length and 14 1/2 inches square. Each section when ironed weighs about 4,000 pounds.

**MAXAM.**—Drifting east and south on the 1400-ft level, with no change. Cross-cutting on the 1300-ft level continues in about the same character of ground.

**ALTA.**—Cross-cutting is commenced on the 1050-ft level, and important ore developments may be shortly expected, as the main drifts north and south at that level have been skirting the wall of the vein for some time.

**LEVATHAN.**—The work of putting up the new hoisting or follows frame is being pushed ahead. It is expected to be finished by Monday.

**IMPERIAL CON.**—The south winze from the 2135-ft level is going ahead as usual, with no material change.

**HOMESTEAD.**—The entire bottom of the main shaft still continues in a fine character of vein material.

### BRISTOL DISTRICT.

**BRISTOL DISTRICT.**—Pioche Record, Sept. 22: Prospectors, and those desirous of viewing the Jackrabbit mine, have been flocking out in that direction during the past week. Most all of those who have discovered ledges have good prospects, showing fair ore. Prospectors are extending their operations to Fairview, distant about 30 miles from the Jackrabbit mine. Fairview is the springs from which the supply of water for Bristol is obtained; these springs having been cleaned out by N. M. Miller and his sons, they are engaged in hauling water to supply the Jackrabbit and other mines around. A fine map has been made of Royal City, and as soon as the lots and blocks are staked off, according to the map, lots will be for sale.

**NO WORK.**—Owing to the bonding of the Jackrabbit mine no work is being done on it until the 30 days for which the bond was given expire.

### EUREKA DISTRICT.

**ACTIVE.**—Eureka Sentinel, Sept. 10: Never in the history of the district has there been more extended operations on the great mineral belt, or the same amount of activity displayed by mine owners in developing and prospecting their several properties than at the present date. There seems to be a general revival all along the line, and owing to discoveries made, confidence in the main stay of our prosperity once more restored. Location on the main belt to be the lode, extending from the Richmond on the north to the Hoosac on the southern end, have become of great prospective value, while on the claims that have been worked to any extent, new ore bodies have been met with that reward the faith of those who have expended time and money in the underground workings.

At the Richmond the exploitations in the western part of the mine carried on in the last six months, have opened out extensive and rich deposits of sufficient capacity to furnish work at the smelters for a year to come.

The K K yields its 60 tons per day with the regularity of clock work. It is expected that new developments will soon be made on the seventh level.

His busy notes of preparation can be heard at the Jackrabbit mine, where the information from the best of authority that the extraction of ore from the recently discovered bonanza on the 450-ft level will commence on the first of October.

The space between the Jackson and Bald Eagle, hitherto unexplored with the exception of some mere scratching on the surface, is coming to the front, and several shafts are being sunk with a view of determining its value.

The Bald Eagle has recently come into prominence. An average of 10 tons daily is sent to the Richmond furnaces, and the yield aggregates \$170 per ton, gold and silver.

The Atlas is lying idle at present, owing to litigation, and it is not probable that operations will be resumed before the spring.

The first of October will witness a renewal of ore extraction at the Hamburg. All of the connections will be made by that time, and the owners feel satisfied that the ledge will yield large quantities of precious metals.

Work is progressing at the Hoosac, both on the new shaft and in the old workings. Quite a large amount of ore has been taken out lately, and piled on the dumps. As soon as the new shaft reaches the required depth, drifts will be run and the ore bodies developed.

It will be seen by the above brief resume that the outlook for the future is a very bright one, and we can but conclude in glancing over the field that the busiest season ever known in Eureka is upon us.

### ELY DISTRICT.

**BULLION.**—Pioche Record, Sept. 22: \$19,043 in bullion were shipped by Wells, Fargo & Co. during the week.

**ALPS S. M. COMPANY.**—During the last three days there has been a marked improvement in the mines of this company. The ore body on the ninth level of the Maceppa mine has increased in size and richness, and sufficient ore is now being raised from this portion of the mine alone to run the company's mill to its full capacity. Two ore trains were sent over the N. C. R. R. to the Chicago mill during the past week, from this mine. Prospect in company's Alps mine is encouraging. Small veins of rich ore are being cut in south drift, second level, and main shaft in lowest level, south, is in good character of quartzite for finding ore.

**BULLION TAX.**—The bullion tax on the proceeds of the mine has been paid, as ordered collected by the Board of County Commissioners, was all paid by the mining companies during the week, \$51 only having gone delinquent. This is much better than having a long lawsuit in regard to the vexed question, as the finances of the Lincoln county will not stand any strain of that sort.

### OSCEOLA DISTRICT.

**A BEAUTIFUL SPECIMEN.**—Pioche Record, Sept. 22: We were shown, yesterday, by Mr. Poujade a very beautiful and valuable gold specimen from Osceola, taken from the

## THE ENGINEER.

## The Eddystone Lighthouse.

Not a little interest was awakened at the last meeting of the British Association, at Plymouth, by a very interesting paper on the Eddystone lighthouse, by Mr. Isaac Douglass, who surprised his hearers by announcing that Smeaton's great work was not destined to exist much longer. Owing to a very considerable tremor which occurred with each wave-stroke during heavy storms from the westward, fears had been entertained for the safety of the structure, particularly as sea-water had frequently been driven through the joints of the masonry. The upper part was strengthened in 1839 and 1865 with internal wrought-iron ties, extending from the lantern floor downwards to the solid portion of the tower. On the last occasion he found that the chief mischief arose from the upward stroke of the sea at the cornice, but repairs were effected, and further leakage prevented. The tower was still sound, but unfortunately the gneiss rock on which the lighthouse was built had been seriously undermined and weakened by the sea. This appeared to be chiefly due to the incessant straining of the laminated rock by the heavy sea-strokes on the tower. It had, therefore, been determined to erect another lighthouse of larger dimensions, for which a good foundation had been discovered about 120 feet off. The elevation of the light for a range of 19 nautical miles was very desirable, so that it might be extended more towards the Channel rock, and made to overlap the range of the neighboring Lizard lights to the westward. Unfortunately, the sea rose during stormy weather considerably above the top of the lantern, thus often eclipsing the light and altering its distinctive character. This was a matter of much greater importance in the present day than it was at the date of the erection of the structure, from the enormous increase in the number of shipping, and the additional light-houses which had been established, each having a distinctive character. The power of a light in so important a position ought to be raised to the first-class; but the capacity of the present tower was insufficient for this as well as for the provision of a first-class fog-signal. Telegraphic communication between rock lighthouses and light-vessels and the shore, for the purpose of reporting casualties at sea, was very desirable, but the difficulties which presented themselves appeared at present too considerable to justify the necessary outlay for construction and maintenance. Four lightkeepers were attached to the Eddystone, three being constantly on the spot, and one on shore in rotation. They were relieved from Plymouth monthly by a steam vessel. The average annual cost of maintaining the lighthouse was about £535. In conclusion, he could not help expressing a hope that if Smeaton's noble structure had to be taken down, as doubtless it would be after the erection of the proposed new lighthouse, the nation would consider it as worthy of a site on English soil as Cleopatra's needle.

**WATER VERSUS RAIL.**—As a means of affording increased facilities for competing with German commercial encroachments, important plans are contemplated in France looking to an extension of the canal system. It is a striking fact that these new facilities should be sought through canals rather than through railroads, in face of the common opinion that railroads have superseded the old-fashioned method of internal water carriage. We find in the French journals, however, says the *Coal Trade Journal*, facts which seem to throw light on this preference. The railroad men of this country will be surprised at the following statement, which we take from the *Paris Union Nationale*: "Our internal navigation is still vital enough to effect a saving to trade of 56,000,000 francs. The canals and rivers transported during 1875 1,721,000,000 tons of goods at the small cost of 4,177,940 francs. If these 1,721,000,000 tons had gone by rail, the charge would have been some 56,000,000 francs in addition."

The enormous difference here shown between canal and rail charges seems almost incredible; and yet it is clear that there must be some very substantial advantages in favor of water carriage, or the additional carrying facilities now desired would not be sought through constructing new canals. These facts deserve the attention of those in our own country who have so decidedly assumed that our State canals must inevitably be superseded by the railroads. For our own part, we have not yet reached that conclusion, nor does the present relation between the canals and the railroads warrant it.

**STEEL RAILS OF DOUBLE LENGTH.**—At the steel works of the Lackawanna Iron and Coal Company, in Scranton, Pennsylvania, a great improvement has been made recently in the manufacture of steel rails. Heretofore the rails have been turned out at the standard length, 30 feet, but they are now made in double bars, 60 feet long. The great advantage of making the double length instead of the single length lies in the saving effected in cutting off the cross ends of the rails, which is in itself a saving of about 50%. Although the bar is rolled 60 feet in length, it is too cumbersome to be easily handled in the laying of tracks, and is, therefore, cut in two as soon as rolled. The great advantage lies in the fact that there are only two ends to be trimmed in a length of 60 feet, instead of four, as formerly.

## Ancient Aqueducts.

Mr. J. H. Parker, in his book on the "Aqueducts of Rome," gives us some facts which may well put modern municipalities, not to speak of governments, to the blush. The exact quantity of water daily poured into Rome in Trajan's time is known from careful estimates of Frontinus, the head government surveyor and engineer. It amounted to 24,805 *quinaries*, a section of which amount would be just upon 120 square feet; i. e., in Mr. Parker's words, "we can form some notion of the vast quantity, if we picture to ourselves a stream 20 feet wide by 6 deep constantly running in at a fall six times as rapid as that of the Thames." It is calculated that, when Trajan's and the Aurelian aqueducts were finished, the daily supply was quite 332½ millions of gallons; i. e., at least 332 gallons per head, for the population of old Rome probably never exceeded a million. Nowadays 40 gallons per head per day are thought ample, and by many excessive; these 40 including, of course, all that is used in manufactures, in street cleansing, sewer flushing, etc. The site of old Rome was notably unhealthy, and there was much overcrowding; yet after the chief aqueducts were made, no city of antiquity was so free from epidemics. Another point to which Mr. Parker calls attention is the care with which the best water (such as the Marcian, now lately brought into use again) was kept wholly for drinking purposes, while the muddier and less pure (such as the Anio Vetus and Novus) were used for street and sewer flushing, for the baths, and for scenic representations.

**SHOOTING LIGHT.**—The *London Times* says one of the most simple and ingenious contrivances for the purpose of investing a fleet with a zone of light, through which no enemy could pass without being observed, has been devised by M. Ferdinand Silas, of Vienna. This consists of an inextinguishable lightning shell, similar to a common shell, which can be made to fit any gun, and can accordingly be projected to any distance. The projectile consists of three parts, one within the other. Within the shell proper is a lining of wet sponge, and within this is a glass bottle which fills the whole cavity, the bottom of the shell unscrewing to admit of its entrance. This bottle is filled with various charges of phosphide, none of which, however, is to be less than 10 pounds. A small channel is bored through the sharp point of the shell, in order to allow the air to mix freely with the wet sponge, and there are a couple of apertures in the head, which are plugged with wooden stoppers covered with leather. Through the movable bottom of the shell a steel striker is inserted, which is fitted with a spring and communicates with the glass bottle within. When the light shell is fired the spring striker is driven forward by the explosion, like a gas check, and so breaks the bottle; the water contained in the jacket sponge then penetrates through the broken glass and saturates the phosphide; phosphoretized hydrogen is immediately generated in large quantities, by the pressure of which the stoppers are forced out, and two streams of illuminating matter are poured upon the sea. The light burns with great brilliancy for a considerable time, and is claimed to be inextinguishable.

**SPAIN AND AFRICA.**—The Spanish engineers who are to undertake the work of the proposed international tunnel between Spain and Africa at the Strait of Gibraltar, have been at Marseilles several days. Their machines very much resemble those which are at present used at St. Gothard. The projected tunnel is to extend from within a short distance of Algiers, on the Spanish side, to between Tanger and Centa, on the African side. The length of the submarine tunnel will be nine miles, with an inclination of one foot per hundred. The approaches will have an extent of six or seven miles. The greatest depth of the sea is 3,000 feet. A thickness of 300 feet of rock will be left between the roof of the tunnel and the sea bottom, making the greatest depth of the tunnel 3,300 feet below the level of the sea. The cost is estimated at £4,000,000. By means of this tunnel and the one between Dover and Calais, travelers will be enabled to go from England to Africa by land.

**THEY ASK FOR MORE.**—New Orleans desires a shorter route to the sea than that formed by Mr. Eads by deepening the South Pass. It is proposed to dig a ship canal between New Orleans and Barataria bay—an estuary of the sea that penetrates far into the land on the south coast of Louisiana. The distance from New Orleans to the Gulf of Mexico by this route would be only 58 miles. The cost of digging the canal, it is estimated, would be \$5,000,000. Neither Government nor State aid is asked; the advocates of the canal solely ask Congress to grant them the right to use the tidal waters of Barataria bay.

**A TWO-FOOT CHEAP RAILWAY.**—The two-foot gauge railroad between Billerica and Bedford is making good progress, and will be soon finished. The passenger cars, now building at Laconia, N. H., will be a decided novelty, as they will have a row of single seats on each side. The road is eight and one-half miles long, and will cost about \$50,000, or less than \$6,000 per mile, being only one-eighth the cost of the ordinary railways.

## Lassen County Mining Interests.

It is a recognized fact, and one well established, that no agricultural community can prosper peculiarly unless an available market can be had for their products; particularly so where the scope of country susceptible of tillage is limited, and the surplus hauled by wagons long distances to enter into competition with those raised in the immediate vicinity of the market sought.

Where communities of this kind exist in mountain counties, isolated from lines of railway, the prosperity of the farmer and business man depends upon the number of employed consumers the country may be made to maintain, and their number can only be increased by opening new avenues of industry.

The particular case under consideration is our own productive valley, which is compelled to find a market for all its surplus at Reno. That this evil may be remedied is a fact requiring little or no demonstration, as the prosperous condition of the agricultural element in the foothills and mining counties where the mining interests have been developed will testify. In our own case we have in our immediate vicinity as sure a prospect for a basis of future prosperity as could be desired. There is abundant evidence of the existence of both quartz and placer gold in paying quantities; considerable placer gold having been worked to a good profit in early days. The quartz crops out as indisputable evidence of its own existence. A slight review of the history of mining operations in this county will suffice to show why this all-important industry has been allowed to decay. The class of men making the first discoveries were generally, if not all of them, from the lower counties, where nothing less than "ounce diggings" was considered pay. Much ground of this character was found; but, as is universally the case in gold found in the alluvium, it was in spots; upon the slightest decrease of the yield, the ground was abandoned as worthless.

Miners arriving at subsequent periods were informed that the pay ground was worked out, water was too scarce—in fact, nothing was to be made. As the natural consequence, placer mining was almost entirely abandoned. A number of the pioneer miners, now residing in this valley, will tell you the same story when asked in regard to the placers.

The business men of Susanville will tell you the same thing, or at least speak discouragingly of it. In regard to the quartz interests there have been what may be properly termed two excitements, which resulted as the majority of them do—in nothing.

Inexperienced parties generally constituted them, and their only desire was to find some rich surface showing as a basis for speculation, without the slightest intention of developing property for any real merit it might possess, or working it for a future profit. With one or two exceptions nothing was found to suit their purposes, and, as in the case of the placers, it was also allowed to decay. Many of our readers will recognize the truth of these statements.

In conclusion, we assert the fact that we have mines equal to any in the State, if properly developed; in evidence of which the following facts are submitted: Lying along the north base of the range, separating us from Indian valley, a continuous stratum of alluvium is found, carrying gold in paying quantities; the greater portion of which can be worked to a fair profit, by a more systematic and economical method than heretofore employed.

Individual owners of ground, by associating their labor in building ditches, can utilize many acres, which at present are of no practical value. Gold is also found in the basins and foothill system of the south side of the range, where numbers of men could find highly remunerative employment for four or five months of the year. Reservoirs for storing water can be constructed at trifling outlay of labor, and, if properly managed, a water supply for six months can be guaranteed.

The character of gold found on the north side shows conclusively its quartz origin, while the veins crop out as evidence of its source. It does not follow, however, the parts cropping out above the surface carried the gold; on the contrary, it was the softer portion of the veins, which, by the action of nature, have been decayed and worn down, thus liberating its precious metal. The remaining portions of these veins ought to be sought for; they may be covered to a greater or less depth with the detached matter from the country rock; but the hard croppings seem to indicate the direction in which to prospect. A careful examination of the hardest vein matter has rarely failed to show the existence of gold.

Time and energy on the part of the prospectors is all that is required to unearth many valuable mining properties; labor, intelligently directed, will insure success to many, as they have the indisputable evidence before them to justify its expenditure. These statements apply with equal truth to several of the adjacent sub-ranges.

In this connection the Union lode may be mentioned—situated on the north base of Diamond mountain. It has evidently been a prolific source of the alluvial gold found below it in the gulches.

Appearances indicate it to have been mismanaged from the date of its discovery, judging from the amount of waste work done by parties in search of rich pay streaks.

This truly magnificent property, under competent management, bids fair to be second to none in the State in point of productiveness.

Other mines might be specified which are now lying idle for want of active men to handle them. The development of this paramount mining interest is a subject well worthy of the earnest consideration of the people of Lassen county—encourage it—give a hearty support to those willing to engage in it, and your prosperity will be insured.—*Lassen County Farmer*.

**PROF. HAYDEN'S OPINION OF THE YOSEMITE.**—Prof. Hayden, of the U. S. Geological Survey, made account of his visit to the Pacific coast in company with Sir Joseph Hooker and Dr. Asa Gray, to take a trip to the Yosemite valley and bend his sharp powers of observation to a theory of its formation. The Yosemite was the first wonderland of the nation's domain set apart as a public resort and protected from the padlock and fence of the private improver and parchment farmer. In 1871-72 the Professor's expedition to Montana and his exploration of the Yellowstone region led to such interest in the geysers and to other natural phenomena of that strange territory, that Congress followed the precedent of the Yosemite and consecrated 3,571 square miles of the Yellowstone as a national park. Prof. Hayden had therefore some pride in halting by the way for an examination of the precedent. He was profoundly impressed with the scenery, and, although time did not permit of a thorough sifting of the origin of the valley, he inclined to the opinion that the supposition of a cataclysm, such as the sudden sinking of the valley, leaving its present enclosing walls frantically separate, is incorrect; but rather the formation of the valley is the result of erosion, slowly accomplished during a long lapse of years by water and perhaps by ice. This gradual process of grinding the material of the rocks into fine particles and the transportation of the debris by streams, such as the mining streams of to-day, only requires the allowance of time to account for the valley; and time in other regions has permitted formations quite as wonderful to be eroded. For instance, it seems clear to him that the channel of the Colorado has been slowly eaten away for a distance of 200 miles, over one mile in depth, and in some places over a mile in breadth.

**THE PREVENTION OF CORROSION.**—Prof. Barff lately read a paper "On the Formation of the Black Oxide of Iron on Iron Surfaces for the Prevention of Corrosion," before the British Association. The paper was very brief, but highly instructive, and was illustrated by various specimens of cast and other iron which had been experimented upon. At the commencement the Professor remarked that the decomposition of steel and iron by sufficiently high temperature had long been known to chemists, so that he could not lay claim to the discovery of it, although it had been attributed to him by some. The paper then proceeded to detail the experiments which the Professor had made for the prevention of corrosion by a steam superheater. One important result of the experiment was that different temperatures were found to have different effects upon the appearance of castings, a higher temperature producing a brighter surface. In conclusion, the Professor stated that he had several important experiments now in hand, but as yet he was unable to publish the results. The President of the section, Dr. Ahel, read a note upon the same subject from Mr. Bower, which affirmed that, from the writer's experiments, he found that direct oxidation of the air produced in cast iron a coating which is equal to superheated steam. A brief discussion followed, in the course of which the President referred to the present method of protecting or coating gun barrels, and to the important results which Prof. Barff's experiments would probably ultimately have upon such methods.

In Ohio there are 56 railroads, exclusive of the narrow-gauge roads, eight of which did not pay their running expenses during the year 1876. Thirteen paid no interest on their bonded indebtedness. Seven are in the hands of receivers. The gross receipts of these roads for 1876 amounted to \$34,119,049, while the operating expenses were \$24,404,565, leaving \$9,714,484. The total cost of these roads, including all debts, was \$317,222,232, showing that the net earnings are a trifle over three per cent. of the invested capital. The total bonded indebtedness is \$160,000,000, all of which bears six per cent. interest or more, so that the net earnings will not be sufficient to pay the interest on the bonded debt, and leaving nothing for the millions invested by stockholders, of which there are 17,000. If, asks the *New York Shipping List*, this is the result of railroad investments in Ohio, the leading State in agricultural products, with growing manufacturing enterprises, and coal and iron in abundance, what must be the condition of railroad property in less populous and less favored States?

ONE of the latest Yankee ideas is a Turkish bath on wheels. It is a car that can run behind the sleeping coaches of an express train. It has a drawingroom, a Russian and plunge bath, shampooing rooms, and all the other accommodations of a Turkish bath house. The temperature of the rooms varies from 80° to 160°, and the compartments are lighted from the roof with blue glass. Travelers can bathe as well as eat, drink, and sleep on the rail. Such a car can be switched off on a side track in any town or village, and remain a day or two for the accommodation of the residents.

## Ventura Sulphur Beds.

The *Ventura Free Press* says: We are obliged to Mr. Martin for information as to the use of the raw sulphur which exists in such quantities in the mountains north of us:

The sulphuric acid, which forms the leading ingredient in cleaning and purifying the petroleum oils, can be manufactured from the sulphur found on these mountains, and made so cheaply that it will not cost over \$40 per ton. In Michigan they have been making acid from the refuse of sulphate of iron picked from the coal, which was bought in Danville, Ill., at \$2 per ton, and freight for 150 miles paid thereon, when it was made into acid and shipped to Cleveland and sold for two and one-half cents per pound. The present price of sulphuric acid is five cents per pound, and there is little doubt that if our oil interests are increased, a manufacture of this kind will be one of the most profitable institutions connected with our industries. The mode or process seems to be somewhat intricate. The sulphur is burned in kilns, and the gas proceeding from it is called sulphuric acid gas. The niter is mixed with a certain quantity of sulphuric acid in an iron pot and boiled. The gas from this is called hypo-nitric acid gas. These gases mix or pass together to a condensing chamber. The process of gases in the chambers are hypo-nitric acid and sulphurous gas, which, when mixed, through the agency of moisture, falls through traps to the bottom of the chamber; and after a repetition of this with some other intricate treatment, passes through a draft pipe and becomes the desired article. The sulphur is so abundant here that it would compare favorably with the cost of manufacturing oils in the East, the sulphuric acid being used in large quantities; and while manufacturing this article, muriatic, nitric and acetic acids would also be made, for which a ready market always exists.

**THE PERUVIAN NITER-BEDS.**—On the Pacific coast of South America, extending from the fourth to the fortieth degree of south latitude, about 2,400 miles along the slope of the Andes to the sea, in Bolivia, Peru, and part of Chile, there has been found a line of deposits of sodium nitrate, the "Peruvian niter." The beds are of variable thickness, covered by from one to 10 yards' depth of earth and half-formed sandstone. The dry soil of the most of this rainless country is pervaded, in some degree, with this deposit. The mummied remains of the old Peruvian people are embalmed with it by the earth in which they are buried; and its crystals glisten on those ghastly relics which were presented in the Peruvian department of the Centennial exhibition, and those brought to this country by Dr. Steere. It is estimated that in the Province of Tarapaca, within 50 square leagues, the quantity of the niter is not less than 63,000,000 tons. The appropriation of this vast resource has been taken up rather slowly, but has much increased for 10 or 12 years past. Vessels laden with it go to the coasts of manufacturing countries. At Glasgow, the works devoted to the production of ordinary saltpeter from the niter of Peru extend over acres of ground. In 1868, 100,000,000 pounds were used in Great Britain. As yet it has been applied to the nourishment of crops only to a limited extent. But this seems to be its chief destination, and for this use it lies in the earth, a vast mine of wealth, for the disposal of coming generations. When multiplied population puts the sustaining power of the earth really to the test, this fund of sustenance on the Peruvian coast must come to outweigh in value the gold and silver mines of the Californian coast.—*Popular Science Monthly*.

**INSTITUTION OF NAVAL ARCHITECTS.**—This institution is a favorable instance of the rapid growth of societies with a clearly-defined object. Since it was launched, in 1860, it has increased greatly in importance, and has done excellent service in directing the attention of naval architects to the scientific side of their profession. There is ample evidence that good ships were built in the olden time by rule of thumb, as people spoke intelligently before grammar was invented; but there can be no doubt that the reduction or elevation of any kind of human effort to scientific rule is invariably a gain. Now that shipbuilding, especially as applied to warlike purposes, is passing through a period of transition, the deliberations of scientific marine architects are peculiarly valuable, inasmuch as, until a great sea-fight actually occurs, scientific theories must regulate the construction of our fleet. It was a happy idea to inaugurate a series of autumnal meetings by a visit to Glasgow, the great stronghold of the iron shipbuilding trade since that branch of industry has been driven from the Thames. The figures quoted by Lord Hampton show, indeed, a serious falling off in the building trade of the Clyde; but while 174,000 tons of shipping per annum are turned out there is no need for despondency. We must confess that we do not follow Lord Hampton in what appears to us his inordinate admiration for sailing vessels. More particularly calling for remark is his observation that "in our men-of-war he would rather see auxiliary screws than solely screws." We thought we had enough of sailing ironclads when the *Captain* went down.—*Iron*.

GERMANY entertains the idea of establishing an export and coasting trade in coal. Some 30 new pits have lately been sunk, or are undergoing the process of sinking, and it is estimated that she could readily increase her present output 50%.

## USEFUL INFORMATION.

## Obtaining Coloring Matter from Coal.

During the past few years the coal-tar colors have been in much favor, and various chemists have given great attention to their production. Dr. Mensel, of Breslau, says the *London Mining Journal*, has now invented a process according to which fossil coal, cannel, anthracite, or bog-head coal are treated advantageously in fine powder with oxidizing chemical compounds by ordinary or higher temperatures in suitable vessels. The most advantageous method of carrying out these improvements is to heat the different coals, finely powdered with nitric acid or with potassic or sodic nitrate, and sulphuric acid. Also potassic chlorate or potassic chromate, or hypochloride of lime, or compounds of manganese, may be used for the reaction, with or without an acid. By the action of nitric acid, or nitrates with acids, compounds of nitrogen with oxygen are developed, which are to be used in the manufacture of sulphuric acid or salts, containing nitrogen bound to oxygen.

Coals treated in this manner undergo a great change; a great part of the coal can now be extracted by caustic alkalies, and by ammonia, or by the carbonates of soda, or potassium, advantageously. By heating the solution of alkalies with the product of the above treatment, a deep brown-colored solution and a black residue is obtained. The black residue is a deep black covering color, which may be used for line color (glue color) or oil color, or with bone black, or instead of bone black, soot or graphite. It may also be applied for the black for printing, or for blacking, and washing, painting, besprinkling, or other like purposes. The brown solution of the alkali salts may be used directly for coloring, for instance, by fluids, by soap, or otherwise. The solutions give, by evaporating the alkali salts, and by decomposition with metallic salts, new salts of metals, which are to be used as colors.

By the method of decomposition the salts of strontian, of barium, of magnesia, of aluminium, of manganese, of iron, of cobalt, of nickel, of zinc, of cadmium, of lead, of tin, of copper, and chromic oxide are obtained. All these bodies are black, black brown or brown colors, which may be mixed with other coloring matters. They can be used for painting, printing and coloring. These colors are obtained as precipitates and can be purified by water. The alkali solution can also be decomposed by the soluble metallic salts above (cotton or wool), and may so be used by the dyer. The alkali solution can also be decomposed by acids; a black brown precipitate is obtained, which may be washed in water, and which may also be used as a coloring matter. This black precipitate is the acid in which the coals are partly converted by the treatment with oxidizing compounds. By these means fossil coal is oxidized, and the black residue obtained by the decomposition of the oxidized fossil coal may be applied as a coloring matter to various useful purposes. The product of the oxidation of fossil coals is soluble in alkalies, and the compounds of this product of oxidation may be applied as a coloring matter to various useful purposes.

**PRESERVATION OF WOOD.**—During the excavation of a canal in Berlin, the workmen struck upon 12 perfectly preserved coffins, which laid apparently in four graves, each containing three superimposed coffins. The site of the discovery corresponds with the cemetery that existed even as late as 1620 in connection with the poor-house and pestilential hospital. The corpses must in consequence have been in the earth for at least 260 years. Notwithstanding this long period, the coffins, as well as their contained bones, are in a perfect state of preservation; articles of clothing have even been found still clinging to some of the bones. Prof. Virchow found, upon investigation, that the coffins were coated on both sides with a thick layer of tar, the wood itself appearing to be young oak of three cm. thickness. A silicious crust was likewise found on the inner side of the coffins. The wood is so hard that axes and saws were broken in the attempt to cut it. The wood is held together by long wrought-iron nails which appear very different from those used at present. They are 8 cm. long, 4 mm. wide, and 2 mm. thick. They all have a groove running along their entire length, apparently to increase their surface contact. The nails are very much rusted, but are still sound in their interior.

**UTILIZATION OF IVORY DUST.**—In the manufacture of paper knives, keys for musical instruments, and other articles, large quantities of ivory dust are annually produced, and endeavors have been frequently made to utilize it by means of some agglutinative solution which would enable the mass to be molded into various forms, but hitherto all attempts have ended in failure more or less complete. Much of the clean ivory dust is boiled to obtain the gelatine, which makes excellent jelly when suitably flavored; and the refuse is sold to the manure-makers. M. Latry, however, has described to the French Society for the Encouragement of Industry a method by which ivory dust and the dust of bones can, by means of an agglutinative substance, and under the influence of a high temperature and compression, be molded into various articles, suitably colored, and of extreme hardness.

## Fire-Proof Cottages.

At a late session of the American Institute, New York, says the *Manufacturer and Builder*, there was submitted a report of the proceedings of the Forest Congress, held at Sea Grove, N. J., in September last, a prominent reference in which report was to the scheme, generally discussed at the Congress, of constructing fire-proof cottages; primarily, as a means of lessening the consumption of forest timber, but also for the general reason that such structures are, on most accounts, more desirable than homes built of wood. Papers read, addresses delivered and discussions engaged in favored such a plan of building, and the generally expressed belief was that good fire-proof cottages, schoolhouses, churches, etc., are entirely feasible, that their cost is but little more than for wood structures, that they are more durable, healthier for inmates, will reduce fire and life losses, and will naturally lessen the drain on the forests of the country. French tile and terra-cotta were especially recommended as desirable fire-proof building materials, the last-named substance being particularly enlogized on account of its perfect adaptation to attractive finish of outer and inner walls, and because of its fire-proof and ventilating qualities.

Who can tell but that the investigations and experiments suggested by the Forest Congress shall not prove the initial in a movement to work a revolution in the matter of the material used for house construction?

**AN IDEA IN REFRIGERATION.**—Housekeepers who are troubled with moisture in their refrigerators will be glad to learn how it may be prevented. Fresh, unslacked lime, in small quantities, say a quart, placed in a refrigerator, will gradually absorb all the moisture in the provision chamber. The consequence will be a dry cold atmosphere, in which meat and other articles sensitive to the presence of moisture can be kept sweet for a long time. A little experience will soon enable one to know when to renew the lime and how much to use at a time.

## GOOD HEALTH.

## Try to Stop Coughing.

A gentleman called upon us recently, says *Hall's Journal of Health*, who actually escaped from the fangs of consumption some years ago; and we are induced to present the circumstances: "You speak of coughing continually. Let me suggest to you the query whether this is not unnecessary and injurious? I have long been satisfied, from experience and observation, that much of the coughing which precedes and attends consumption is voluntary. Several years ago I boarded with a man who was in the incipient stages of consumption. I slept in a chamber over his bedroom, and was obliged to hear him cough continually and distressingly. I endured the annoyance, night after night, till it led me to reflect whether something could not be done to stop it. I watched the sound which the man made, and observed that he evidently made a voluntary effort to cough. After this I made experiments on myself, and found that I could prevent myself from coughing, sneezing, gaping, etc., in case of the strongest propensity to these acts, by a strenuous effort of the will. Then I reflected that coughing must be very irritating and injurious to the delicate organs that are concerned in it, especially when they are in a diseased state. What can be worse for ulcerated bronchia, or lungs, than the violent wrenching of a cough? It must be worse than speaking. A sore on any part of the body, if constantly kept open by violent usage, or made raw again by a contusion just when it is healing (and of course begins to itch), will grow worse, and end in death. Certainly, then, a sore on the lungs may be expected to terminate fatally if it is constantly irritated, and never suffered to heal; and this, it seems to me, is just what coughing does for it. On the strength of such considerations as these, I made hold to ask the man if he could not stop coughing. He answered no. I told him what I thought about it, as above. He agreed to make a trial; and, on doing so, he found, to his surprise, that he could suppress his cough almost entirely. The power of the will over it increased as he exercised it, and in a few days he was mostly rid of the disposition to cough. His health, at the same time, evidently improved, and when I last saw him, he was in strong hopes of getting out of death's hands."

## Early to Bed and Early to Rise.

The visit of the emperor of Brazil, and the daily chronicle of his round of work, bring forcibly to the mind the great value of early rising. We, says the *London Lancet*, have been trying to estimate the commercial gain to this metropolis which would accrue if these imperial habits were imposed upon us. If we rose with the sun, instead of the usual hour of eight o'clock, we should gain, on an average, two hours' additional daylight throughout the year; and if we sought our beds two hours earlier to compensate for our early rising, we should be saved the expense of artificial light for 730 hours in each year. Now, there are, in

round numbers, 450,000 houses in London, each of which we may suppose requires five gasburners, or their equivalents in lamps or candles, after dark. At present we may reckon that 2,250,000 gasburners are burnt for 730 needless hours in each year; and if we take the average consumption of gas at three feet per burner per hour, we may say that each burner consumes, in round numbers, 2,200 feet of superfluous gas per annum, which gives a total for the metropolis, in round numbers, of 500,000,000 cubic feet of gas, or its equivalent, which might be saved. Taking the cost of gas at 3s. 9d. per 1,000 cubic feet, we find that the saving to the metropolis of early rising might amount, in the matter of artificial light alone, to no less a sum than £900,000 per annum.

When we consider, also, that every gasburner requires to be supplied with nearly 2,000 cubic feet of air per hour, and that after dark the demand for fresh air is nearly doubled in this already stuffy city, because the wants of luminators are added to the wants of man, the gain in health would be scarcely less than the saving in money.

If, too, which is not likely, we were to make as good a use of our time as the emperor, we should perhaps verify the old saying that "Early to bed and early to rise make a man healthy, wealthy and wise." May we hope some day to see distinguished persons enjoying the pure crisp air in Hyde park at 6 a. m.? May we ever be allowed to have a daylight theater that does not reek of humanity? Shall we ever see the abolition of "evening church?" And will the House of Commons, the pioneers of sanitation (!), ever set us a good example in the matter of keeping what Mrs. Grundy speaks of as "decent hours?"

**VAMPIRE WOMEN.**—"Vampire women" is the suggestive title of an article in a recent number of the *New York Tribune*, which is devoted to "the lean, bloodless, miserable girl or wife, flabby and unable in flesh and mind, whose disease takes, in the family, the vague name of debility, or nervous exhaustion, or spinal disorder." The majority of young girls, the writer proceeds to say, are born tired. It is not affection which makes them thin of blood and morbid in brain at the age when the current of life should run fullest and reddest. They are called "vampires" not merely because their own existence is unhealthy, but because they sap the energies of those about them. A regimen of iron, exercise, change of air, etc., which may quicken the pulse in the patient's veins for the time, neither reddens her blood nor rounds her cheeks permanently. The system of cure for patients of this description adopted at the hospital for nervous diseases in Philadelphia is the only one that has thus far been found effective. Absolute rest in bed for six weeks or two months is enjoined. A milk diet is ordered, and the lack of exercise is supplied by treatment known as massage, or kneading every muscle and square inch of flesh in the body and by electricity. Reading, sewing or any other occupation is absolutely prohibited. It is said that nervous and debilitated women, who have been subjected to this treatment, have come out of the hospital at the end of the time fixed perfectly restored in mind and body, and without a trace of dyspepsia, hysterics, or anæmia.

**MILK AND LIME-WATER.**—Milk and lime-water are now frequently prescribed by physicians in cases of dyspepsia and weakness of the stomach, and in some cases it is said to prove very beneficial. Many persons who think good bread and milk a great luxury frequently hesitate to eat it for the reason that the milk will not digest readily; sourness of stomach will often follow. But experience proves that lime-water and milk are not only food and medicine at an early period of life but also at a later, when, as in the case of infants, the functions of digestion and assimilation have been seriously impaired. A stomach taxed by gluttony, irritated by improper food, inflamed by alcohol, enfeebled by disease or otherwise unfitted for its duties—as is shown by the various symptoms attendant upon indigestion, dyspepsia, diarrhea, dysentery and fever—will resume its work, and do it energetically, on an exclusive diet of bread and milk and lime-water. A gullet of milk may have four table-spoonfuls of lime-water added to it with good effect. The way to make lime-water is simply to procure a few lumps of unslacked lime, put them in a stone jar and add water until the lime is slacked and of about the consistency of thin cream; the lime settles, leaving the pure and clear lime-water at the top.

**DANGER OF OVERSTRAINS.**—The dangers of such sudden strain are not confined to failure of the heart upon the spot. Very commonly in those cases where apparently healthy old people are found dead in bed, there may be traced a history of sudden effort made during the preceding day. The overstrain so put upon the heart does not manifest itself fully at the time; but during the sleep of the ensuing night. Even in cases of fatal syncope of the heart, preceding ruptures are found at times with a clot blocking the opening. These are extreme cases truly, but they demonstrate beyond doubt that serious injury may be inflicted upon the heart without instantaneous consequences. With elderly people sudden exertion during the day is undoubtedly one cause of failure of the heart's action during the night; so that the effort may really be only apparently made with impunity.

## NEW ADVERTISEMENTS.

P. K. Dederick Patent Iron Horse Hoisting Engine, Marcus C. Hawley, S. F.; Union Iron Works, Root, Neilson & Co., Sacramento, Cal.; Stockholders' Meeting—Hackberry Mill and Mining Co.; Postponement—California Fruit Growing Association.

## The Week.

The most startling event of the week has been the Patent Office fire in Washington, when some 87,000 models were destroyed and great damage done. This was really a national calamity and its effects will long be felt. The Patent Office Department, however, some years since, adopted the wise policy of publishing full specifications and engravings, which are scattered all over the country, so that complete records could never be destroyed. There will be very little detention in the business of the Patent Department on account of the fire; but the accident will draw the attention of the country to the necessity of putting up absolutely fire-proof structures for Government records, documents and similar property. There is little of interest in mining matters to note, except some important air connections on the Comstock, which are referred to in our Mining Summary. The mines of Tuscarora district are attracting some considerable attention just now, and look exceedingly promising. We give elsewhere the premium list, as far as completed, of the Mechanics' Institute fair, which closed last Saturday, and are pleased to see the familiar names of many of our old patrons appear therein.

## Mica.

A correspondent writing from Prescott, Arizona, sends us some specimens of mica, not of a superior quality, asking us to hand the same to parties in this city dealing in the substance. He also wants to know whether it occurs in lodges or pockets; what should be the formation; what is the value in this city; how deep is the average lead; how should it be prepared for market, etc. Answers to some of these questions may be of interest to others than our correspondent.

There seems to be an impression that mica is a rare substance, and as such is very valuable. This is by no means the case, for it is neither very rare nor very valuable.

Mica is a name in mineralogy given to a group of the silicates distinguished by their remarkable lamellar structure and the elasticity of their laminae. The minerals crystallize in large rhomboidal prisms, which separate with great facility in leaves parallel with the base of the crystal. These may be subdivided until several thousand plates are required to make the thickness of an inch. There are several varieties, the most familiar form of which is muscovite, which is found both disseminated and in veins; and in many of the stratified rocks it is an incidental constituent derived from the destruction of the original formations to which it belonged. The mineral is thus seen to be very generally disseminated; but certain localities are distinguished for the production of large plates of it. In Siberia they are found more than three feet across, and have been obtained of great size in Sweden and Norway. This is also the case at Acworth, Grafton and Alstead, N. H., and elsewhere. Mica is mostly used for the doors of stoves and sides of lanterns. It has also been used as a substitute for window glass, for optical instruments, for bronzing powder, and is serviceable for holding small objects for microscopical examination.

The substance is probably mined more extensively in North Carolina than anywhere else in this country, and the mines in Mitchell county, in that State, supply nearly all that is used in the United States. A number of mica mines on this coast have been opened at different times, but we never heard of any making any money out of the substance here. Its uses are so limited that the demand is small. The principal sale would be to Eastern stove manufacturers, and the North Carolina miners can furnish a great deal more than is used. The people owning these mines have a kind of monopoly of the trade, as the article they furnish is first class in every respect and they can mine and produce it cheaper than we can here.

There are extensive deposits of this substance known to exist in several places in California and Nevada. We understand that a company is being formed here now to work some mines about 50 miles from Elko; but from what we learned, some time since, about the supply and demand, we have doubts about its pecuniary success.

Now, as to the value of marketable mica. The general impression is that it is worth from \$2 to \$14 per pound, according to size of sheets. To show how sanguine people are on such subjects, we will take a few extracts from a prospectus of a new company recently formed in Colorado, the object of which is to mine for mica (after selling shares). The prospectus states that the quarries, which are 35 miles from railroad, are capable of supplying, with a few men, one ton of clear-cut sheet mica per week, which will sell readily at an average of \$5 per pound, or \$10,000 per ton. To produce this ton of mica and prepare it for market, counting one ton per week, the expenses are estimated as follows: Salaries of superintendent, two foremen, eight skilled miners, and eight strippers and sorters, \$562 per week; packing department, \$100 per week; hoisting and freight department, \$685; and headquarters expense, \$87; total, \$1,434 per week. The ton of clear-cut mica in 10-pound boxes is produced, therefore, at a cost of \$1,434, leaving a net profit to the company of \$8,566 for every ton produced, or a grand annual profit of \$445,432, or 85% of the capital stock, in the sale of a ton of mica per week. This shows pretty good figuring, and we apprehend that even at the large cost of production estimated, if anybody could get anything like one-quarter the estimated profit here, most of our miners would quit working for gold or silver and open up a few of the mica mines which are lying around loose in different sections of the country.

To start this little mint only \$25,000 are required, to put up machinery and buildings—and two weeks' work will pay it back. The only thing queer is that they don't hold on to those shares themselves, and get out a few tons on a small scale, so as to make the mica pay for the improvements. The "mine" is described as having "an open cut 18 feet high, and one adit driven into the mountain on the quarry about 16 feet. Both have been worked at great expense, owing to the former high price of provisions and great scarcity of labor." This sounds funny to any mining man, especially about the 16-foot adit and the scarcity of labor. A sick Chinaman could dig that far in, with proper tools, in a few weeks.

We mention this incidentally to show that

the impression is abroad that mica is a very valuable and rare substance. A price such as several dollars, or even one dollar per pound, except for large pieces of first-class character, is out of the question. At Breslau, Prussia, an important industrial center, one house devotes itself exclusively to manufacturing articles from mica. This house cannot buy the American article, but now purchases elsewhere, because the price here was too high. As for merchantable mica, even of the best quality, the waste in working it at a factory is from 33% to 75%, and the wastage is not worth a dollar a hundred weight. The price paid by the house referred to is 14 cents to 75 cents per pound. In this city there are no purchasers at all, and we know of no one on the coast who deals in the article.

In preparing samples the pieces should be left in their natural shape, not trimmed or squared up, but just as it comes from the mine. Mica of good quality has the following characteristics: If the top layer, generally stained with foreign substances, be removed, the ore beneath, when split off, should be of crystal-like transparency, while the body of the piece, in all its thickness, should show a reddish hue, with a very smooth surface. To the touch it must feel hard; soft mica, though ever so transparent, does not serve for manufacturing purposes. Finally, the layers, when separated, should be free from flaws or air bubble. Small pieces, two to five inches square, amount to very little in a commercial view. We have seen perfectly pure, clean sheets, 10 to 16 inches, taken from a mine on this coast; and although it was first class in every respect, the mica could not be sold here at any price, there being no demand at all for it on this coast. If the new toughened glass supersedes mica, as seems likely, for it answers about the same purposes, mica would be of no value whatever, except for scientific matters, so that it would not pay to mine it at all.

## Telephones in Mines.

We notice that a telephone has been successfully introduced in England for communication between the workings of a Cornwall mine and the surface, thus superceding the old-fashioned cord signals. It is probable that before long this latest achievement of science will find recognition in all large mines, and that telephones will be as common as bells and cords are now.

A great advantage of this new means of communication is that a valuable saving of time will be gained and work rendered much more convenient. It will not be necessary to send some one up to communicate any orders or requests out of the ordinary line; and those on the surface may issue directions at any time without going or sending down the mine. In case of apprehended danger, no time need be lost in communicating from either direction such instructions as are necessary.

As far as we have heard, no attempt has been made to place the telephone in any of our large mines on this coast, but it always takes a little time to introduce any new thing of this kind. There may be some apprehended difficulties or inconveniences in the practical use of telephones in mines, but if one superintendent will demonstrate among us that it is a useful appliance, all the others will shortly follow.

MR. HENRY SEWELL, M. E., who has been in Chile for the past two years, has returned to this coast via London, to take charge of the interests of certain English mining companies here. Mr. Sewell, who was formerly an occasional correspondent of the Press, has been an advocate of American mining interests in England, and will be remembered as having written a pamphlet on the Emma mine and its management. He advocated in England the purchase of the Flagstaff mine at \$60,000, which was afterwards bought at \$1,500,000; the Yosemite mine, at Utah, for \$75,000, which afterwards mined out \$300,000; and the "No You Don't" or Telegraph mine for \$20,000, which has produced some \$500,000. Probably had the mines been bought at the bedrock prices stated, the English would have realized more than they have. Mr. Sewell's familiarity with matters on this coast will be of advantage to him and to his companies, and it is to be hoped he will be able to bring them out of financial difficulty. Mr. Sewell has brought with him from Chile a very fine and interesting collection of silver ores from the limestone formations in Chile, Peru and Bolivia, such as have never been seen here before. They are now on exhibition at Riotte & Fernbach's, 303 Montgomery street, where they will be for a short time. He has also brought some samples from the gold diggings at Catapilco. Mr. Sewell promises us some notes on railroad and mining matters in Chile.

**SIERRA COUNTY MINES.**—The Pliocene company, at Galloway Hill, are now down near 250 feet, with their boring machine in swelling bedrock, and are so much encouraged with the favorable indications of the existence of a rich gravel channel that they have decided to sink a shaft immediately. A 900-horse-power engine has been ordered from San Francisco, and a contract let for 500 cords of wood. The swelling bedrock is so difficult to run through that further progress with the boring machine will necessarily be slow until this impediment is removed.

## The Hayden Survey.

We had the pleasure, this week, of a conversation with Mr. A. D. Wilson, of Prof. Hayden's United States Geological Survey, who has just come in from the field. He has made a short visit in Oakland before going on to Washington to prepare his report. Mr. Wilson was formerly connected with the California State Geological Survey, and was also one of the party with Clarence King when the "Arizona diamond" exposure was made. He had been all over that part of the country where the diamonds were supposed to have been found, and went with Mr. King to the spot at the time of the exposure of the fraud. Mr. Wilson now has charge of the triangulation and topographical work of the Hayden Survey.

There have been four regular parties in the field this year. The scene of operations has been in the Wind river country, and then to Fort Hall, and from Rawlins to Ogden, and as far north as the National Park, Wyoming. About as little is known of this as any part of the country. No parties who have done any work have been through there since Fremont's, in 1842. Mr. Wilson's duties are to go ahead, lay out the bare points, etc., and the other parties come on afterwards and work up the details. The other three parties were under Mr. Becker, Mr. Gannett and Mr. Chittenden, all of whom have finished the season's work in the field, and are now on their way to Washington. They have been out about four months, and have accomplished considerable work during that time. There has been a geologist with each party, so that the topographical and geological work has been done at the same time.

In the Wind river country they saw some fine looking outcroppings; but no prospecting at all has been done in that section, as the presence of Indians prevented any mining work being done. The report on this section will embrace a general description of the country, with economic maps giving the location of grass, timber and agricultural lands. The survey next year will probably be continued in Wyoming until a complete survey of that Territory is made, the same as has been done in Colorado. This winter the maps of Colorado will be finished up. These will be in the form of an atlas, and will be on the scale of four miles to an inch. The maps show two degrees east and west, and a degree and a quarter north and south. There will be geological as well as topographical maps, probably the best ever made in the United States. The maps will be all colored, those on the geology in accordance with the geological formation. The newest State in the Union—Colorado—strange to say, is the best surveyed one of all, as, when these maps are finished, all the geological and topographical details will be shown in a manner far ahead of the surveys of any of the older States.

The Hayden survey has been performing very good work ever since it was started. Its distinguished chief is personally popular, as are the assistants, and he has succeeded in making the survey itself popular, so that there has been no difficulty in securing appropriations from Congress from year to year. The work accomplished is highly important, as giving information of sections of the United States almost entirely unknown. The general public seem to appreciate the efforts made in this direction, and there is little probability of the survey being discontinued. The reports are fresh, and written in a comprehensive manner, reflecting great credit on all concerned. While all matters of a scientific character are ably discussed and accurately described, the general matter is of a nature to be comprehended by all, and there is no pedantic attempt to confuse those for whom its reports are really intended—the people.

**THE FAIR DAILY.**—We are pleased to know that the *Mechanics' Fair Daily*, which was published by Dewey & Co. during the fair of the Mechanics' Institute, succeeded in winning many good opinions from the many patrons of the fair. On the part of the publishers we are glad to acknowledge that no small part of the popularity of the fair organ is due to the devoted labors of Mr. A. O. Carpenter, of Ukiah, Mendocino county, who managed the editorial department. Mr. Carpenter is a writer of ability, and is possessed of a dash of humor which gives spice and life to all his productions. At home he is a power in the life and in the business interests of his county; and we are pleased to assure his friends that he won new laurels during his latest sojourn in the city.

**PRISMALOID RAILROAD.**—Notwithstanding considerable opposition made to the proposed prismaloid railroad, the Board of Supervisors has given permission to have the road built. The order starts the road from Market and Valencia streets, "along and over such streets that are or may be opened and established for street purposes, up to the entrance of Golden Gate park; thence to the park and along the beach to the boundary line; thence back to the intersection of San Jose avenue and 26th street, over such streets as may be opened." The secrecy in reference to the route was based upon the statement that if it was known the people owning the lots would raise the price of their lots on the company.

We are indebted to Mr. E. K. Downer, of the *Mountain Messenger*, for some fresh mining items from the prolific hills of Sierra county. Mr. Downer has been in town visiting the fair,

### The Patent Office Fire.

A most disastrous conflagration occurred at Washington on Monday, by which many of the models and records of the United States Patent Office were destroyed and the Patent Office building very badly damaged. The fire broke out in the attic over the model room of the Patent Office, where a large number of rejected models were stored, and soon spread to the main hall, in which are ranged, in glass cases, thousands of accepted models upon which patents have been issued.

The flames soon licked through the attic and penetrated the main hall, which was filled with an abundance of combustible stuff. Row after row of glass cases with wooden frames, many of them filled with highly inflammable articles, were stored in this hall, on the floor and on the galleries which skirted the walls on either side. These soon caught and were speedily wrapped in flames, which greedily licked up the evidences of ingenuity so profusely exhibited here, while they at the same time devoured the roof, which, in a few minutes after the discovery of the fire, was in a blaze. All the engines in the District were promptly on the spot and were at once put into active operation. It was soon discovered, however, that the fire department of Washington would prove inadequate, even with the assistance of the engines from the Navy Yard and Arsenal to suppress the flames. Dispatches were accordingly sent about noon to Baltimore for aid, and, in less than an hour from their transmission, several engines from the monumental city were in service. The distance between Washington and Baltimore is 39 miles, and the special train which drew the engines traveled the entire distance at the average rate of a mile a minute. The firemen worked with a will, and labored industriously to save what property they could by moving it. A large force of marines from the Navy Yard and the marine barracks were on hand and formed a cordon around the building, and assisted the police in keeping back the immense crowd surrounding the building. Secretary Schurz, assisted by Mr. Bell, the Assistant Secretary, superintended the removal of the files and records, which was conducted by the clerical force under their direction.

The Patent Office occupies the two blocks of land situated between Seventh and Ninth and F and G streets, and is 453 feet long and 331 feet wide, and 75 feet high. In it are the offices of the Secretary of the Interior, the Commissioner of Indian Affairs, the Commissioner of the General Land Office and the Commissioner of Patents. The original building was built of freestone and granite in the Doric style. Two wings of marble were added later, each of which equaled the dimensions of the main edifice. The principal entrance is on F street, directly opposite the General Postoffice, and presents a very commanding appearance. The building was considered the best specimen of this style in the country, as will be shown by the engraving shown on this page. The two lower stories and basement were used for the various offices of the different bureaus of the Interior Department enumerated above, and the large hall overhead was used for storing the models upon which patents were issued. This immense apartment, which extended around the vast building, had at least 75,000 models arranged for convenient reference, all classified and numbered and placed in cases. Nearly all of these have been destroyed, and many were badly damaged in being removed to places of safety. Efforts were made during the early stages of fire to save many valuable relics which were exhibited in the main hall of the model room.

The principal loss falls upon the Patent Office. The original copy of the Declaration of Independence and relics of General Washington were saved, as was also the Franklin printing press. Nearly all the specifications and original drawings of the Patent Office are safe, and from these models can be reproduced if necessary. None of the Land Office records have been destroyed by fire, but many were seriously damaged by water. The records of the application division of the office, which first receive applications from patentees, and of which papers no copies were made, were saved. The most valuable models saved were those relating to sewing machines, fire-arms, printing presses, locks, safes, etc. The models of reapers, mowers and various agricultural implements were destroyed. A temporary room will be erected at once. The damage to the building is variously estimated at \$300,000 to \$500,000, while that growing out of the destruction of models and other valuables belonging to the Patent Office is almost incalculable. The arches, which formed the ceiling of the second story, and upon which the floor of the third story rested, are so badly damaged by heat and water that many of them must be torn down. The marble of the outer walls is considerably discolored by the flames and cracked in many places. It is supposed the fire had been smoldering beneath the roof,

which was not fire-proof, for some hours before it was discovered. The total number of models destroyed is not accurately known. Many valuable documents are damaged by water, and considerable confusion will ensue from the mixing up of papers in the effort to save them from destruction. The value of property destroyed will aggregate about \$1,500,000; but as a large mass of models cannot and will not be replaced, the actual loss will probably not reach over \$800,000 or \$900,000. The Patent Office has to its credit with the Treasury, over and above its earnings, a sum sufficient to meet this expenditure, but it cannot be used without an appropriation by Congress. The cause of the fire is attributed to spontaneous combustion among a lot of non-patented chemical matters stored in the attic of the Ninth street front.

The casualty entails an irreparable loss to inventors, who are assisted by examining the models, grouped in classes, forming a bird's-eye view of the extent of inventions in a certain line, which can be minutely studied by those who have the time and interest to do so. The loss is something more than can be calculated in money, as the work of the brain and hand of every inventor forms a footprint, as it were, showing the progress of invention in America.

And yet drawings, probably of nearly every model, are intact in the Patent Office, and are more frequently used than the models by the examiners and other officers of the department in examining new applications. None of the European or older countries of the world now require models of invention, relying entirely on drawings. Therefore we are not so badly off now for models of inventions as other countries, even with so large a loss as the fire entailed. It is an extra precaution, rather, of the United States to require models, and prevents the probability of drawings being changed after apply-

PATENT OFFICE AT WASHINGTON, D. C., PARTIALLY DESTROYED BY FIRE.

ing for a patent, whereby the claims of patent owners could be afterwards extended, as the drawings are not allowed to show more than the models, of which they are a true representation. The full specifications and drawings of all patents issued from 1870 to the present time have now been printed and issued in volumes, which are scattered over the country everywhere, preserving them beyond the possibility of a doubt from loss by fire. The loss of the rejected models will not prove so serious to the Patent Office business and convenience of inventors as was supposed. The Supreme Court of the District of Columbia decided, about a year ago, that rejected cases could not be given as references; therefore, these models were mere rubbish as far as the business of the Patent Office is concerned, and are little loss to the country. In fact, the Patent Office officials had been looking around for some time to see what disposition could be made of these rejected models, so as to give room for those which were useful. Their loss will perhaps be of benefit to the inventors, because these models being out of the way, the examiners will not be likely to be prejudiced by what they had seen in old, rejected cases in their examination of new applications. With "live" models it is, of course, different, for here the loss is irreparable. The business of the Patent Office will probably go forward with but little detention in most cases, so that inventors need not hesitate about applying for patents on account of the fire. Pacific coast inventors will have their interests looked closely to as our agents in Washington will exercise extra precautions in pushing ahead applications at the present time. Since removing to our new offices at 202 Sansome street, our facilities for transacting patent business are improved, and the fire in Washington need not delay at all the applications sent on.

The fire in the Patent Office in 1836 was doubtless a more serious loss, as there were very few publications of the Patent Office reports, and they had a less complete system of drawings, etc. The main description of many patents issued was lost entirely to the Government. The attempt to get parties holding patents to return them to the Government officials for copying was a failure, as comparatively few complied with the request.

THE Mayor of Fernandina, Florida, asks contributions in money and supplies for the relief of sufferers from yellow fever.

### Alpine County and its Mines.

[Written for the Press.]

#### A Mountainous Country Aply Named.

While Alpine county belongs politically to California, its position and topography make it a part of the great Utah basin, and, in this sense, attach it to the State of Nevada. In view of this fact, the people of Nevada, while it was still under a Territorial form of government, made strenuous but unsuccessful efforts to induce California to relinquish this strip of country to them. The county has been aptly named, being wholly Alpine in its position and external aspects. While its westerly half occupies the summit and slope of the Sierra Nevada, here precipitous and lofty, its easterly is covered by an outlying spur of that range called Silver mountain, the two being connected by a serrated ridge stretching east and west across the southerly border of the county. These several elevations, with some rugged hills and many deep canyons, make up almost the whole area of the county, very little of which lies at a lower level than 5,000 feet, while portions reach an altitude of more than 13,000. Approached from the north, and seen as far off as Virginia City, nearly 100 miles away, this cross range presents a perfectly castellated outline, very picturesque and striking, while Silver mountain lifts itself to a height of 11,000 feet on the one hand and the Sierra to a much greater height on the other; both being

nounced, some would be found adequate to their successful treatment. While the most of the money required for prosecuting these enterprises came from the Atlantic States and Europe, the people of California and Nevada contributed largely toward the earlier improvements made in this region. Of the primitive stock of miners many toiled for several years and then left without receiving anything for their labor or money expended. So, too, the capital advanced by Californians for constructing the first roads, building towns and furnishing merchandise and other supplies, was about all lost. Still, there is no doubt but these Eastern investors have, first and last, sunk more money over in Alpine than has been lost by our own people.

#### In Regard to These Foreign Companies,

The following synopsis of their operations and affairs will convey some idea of the amount of money they have expended in these Alpine county mines and how they are likely to come out in the end; only the leading companies, or such as had out considerable sums, being included in this enumeration:

The Schneetady, a New York company, incorporated in that State in 1871, expended for a 20-stamp mill, erected that year, \$80,000, and, in the purchase and development of their mine, the Tarshish, an additional sum of about \$100,000—say, altogether, \$200,000. This property is situated near the town of Monitor, the location being one of the earliest made in that district. Two tunnels have been driven to the lode, the upper intersecting it at a length of 450 feet and the lower at a length of 900 feet, the two being connected by an incline 225 feet deep. From this incline various drifts have been carried both north and south, cutting numerous small clayey pockets carrying black sulphides of fair quality. From one of these drifts ore of this kind, to the value of \$10,000, has been extracted. From the upper works some 2,000 tons of \$30 ore have been taken, the most of which remains at the mine. For roasting their ores, the company put up one of White's revolving furnaces. After a trial upon 300 tons its further use was dispensed with, the chlorination not exceeding 47% of the assay value of the ore. Having tried wet and dry crushing and failing with both, as well as in their attempt to desulphurize and chloridize their ores, the company shut down their works in 1873, and have done but little since. The property is in good condition and pretty well explored, and could, no doubt, be operated with profit, could means be supplied for cheaply and thoroughly beneficiating the ores.

#### The Exchequer Mine

Is situated on Scandinavian canyon, Silver Mountain district, at an elevation of 1,300 feet above the adjacent valley. It is the property of an English company, who purchased it some six or eight years ago, and have since expended a good deal of money upon it. Their head-quarters are in London, and the company is said to have a paid-up capital of \$500,000. If this is the case their expenditures must have been much larger than is generally supposed, or else the price paid for their mine must have been out of all proportion to its value, inasmuch as the *Exchequer* here seems to be in a rather impecunious condition, while the *exchequer* at home, judging from remarks made at a late meeting of the shareholders, is by no means plethoric of funds. The company own 6,800 linear feet on three parallel lodes, of which the Buckeye is the principal. On this a thousand feet of tunneling, with as much drifting, or perhaps more, has been run. The mine is also opened by a vertical shaft, some 500 feet deep, over which are placed steam hoisting works, with capacity to do the requisite lifting and pumping to the depth of 1,000 feet or more. On Silver creek, one and a half miles from the mine, they have a first-class, 18-stamp steam mill, with an O'Hara furnace attached, having a capacity to roast 30 tons daily. Adjoining these works is a water-driven sawmill, at which the company make their own lumber, and much, also, for sale—a 760-acre tract of woodland near their mine affording ample supplies of timber. From their mine a good wagon road has been built down the mountain, over which fuel, timber and ore are brought down, and supplies taken up.

The most of the work done and the improvements made appear to have been executed in a careful and substantial manner, but with how much economy I am unable to say, though it is probable that there have been expended upon the entire property at least \$200,000. In the principal vein opened several small ore bodies have been encountered, and a considerable quantity of ore brought to the surface. But it seems to have been impossible to work it with any degree of closeness, notwithstanding the Superintendent reports the O'Hara furnace as answering a good purpose. But the fact appears to be that Manager Chalmers had, in some unaccountable way, greatly overestimated the value of the ores taken out; and which he had led the company at home to believe would average some \$60 or \$80 per ton, whereas numerous assays made by Prof. Price, who not long since visited and examined the mine, establish that they will not average over \$5 or \$6. Three hundred tons of selected ore were found by him to yield

(Continued on page 204.)

covered with snow for seven months in the year, some of which is retained on their northerly slopes all summer.

So upheaved and eroded, the observant prospector marked this as a

#### Fit Region for Mines

At an early day; these hardy adventurers having entered the deep canyons and scaled the steep hills of Alpine in search of silver-bearing lodes in the spring of 1861. And they were not disappointed in finding here abundant indications of the precious metals. Running across the country in a generally north and south direction, there can be traced a metalliferous belt, composed mainly of hornblende, or syenitic porphyry. This belt, which is some three miles wide, carries a great number of quartz ledges, the most of them running with its course and varying from one to twenty feet in width. Some of these lodes show an enormous outcrop, with other indications of strength, many of them being also well defined and of great surface continuity. As a general thing, such of them as have been much opened seem to go down between well-formed walls, smooth and tolerably regular. These good features, with a fair showing of low and occasionally pretty rich ore in the croppings and upper workings, lead to the belief that in due time profitable mines would here be opened.

But Things Failed to Turn Out as the Miners Hoped for.

In some instances the streaks of ore found on top failed to hold downward, and when they did there was not that improvement in grade or bulk that had been expected. And when deposits, otherwise satisfactory, were opened up, the ores proved intractable to the Washoe process, which was first introduced, nor would they yield readily to other and more costly methods when these were substituted for the first adopted. These troubles began at an early period in the history of these mines, causing many of the original locators and claim-holders to abandon their interests and leave the district. Before these difficulties had developed themselves strongly, however, many companies had been formed and much capital invested in the purchase and opening up of the mines, the erection of mills, etc., these investments having been made under the impression that the ores would become more docile and otherwise improve at greater depths. It was also supposed that, of the many processes then being an-

## Custom Mills.

Mr. C. Berger, the Superintendent of the San Francisco copper mining company, at Spenceville, thinks that one great drawback to the development of mines in this country results from the fact that mine owners all want to reduce their own ores. As soon as the prospector finds a ledge that will pay, he at once makes arrangements for the erection of a quartz mill. From want of experience, or knowledge of working ores, he wastes about half the gold in the rock; and the result generally is that his mine fails to pay, and he at last reluctantly is compelled to shut it down. That this is the experience of a large proportion of miners there is no doubt. Mr. Berger thinks the reduction of ores in one district ought to be done by one or two companies; that the miner should attend only to mining, and be able to sell his ores to reduction companies at prices better than he can obtain by the present modes of working. He thinks that reduction companies with ample capital could adopt all the best improved methods of working ores, and by employing none but the most experienced workmen they could save a much larger percentage of gold than is now done and thereby be able to pay the miner more than he at present receives; besides, it would save miners the expense of erecting mills and blindly experimenting with them. We are inclined to believe the idea is a correct one. A man may be a good miner and not know anything about reducing ores. It does not follow that the owner of a mine should reduce his own rock more than that a farmer who raises wheat should erect a grist mill to make it up into flour. If a large reduction company should be organized in this district, and could purchase all the ores of the district at the mines at a fair valuation, it would be the means of opening dozens of ledges now unworked because the owners are unable to erect machinery. Such a company could erect mills wherever needed, and by employing scientific men and using the latest improvements, could save much of the gold that now goes to waste and does no one good. The idea looks feasible to us. The owner of sheep clips his wool and it is taken to the woolen mill to be made into cloth. The producer of wheat takes his crop to the custom mill to be made into flour. The cotton producer sends his bales to the mill for manufacture, and why should not the miner send his ore to the mill to be worked? Rock would then go through the hands of men who make a specialty of reducing. It could be scientifically tested before being worked. By such means improvements would soon be made that would save to the world a great waste now going on wherever mining is prosecuted.—*Nev. Gazette.*

**THE ACTION OF OILS ON COPPER.**—In a paper before the British Association, "On the Action of Various Fatty Oils upon Copper," Wm. H. Watson, F. C. S., gave in detail a number of experiments, showing the extent of which 10 different oils act upon copper. The result of the experiments seemed to show that paraffine and castor have the least action upon copper, and that the action of sperm oil and seal oil is slight. Linseed, almond, olive, sesame, neatfoot and colza produced considerable action upon copper, linseed oil being most active. The author concluded, from his experiments, that the comparative action of different oils cannot be correctly decided in all cases simply from the appearance of the oils after exposure to copper plates, though minute quantities of the metal might be easily detected in most oils from the color which is produced by such exposure. An associate expressed gratification at the results of Mr. Watson's experiments, as they confirmed the results of his own. He felt that he should be quite competent, with the aid of what he had now learned, to do that which he had long been attempting—to bring to a higher state of perfection oils for the purpose of lubrication.

**ENGLISH ROADS.**—The English, at all events, says a letter-writer, know how to make roads. Their wood pavements are magnificent. London has set the fashion of wood, and Liverpool is beginning to follow it; but there are no pavements in the States to touch these wooden roads of England. They are laid on foundations which in some cases have been solidifying since the days of the Romans. On these foundations they lay macadam and cement several feet deep, and then come blocks of pine, laid with mosaic-like accuracy. There is a piece of wood pavement of this kind in Oxford street, London, which has not been repaired for over two years, and it looks as substantial and perfect as when it was first laid down. The average price of this kind of pavement is about \$4 per square yard, and the companies keep it in order for two years without charge, and then guarantee it for 15 years at an annual charge of 25 cents per square yard for maintenance, which enables the pavers to relay the road, if necessary, after eight or ten years.

**RECLAMATION OF THE ZUYDER ZEE.**—Active preparations are going on for the commencement of the long-projected work of draining the Zuyder Zee. A dam nearly 25 miles long is to be carried across the gulf, and upon this pumping machines of 10,000 horse-power are to be placed, capable of discharging 6,500,000 cubic meters of water daily from the inclosed sea. It is estimated that the work will occupy 16 years, and that it will cost 335,000,000 francs. The scheme, if completed, will form one of the greatest engineering feats of the world.—*Engineering News.*

[Established 1860.]

## The Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS, SCIENTIFIC AND INDUSTRIAL MEN.

Is now in its THIRTY-FIFTH Volume. It has ever been, and will continue to be, the aim and object of the publishers to make the Press

## A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of our editors and correspondents, to seize upon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and to place the same before our readers at the earliest day. It has been well said that

## A Newspaper is a Window

Through which men look upon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

## In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop, and can know but little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress hooks are necessarily slow and behind the times. It is only through papers devoted to the specialty which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a laggard in the race.

## The Value to the Community

Of such publications in disseminating important information, in checking useless and exploded experiments, and in instigating important enterprises, can scarcely be overrated. Through them the readings and observations of thousands are collected and collated, and brought directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of just the information he needs—an unbound book forever issuing but never finished.

## Nowhere in the Wide World

Is such an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

## The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here, also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world.

## Useful, Practical and Directly from the Field

Of labor. The mustiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

## Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of such help our editors will be able, during the coming months, to do more than ever in furnishing information which shall be

## Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

## Our Illustration Department

Will still always form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

## Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

## The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this have no need to be anything more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million," and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

**FRED'K OGDEN, Sole Owner Tulloch Patent,**

ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, Septem-  
ber 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly  
say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery;  
there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy  
machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a ma-  
chine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Stripe Mill; they were  
thrown out after a fair trial of some two weeks.

**San Francisco Pioneer Screen Works,**

J. W. QUICK, MANUFACTURER.

Several first premiums received  
for Quartz Mill Screens, and Per-  
forated Sheet Metals of every  
description. I would call special  
attention to my SLOT CUT and  
SLOT PUNCHED SCREENS,  
which are attracting much at-  
tention and giving universal  
satisfaction. This is the only  
establishment on the coast de-  
voted exclusively to the manu-  
facture of Screens. Mill owners using Battery Screens exten-  
sively can contract for large supplies at favorable rates.  
Orders solicited and promptly attended to.

32 Fremont Street, San Francisco

**San Francisco Cordage Company.**  
Established 1856.

We have just added a large amount of new machinery of  
the latest and most improved kind, and are again prepared  
to fill orders for Rope of any special lengths and sizes. Con-  
stantly on hand a large stock of Manila Rope, all sizes;  
Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

**TUBBS & CO.,**

611 and 613 Front Street, San Francisco

**Diamond Drill Co.**

The undersigned, owners of LESCHOT'S PATENT  
for DIAMOND POINTED DRILLS, now brought to the  
highest state of perfection, are prepared to fill orders  
for the IMPROVED PROSPECTING AND TUNNELING  
DRILLS, with or without power, at short notice, and  
at reduced prices. Abundant testimony furnished of  
the great economy and successful working of numerous  
machines in operation in the quartz and gravel mines  
on this coast. Circulars forwarded, and full infor-  
mation given upon application.

50 FINE CARDS, Damask, Repp, Etc., with name on  
10 cents. CLINTON BROS., Clintonville, Conn.

Continued from Page 201.

only at the rate of \$7 per ton, and 800 tons collected at the mill only at the rate of \$5.50 per ton. Prof. Price also gave it as his opinion that if any permanent bodies of fair grade ore were ever found in this mine they would be reached only by very deep exploration. These facts, when they came to be known, created no little consternation among the shareholders in London, who had been led to believe, during a period of several years, that they were all the while on the eve of a great success. Some of the shareholders, in their severe disappointment, have sought to criticize Prof. Price and his report, although the majority of them have accepted his conclusions with thankfulness and approval, satisfied that he has performed the service assigned him honestly and intelligently, as everybody on this side will readily believe.

## The I. X. L.

Lying a little below the Exchequer, on a parallel lode, belongs also to an incorporated English company, having a paid-up capital of \$500,000. They came into possession of the mine several years ago, previous to which it had been explored by means of two tunnels run to the ledge, one being 500 and the other 1,000 feet long. As much as \$50,000 or \$60,000 worth of ore was drifted out and milled by the original owners. In 1872 the company put down a shaft to the depth of 200 feet, after which work was suspended for two years, when steam hoisting works were put up and sinking resumed. Latterly the mine has been under the management of Lewis Chalmers, Superintendent of the Exchequer, who has cleaned out the underground works, and put the whole mine in good shape for further active operations. The company own a good mill site with water power convenient to their mine, but no mill has yet been erected. The ore bodies and general appearance of the lode, so far as opened up, are much like those in the Exchequer, similar difficulties having also been encountered in reducing the ores.

## More of the Same Sort.

The Imperial, of London, also an English company, organized some five or six years since, own 10,000 feet on a series of parallel lodes in the Monitor district, on which they have driven a double-track tunnel a distance of 1,400 feet, cutting the first ledge in their series at a depth of 600 feet. This done, they ceased operations in order to await results in other tunnels being run for the same set of veins. As nothing determinate has been affected in these tunnels, this company are presumably still holding on, and it is more than likely they will continue in this condition of suspended animation for an indefinite period to come. Their expenditures have not been less than \$100,000, and may have been twice that amount. The history of the Mount Bullion company, another English institution, is not very different from that just recited. They, too, have a series of lodes which they have cut with a 2300-foot tunnel, have a mill with other appearances, and must have spent here \$100,000 independent of the purchase price of their mines.

## Among Other Mines Owned in the Eastern States

That have already cost the present owners large sums with no prospect of early returns, are the Monitor and Northwest, a Milwaukee company, who have a fine mill and a long tunnel—out, perhaps, \$200,000 on this property, and \$50,000 on the Silver Glance, another claim owned by them in the same vicinity; the Pittsburg, of Pennsylvania, out \$35,000; the Globe, for several years under the management of General Winchester, out, say \$100,000; the Advance, a live property with fair prospects; and some half dozen others that, after spending from \$10,000 to \$20,000 each, may now be considered defunct.

## Of Home Companies,

That is, those belonging to Nevada or California, the most of them incorporated, there are some 15 which have made an outlay ranging from \$20,000 to \$50,000, a good share of it consisting of labor expended. Prominent among these are the Mountaineer, George Washington, Pennsylvania, Lady Franklin, the Nohle, now the California, the Morning Star, etc., all of which have done a considerable amount of exploratory work, but upon very few of which anything is now being done.

**A CONTEST FOR MINING BOOKS.**—Thomas E. Atkinson, charged with the embezzlement of the books of the Howe Silver mining company, of which he was Secretary, was dismissed in the City Criminal Court on Monday. When the case was dismissed the complainants—that is, the company—attempted to seize the books under a Sheriff's order; but one of Atkinson's friends seized them and cleared out of the court, closely chased by Capt. Humphreys, Deputy Sheriff, who came up with him on Jackson street and took possession of the volumes, carrying them off in triumph. The defendant claimed that the present Board of Directors of the company had been illegally elected, and that he had a right to hold the books. The Sheriff's officer acted under a writ of replevin. The books are now in the possession of the Sheriff.

**NEW STEAM TUG.**—The Board of Harbor Commissioners advertise that proposals will be received for the hull and machinery of a new steam tug, to be used in connection with the new steam dredger, now in process of construction. On this tug will be placed one of the most improved fire engines, for protection to the water front.

## Award of Premiums at the Mechanics' Fair.

The Twelfth Industrial Exhibition under the auspices of the Mechanics' Institute, closed on Saturday, the 22d inst., after a most successful season. President Hallidie made a brief address, in which he said that the managers had good reason to congratulate themselves upon the success of the exhibition. On the 7th of August the fair was opened with an indebtedness of about \$22,000, and the doors would then be closed with the whole debt wiped out, and the vast building fully equipped with all the requirements for an industrial exhibition, including steam engine, boilers, etc., all paid for. The receipts from tickets and admissions had been \$53,997.44, and from privileges \$3,904.50, making a total of \$57,901.94. The total disbursements amounted to \$40,528.56, while the loans for construction of the building and street improvements repaid were \$10,919.25, and the taxes on property \$5,886.25. After paying off everything the balance in hand was \$567.88. Mr. Hallidie, in conclusion, said that the Superintendent and Secretary had been untiring and zealous, and by their care and good judgment had added much to the success of the exhibition.

We append a corrected list of all the awards, so far as made public up to this writing (Thursday night). The additional awards we will publish in our next issue, as the list will then be complete.

**CLASS 3.**—Dennis, Richardson & Co., tuyers, Lloyds' patent; California Bellows Factory, California bellows.

**CLASS 4.**—Emery saw-gummers, A. Potter; foot-power machines, Osborn & Alexander; hub-boring and hub-mortising machine, Meeker, James & Co.; foot-lathe, C. T. Marwedel; A. Potter, sand-papering machine; J. H. Small, planing machine; Pacific Saw Manufacturing Co.; best display saws; N. W. Spaulding, inserted teeth for saws; H. C. Root, saw set and clamp; F. A. Huntington, shingle machine.

**CLASS 6.**—Mining Machinery and Appliances—Kustel & Hoffman, amalgamator; J. Hendy, cam and shaft, Cochran's patent; J. Hendy, (\$1,000 challenge) ore feeder; J. W. Quick, ore screens; Prescott, Scott & Co., best general display of mining machinery.

**CLASS 7.**—Low & Chartrey, washing machines.

**CLASS 9.**—Hall Bros., schooner model; Etna Iron Works, iron propeller.

**CLASS 11.**—Excavators, Price Press Company; gopher traps, R. E. Wood, Santa Cruz; Buckeye mower and reaper, sulky wire rake and separator (gold medal), M. C. Hawley & Co.; gang plow, Sweepstake Plow Co.; lawn mower, J. E. Gordon & Co.

**CLASS 13.**—Cooking, Heating and Ventilating—Holbrook, Merrill & Co., stove, the "Bismarck," copper and japanned ware; W. W. Montague, Van's French iron range; J. B. Stetson, best general display tinware, oil tank; Williams & Howse, oil stove; Wm. Rennie, Boynton's tile parlor stove.

**CLASS 14.**—Bronzed hardware, Dunham, Carigan & Co.; firearms and fishing-tackle, Liddle & Kaeding; display of hardware, Huntington, Hopkins & Co.; display of carpenter tools, Stanley Rule and Level Co.; mining and blacksmith tools, Ahner Doble; tuning arrangement, Blackmar & Davis.

**CLASS 16.**—Will & Finck, best cutlery; W. F. Palmer, edged tools.

**CLASS 17.**—Atlantic Bottling Co., device for closing bottles; J. Brownell, chimney flues; Carlton Newman, boxed and covered demijohns; Pacific Glass Works, California manufactured glassware; Eureka Mantle Works, finest display marbleized iron mantles; John Daniels, marble mantles; E. L. Ransome, best specimen artificial stone; J. B. Owens, ironstone pipe; Snook Bros., ornamental artificial stone pavements; California Pottery Works, terra cotta work; W. Jones, encaustic tile; Grates and mantels—Yost & Van Leave, mantels of California onyx.

**CLASS 18.**—Brass works, gas and lamp fixtures, etc.—W. T. Garvatt, brass goods and bells; G. W. Snook, water filters; G. Simmonds, Simmonds' night lamp; Emile Boesch, reflectors and metal spinning.

**CLASS 19.**—Woodward's Gardens, specimens natural history; Blunt & Chapman, best specimens taxidermy; Joseph Newman, exhibit of silk worms and cocoons; Emerson, Corville & Co., best canned California salmon; Falkner, Bell & Co., best display of wool; Oregon & California Railroad Company, best display of grains; San Francisco Journal of Commerce, best display of products of California; Dr. Fraser, Nevada, sulphur; Specimens of gold, silver, and galena ores, Kinsey Lammis; mineral illuminating oil, California Star Oil Works; California pumice stone, Whittier, Fuller & Company.

**CLASS 20.**—B. H. Freeman & Co., display of stair work; B. Nathan & Co., general display of fancy and housekeepers' goods; Whittier, Fuller & Co., best mirrors; John Mallon, best ornamental and bent glass; R. K. Brehm, wood turning; Davis Bros., fancy carved brackets and frames; Louis Dampf, passe partouts.

**CLASS 21.**—Musical instruments—Kohler, Chase & Co., wind instruments; W. R. West, banjo, California manufacture; Paillard & Co., music boxes.

**CLASS 22.**—Vehicles and their attachments, etc.—Carriages, Kimball Manufacturing Company;

hacks, B. Graves & Co.; double buggy, Larkin & Co.; single buggy, Kimball Manufacturing Company; open buggy, Larkin & Co.; sulky, Larkin & Co.; child's carriage, Hamilton & Lawrence; carriage goods and hardware, Meeker, James & Co.; swing in operation, Hartman & Freese; hearse, T. S. Eastman; wagon and carriage wheels, Waterhouse & Lester.

**CLASS 23.**—L. & E. Emanuel, furniture, grand display; California Furniture Company, parlor and bedroom sets; West Coast Furniture Company, dining-room set, spring mattress; C. M. Plum & Co., easy chair, window drapery; Heywood Bros. & Co., assortment of chairs; Gilhert & Moore, school furniture; J. B. Luch-singer & Son, office desk, sideboard; R. E. Campbell, best mattress, spring and hospital bed; Wakefield Rattan Company, rattan furniture; California Spring Bed and Mattress Company, Crandall spring bed.

**CLASS 24.**—Billiard Tables—Jacob Strahle & Co., billiard tables.

**CLASS 25.**—Woodenware, etc.—Rutherford & Mitchell, automatic reacher; E. A. Stockton, step ladders; West Coast Furniture Company, best baskets; Jacob Unna, feather dusters and brooms; Figer Bros., brushes; Whittier, Fuller & Co., varnish brushes; W. W. Montague, metallic refrigerator.

**CLASS 26.**—W. A. Hephurn, arena; J. B. Dexter, bon-bons; J. Vogely & Brother, candy; Warren Cranston, Limburger and Swiss cheese; W. T. Coleman & Co., chocolate, cocoa and arena; Sweitzer & De Long, cider and vinegar; A. P. Adams, compressed coffee; San Francisco Produce Exchange, cornmeal; W. A. Hephurn, condensed milk; T. A. Gerry, preserved oranges; C. Pizalla, Italian and French sausages.

**CLASS 27.**—Display of California wines, Lang & Co.; sparkling wines, Landsberger & Co.; white wines, "Pearl Hock," sweet wine and port wine, H. Palmer, agent.

**CLASS 28.**—T. G. Cockrill & Co., whisky; Cheney, Souther & Co., wild cherry bitters; McMillen & Kester, green ginger brandy; L. Hess, bitters; H. A. Chalvin & Co., cordials; Boca Brewery Co., lager beer.

**CLASS 30.**—Display of toilet soaps, McKeone, Van Haagen & Co.; display of staple soaps and perfumery, Colgate & Co., New York; display of ammoniacal compounds, S. F. Gaslight Co.; yeast powder, Bowen Bros.; blacking, Henry Leake; soda water, Geo. C. Thompson; flavoring extracts, S. H. Nicholson; giant powder, Giant Powder Co.; display of artists' materials, glue, and assortment of paints ground in oil, Whittier, Fuller & Co.; varnishes, and Valentine's coach varnishes, Heuter Bros.

**CLASS 31.**—P. Kelly, boots and shoes; Main & Winchester, harness and saddlery; H. N. Cook, leather belting; E. P. Danforth, upper, sole and harness leather.

**CLASS 32.**—Best display of printing and wrapping paper, S. P. Taylor & Co.; paper manufactured from the "Yucca Draconis," Walker & Co.; gloves and gauntlets, Mills & Leak; best display of cordage, S. F. Cordage Company; Eureka hair, J. Herzog.

**CLASS 33.**—Woolens, dress goods, carpets, etc.—Alexander McKay, cocoa matting, California manufacture; California Silk Manufacturing Company, sewing silk and twist.

**CLASS 34.**—Gentlemen's furnishing goods, etc.—Boys' and youths' clothing, Joseph Bros.; best made and fitting shirts, S. A. Kusel; best display of gentlemen's furnishing goods, P. Beamish; best California made gentlemen's clothing, Lancaster & Northon; gold embroidery, Norcross & Co.

**CLASS 35.**—Bustles and corsets, Lyman Alexander; dress-cutting rule, Mrs. E. Higham; artificial flowers, Miss Minnie Schwegass; point lace, Mrs. R. W. Hathaway; worked lace, Mrs. Eliza Gerrish; dress reform garments, Abby W. Baker; ladies' and children's underwear, M. Freud & Son; Ahhy W. Baker, health corsets; Mrs. Sonnichsen, curtain ornaments; Mrs. G. F. Walter, fancy Turkish dress; Miss Carrie L. Wood, millinery. Jafferis & Co., water-proof crape; Miss K. S. Cole, paper patterns.

**CLASS 36.**—Printing, lithography, etc.—Bancroft & Co., fine book-binding; T. G. Newberry, maps of San Francisco; J. T. White, jucattis papyrograph; J. S. Hopkins & Co., copying press; A. L. Bancroft & Co., label printing; Kerchoff & Specht, sunlight printing; Wells, Hopps & Co., metallic signs.

**CLASS 37.**—Jewelry, etc.—A. F. Rochicolo, galvanic plaster work; W. K. Vanderslice, quartz jewelry; R. M. Jackson, abalone shell jewelry; Middleton plate Company, plated ware; San Francisco Plating Works, silver plating and replated ware; Schultz & Fischer, best design and workmanship in solid silverware; Kohler & Ritter, best design and workmanship in gold; Teuhner & Hoffman, silver plated show cases.

**CLASS 38.**—Improved surveying instruments, John Roach; electric pen, C. J. Simmonds; combination beam for scales, Buffalo Scale Company; telegraph and electrical instruments, California Electric Power Company.

**CLASS 39.**—Surgical and Dental Instruments—Menz Spring, artificial limbs; J. S. & S. Russell, electric bands.

**CLASS 40.**—Handwork, needlework, etc.—Mrs. J. W. Souther, crocheted quilt and tidies; Miss C. Sweeney, silk treading; Miss McCloskey, best crocheted bed spread; Mrs. E. J. King, quilted quilt; Mrs. Beaman, braided mat; Miss L. Marks, best tatting bed set; Miss Mary Bucklin, best specimen tatting; Mlle. Mourgeanna, best embossed work; Mrs. C. Butler, turkey feather cuffs and collar; Mrs. Theresa Corlett, best wax flowers; Mrs. A. G. Nye, moss album and sea moss, skeleton leaves; Mrs. J. E. Carter, best wax fruit, best wax cross;

Madam Anna Getz Lucas, one best preserved ferns and pitcher plant, two best preserved Autumn leaves; Mrs. A. O. Cook, best chemically preserved flowers and moulding in wax; Mrs. H. Stettin, best embroidery, silk, linen, and chenille; Mrs. Letheby, ornamental leather work; Mrs. J. Sullivan, applique work on Turkish cloth; Shepard & Co., hair work; Mrs. Letheby, Oriental cloth; Wm. Cameron, stamping patterns; Mrs. H. W. Worth, hair wreath; Mrs. W. S. Ferguson, spice wreath; F. P. Medina, shell work; Mrs. A. J. Nealy, worsted work; Mrs. A. Townsend, air castle, Miss M. Langrehr, (aged seven years), paper flowers; Mrs. M. Elliott, best display of decalcomania; Mrs. A. Mangelberg, worsted embroidery; Display of embossed embroidery, Mrs. Koerner; patchwork quilt, Mrs. Bateson; crocheted catan table-cover, Minnie Kinsman; ostrich feathers, A. J. Balmy; embossed worsted embroidery, M. Dunn.

**CLASS 42.**—Carving, etc.—L. S. Schumann, meerschaut work; Samuel Kellett, plaster ornaments; Guido Kustel, galvanic plating; M. Doyle, bust of Father Burchard; Thos. Gagliardi, plaster busts; I. Grundel, amber work; Wm. Rennie, Boynton's tile parlor stoves; Yost Van Leave, mantels and California onyx.

**CLASS 43.**—Engravings, drawings, etc.—C. Deaves, poster wood engraving; J. E. Montenegro, best specimen of pencil drawing (original); Mrs. R. C. Springer, best crayon drawing; Wolf & Son, best architectural drawing, executed by Frank P. Burnham; F. Serigni, best original pen drawing; Geo. H. Miller best architectural drawing by an apprentice.

**CLASS 44.**—Plain photographs and photogate, an improvement in cameras, H. W. Vaughn; photograph in oil colors, F. Bouvy; photographs finished in crayons, A. S. Hossack; photograph background, W. R. Swazy; instantaneous photograph of racehorse "Occident," E. J. Muiy-bridge; photograph in water colors, I. W. Taber.

**CLASS 46.**—Fruits and Vegetables—J. Runyan, Sacramento river, display of peaches, \$20; H. K. Cummings, display of pears, \$20; Land Department of Oregon and California Railroad Company, display plums and prunes, \$10; R. B. Blower, display of grapes, \$20; Dr. J. Strentzel, display of oranges and lemons, \$20; W. H. Murray, semi-tropical fruits, \$25; General George Deitzler, dried fruit (Alden process) \$25; dried vegetables, (Alden process), \$15; R. B. Blower, best display of California raisins, (medal), \$25; R. J. Trumbull, best display of garden seeds; General John Bidwell, special display of new California products; San Francisco Journal of Commerce, best continuous display of fruit, \$100; best continuous display of vegetables, \$25.

## Complimentary.

E. K. Downer, writing up the Mechanics' fair for the Marysville Daily Appeal, notices our pavilion stand with the following remarks:

Dewey & Co., as usual in the past, publish the Fair Daily, and the press is running every afternoon and evening, and attracts much attention from people from the rural and mining districts. It is replete with advertisements and spicy articles relative to the exhibition and the general advancement of the industrial arts. This firm publishes two of the most instructive and interesting journals west of the Rocky mountains [MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS], both of which enjoy a world-wide circulation. It is a treat to visit their press, composing and editorial rooms on Clay street, and business office on Sansome street, and notice the strict order that prevailed everywhere among the employees, and the varied and complicated departments in which they are engaged, under the able supervision of Mr. A. T. Dewey, the business manager. The inventors who have gotten out patents through their patent agency attest to the accuracy and promptness of these gentlemen in attending to their business here and at Washington. At their stand is now displayed some fine specimens of California dates, grown in Sonoma county.

## SAVAGE MINING COMPANY VS. SUTRO TUNNEL.

A year ago the Savage mining company brought suit against the Sutro tunnel company in the Fifteenth District Court to rescind a certain agreement made, by which the defendant claims to have a lien on the plaintiff's mine, and to compel the defendant to execute a release of the agreement. A demurrer was interposed to the complaint, which was argued, submitted and overruled by Judge Dwinelle in September, 1876, and the case was then taken into the United States Circuit Court, under a motion to remit cause of action under the Act of Congress of 1875, granting to Sutro the right of way for the purpose of draining certain mining property on the Comstock. Judge Sawyer has decided that he has no jurisdiction in the case, and has remanded it back to the Fifteenth District Court for trial. There are 10 or 11 other mines interested in the success of the suit.

A RAILROAD train on the Canada Southern railroad run 111 miles in 109 minutes on the 14th inst. This is the fastest time in America, beating by three minutes the remarkable time of Vanderbilt's special train. The distance was between St. Thomas and Amherstburg.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

(Continued from page 197.)

claim owned by Mr. Heckethorn. The specimen was a piece of gold, about two and a half inches long, little over an inch broad in the center, tapering down towards both ends, and about a third of an inch thick, weighing nine ounces. It is valued at \$125. The slight of this little specimen has completely cured us of the black hills fever, and we now have Osceola on the brain.

### TUSCARORA DISTRICT.

**PAOR, STEWART'S OPINION OF THE DISTRICT.**—Gold Hill News, Sept. 21: Although Tuscarora is the only free ore yielding district in Nevada outside of the Comstock, and although it bids fair to be in the near future a rival to the great mining zone at the base of Mount Davidson, yet fortune cannot be picked up at the new Dorado without the expenditure of much patience, hard work and hard cash. Impetuous persons should hesitate before making a blind rush to Tuscarora. Hundreds of men are flocking to the new camp from Idaho, Montana and Utah, as well as Eastern Nevada. Most of these men are in search of employment, and are usually penniless when they arrive at the camp. It is stupidly absurd to suppose that this class of adventurers can obtain work in a new silver-mining district. Already the town of Tuscarora is overstocked with poverty-stricken idlers, many of whom have not even a blanket to protect them from the sharp winds of Independence valley. Tuscarora is improving as rapidly as mechanics can build dwellings and shanties, but it is quite apparent that the present population cannot be assimilated before the winter season. The winter season in northern Elko county is usually severe, and lasts for seven or eight months. Men who are not prepared to meet these contingencies will act wisely by deferring their visit to Tuscarora till next April or May. To those who can raise means enough to build shanties and procure fuel and provisions for the winter, the present is a propitious time to locate at the great bonanza of the north, for in my judgment there are "millions in it."

### WARD DISTRICT.

**RICH ORE.**—Ploche Record, Sept. 22: We were shown on Tuesday last, by A. J. Blair, an assay of some ore taken by himself from the Ploche mine, situated in Ward. The ore was made by Hoffman, and showed \$5,774.57. The ore was taken from the depth of 160 feet, from a drift where the ledge had just been tapped at that depth. T. J. Bell is the principal owner of the mine. Mr. Blair having visited and reported on it at his request.

### WHITE PINE DISTRICT.

**A STRIKE IN THE JENNIE A.**—White Pine News, Sept. 22: We learn that an important strike was made a few days ago in the lower workings of the Jennie A. mine, which fully sets at rest the uncertainty under which the management has been laboring for some time in regard to a continuation and enlargement of the vein in the depth. Parties who have visited the mine since the late development was made express the opinion that the company have a very valuable property. The latest discovery of ore is all that prevents the immediate erection of reduction works by this company.

### Dakota.

**THE BLACK HILLS.**—New Northwest, Sept. 12: From Mr. Clagett we gathered a few items concerning the Black Hills country, when he left it a fortnight ago. The bulk of the population in the Black Hills is gathered in a parallelogram, 50 by 60 miles in extent. The present population is variously estimated at from 20,000 to 35,000 people. Mr. Clagett estimates it at 30,000. There are now some 30 quartz mills running. The gold is all free, except some white iron ore, which is run through an ordinary furnace, and then treated with cyanide of potassium. Only one stamp mill is set up and furnished with six months' supplies for \$5,000. Ore near the mills can be mined, hauled and treated for \$1.50 to \$2.00 per ton. The ore beds are comparatively inexhaustible, as \$3 and \$10 ore can be profitably handled, and it exists in enormous quantities. The character of the population is changing, the immigration of poor people falling off, and men of means coming in. He thinks it a good country for a reasonable population, but the vast majority of the immense throng who came last season were disappointed and returned or went north. Only one of the expeditions north found gold in paying quantities, and they were disappointed and driven in by Indians. Deadwood contains some 4,000 to 6,000 people. The majority are engaged in their own business, and are away up with people from other countries. Mr. Clagett is personally doing well and expects to remain in Deadwood.

### Idaho.

**RED WARRIOR DISTRICT.**—Cor. Idaho World, Sept. 21: In the Red Warrior district there are several good paying mines; among them the Governor Bennett mine, owned by Mr. Seoval, and the celebrated Avalanche mine, worked for years by John Thomas & Co. Recently Mr. Adam Gottsch purchased one-half interest in the mine for the sum of \$200 cash. The mine was worked 100 feet deep, showing a well-defined vein for 200 feet in length. There is a lower tunnel partly completed, to run this tunnel 50 feet further. They will tap the ledge 150 feet below the present level. They have sufficient quartz in sight to keep them working for years.

**ROCKY BAR.**—Here at the Bar times are assuming a rather dull appearance, not owing to any scarcity of rich and extensive mines, but owing to deficient capital to work them. We are situated so remote from railroads that moneyed men appear to shun the rich and extensive mines of Idaho, which will yet astonish the world. The Bonaparte mine is under the superintendency of Prof. Winn, and Mr. McKin, foreman. They have the mine opened up splendidly, showing a well-defined vein of from 20 inches to three feet of rock that will go from \$50 to \$150 per ton. They have the ledge opened and fully prospecting nearly 300 feet deep, and several hundred feet in length, showing \$1,000,000 worth of rock in sight. I am informed, on good authority, that the Monarch company's mine is looking better than ever. The Bleisoe company are down 80 feet and cross-cutting for the ledge. The Buffalo company shut down their mine for the present, not on account of any financial cause, but owing to having plenty of milling ore to keep their mill and furnaces running until next summer. The company have plenty of money to meet all demands.

**FOREIGN RAILROAD NOTES.**—It has been proposed in Germany to indicate all stations, to the public as well as the employees, by numbers, and to print on tickets, under the numbers indicating between which the passenger rides, the time the train is due at his destination, to prevent his being uneasy lest he may miss it. Thus, suppose New York to be station 1 and Philadelphia 15, and the train due at Philadelphia at 4 P. M., the face of the ticket would read: "1-15" (in very large figures), and underneath these figures: "4 P. M." The traveler, knowing he was not due till 4 P. M., would not be likely to begin to worry until near that time. Then it is claimed that station signs could be made much plainer by figures than by letters, because they could be very large, and on transparencies which could be illuminated and easily seen by travelers during the night.

**JOHN W. AMES,** son of Judge Ames, of the Supreme Court of Massachusetts, but now a resident of California, has been appointed Surveyor-General of this State.

### General News Items.

**URBAIN JEAN JOSEPH LEVERRIER,** the famous astronomer, is dead.

A \$10,000 fire occurred on Commercial street, in this city, on Monday evening.

**ELECTIONS for deputies in France** are ordered for the 14th of October, and the session of the Chamber of Deputies is called for November 7th.

A TELEGRAM received from an official source in Yeddo, says that the rebellion in Japan is ended. The chief of the rebels committed suicide on the 24th instant.

**PARTIES** behind the scenes declare that Tweed is not making a clean breast of it, or exposing any of his old friends who were in the ring that sympathize with him.

**THE death, at London,** is announced of Rev. Joseph Richey, of Baltimore, one of the leaders of the Ritualistic party in the Episcopal church of America.

**LARGE SUMS** of Canadian money have recently been stolen while passing through United States mails. A woman lately exchanged with a Chicago broker for American money, \$5,000 in Canadian bills, all of which turns out to have been lost in American mails.

A PLENTIFUL rain has fallen in many of the worst famine districts in India. Agricultural work is active and crops are making rapid progress. There can be no reasonable doubt that the tide of the great calamity has been turned, but vast numbers of those who survive actual famine must still succumb from their enfeebled condition.

**LETTERS** from Col. Corby, Secretary of the Sitting Bull Commission, says: We expect to reach the border by the 30th inst. Our latest advice is to the effect that his reclining majesty is enjoying himself quietly in Canada. Expect us in Washington early in November, perhaps as early as the latter part of October.

**THE official visitors to the West Point Military Academy** recommend that a commission be constituted to report such changes in the organization and course of study as shall promote its usefulness. Among the recommendations is one that inquiry be made as to the possibility of abolishing military parades on the Lord's day.

**PRIVATE efforts** have opened the way whereby applications for space at the French exhibition, next year, can be made and granted without waiting for the tardy action of Congress. Nearly 1,000 applications have been in charge of the United States Legation in Paris, which the French government would not consider because they were not supported by any official action on the part of our Government. This formality, however, the French authorities have consented to waive.

### New Incorporations.

The following companies have filed certificates of incorporations in the County Clerk's office, at San Francisco:

**PIRREURO G. M. Co.**—Sept. 21st. Location: Nevada. Capital stock, \$10,000,000. Directors—Henry Fisher, T. C. Lampe, J. H. Dinert, Jr., Frederick Engelken and Philip Kitz.  
**BELLE LAKE M. Co.**—Sept. 21st. Location: Elko county, Nevada. Directors—G. W. Grayson, Dwight Crittenden, M. Herman, Stephen Roberts and M. Dambith. Capital stock, \$10,000,000.  
**BREITERT O. M. Co.**—Sept. 21st. Location: Mono county, California. Directors—W. M. Lent, F. K. Bechtel, W. B. Carr, W. M. Stewart and B. B. Minor. Capital stock, \$6,000,000.  
**SOUTH SPRING M. Co.**—Sept. 21st. Location: Amador county, California. Directors—Benjamin Flint, John Tregloan, J. R. Tregloan, W. H. Reynolds and G. P. Thurston. Capital stock, \$6,000,000.  
**TIPTOP S. M. Co.**—Sept. 21st. Location: Arizona. Directors—P. F. Van Rensselaer, S. F. Gashwiler, E. O. De Crano, A. E. Head and Henry Janin. Capital stock, \$10,000,000.  
**AWONAUT M. Co.**—Sept. 22d. Location: Arizona. Directors—John F. Cassell, Henry H. Wood, Ira G. Hoitt, T. P. Palmer and Joseph Pentecost. Capital stock, \$3,000,000.  
**PAWNEE M. Co.**—Sept. 22d. Location: Nevada. Directors—S. Heydenfeldt, Delos Lake, Charles Allenberg, C. L. Perkins and James McMechan. Capital stock, \$10,000,000.  
**INDUSTRY G. & S. M. Co.**—Sept. 22d. Location: Nevada. Directors—Charles T. Behan, John E. Sisson, V. S. Eggleston, J. R. Brann and H. F. Whitman. Capital stock, \$10,000,000.  
**GOLDEN PRIZE M. Co.**—Sept. 24th. Location: Elko county, Nevada. Directors—J. B. Haggin, Wm. Norris, P. B. Cornwall, Robt. Sherwood and B. Holladay, Jr.

**MACHINE WORK IN SACRAMENTO.**—We learn, at the Union Foundry of Root, Neilson & Co., that the general run of work has been good this year, notwithstanding the dry season. They manufacture and repair a good deal of agricultural machinery, in addition to their mining, engine, steamboat and general machine work. This pioneer foundry keeps the lead in Sacramento, with a yearly increase of business. Lately the proprietors added to their large lot 35 feet more in frontage.

**COPPER.**—It has been found, in working the flue dust, that it carries a large percentage of copper. On being taken from the roasting furnaces and spread out on the cooling floor, it cakes and turns green from exposure to the air. On account of this fact no bluestone is used in the pans. The only base in the amalgam is this same copper, and in the lower grade it will run as high as 50%.—Eureka Sentinel.

**MORE valuable** than oil paintings, are the mammoth pictures produced by G. D. Morse at his emporium of photography, No. 417 Montgomery. They don't have to be varnished and worked over to preserve them.

### PATENTS AND INVENTIONS.

#### List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING SEPTEMBER 4TH, 1874.

**ROASTING ORES.**—Edmund Green and Abraham Halsey, N. F.  
**COVERS FOR LIQUID MEASURES.**—Charles C. Redmond, Santa Clara, Cal.  
**FLOATING BATH STRUCTURE.**—Francis Despol and Joseph Reboul, S. F.  
**ORE WASHER.**—Joseph S. Durcan, S. F.  
**DEED BOTTOMS.**—Bartholomew Essig, Sacramento, Cal.  
**FRUIT DRIERS.**—Wm. W. Ferguson.  
**BELTING.**—Herman Royer, S. F.  
**ROTARY FRISTING PRESS.**—Marshall Hahnke, S. F.  
**MOQUITO BARS.**—Margaret Patrie, Vallejo, Cal.  
**ELECTRO-MAGNETIC ALARM BELLS.**—Paul Seiles, S. F.  
**TRADEMARKS.**  
**STOMACH BITTERS.**—Eugene L. Bataux, S. F.  
**RAZORS.**—Natan Joseph, S. F.

WEEK ENDING SEPTEMBER 11TH, 1877.

**WATER CLOSETS.**—John R. Adams, Oakland, Cal.  
**GRAINING MACHINES.**—Wm. O'Day, S. F.  
**STONE LATHES.**—Frank Kessler, S. F.  
**CAR COUPLINGS.**—Wm. Lane, S. F.  
**PROJECTILES FOR SMOOTH-BORE CANNON.**—Joseph R. N. Owen, Hamilton, Nev.  
**SOLDIERING BOXES.**—Thomas J. Walsh, S. F.  
**PNEUMATIC DENTAL MALLETS.**—Samuel W. Dennis, S. F.  
**WINDMILLS.**—Nicholas Holden, San Jose, Cal.  
**SKWER TRAP AND FLUSHING GATE.**—John Peter Schmitz, S. F.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

**NOTE.**—Copies of U. S. and Foreign Patents furnished by DEWEY & CO. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

#### California Fruit Growing Association.

Location of principal place of business, San Francisco, Cal.  
Location of property, El Dorado Co.  
Notice is hereby given that at a meeting of the Board of Directors, held on the fourteenth day of August, 1877, an assessment (No. 8.) of 23 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 331 Sansome Street, San Francisco, Cal.  
Any stock upon which this assessment shall remain unpaid on the fourteenth day of September, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the first day of October, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. HORACE JONES, Secy.  
Office, 331 Sansome St., San Francisco, Cal.

**POSTPONEMENT.**—The day for decimating the stock delinquent on the above assessment is hereby postponed until Saturday, September twenty-second, 1877, and the sale thereof until Monday, October eighth, 1877. By order of the Board of Trustees. HORACE JONES, Secy.

#### Dolores Consolidated Mining Company.

Location of principal place of business, San Francisco, Cal.  
Location of works, Wilson Mining District, Esmeralda County, Nevada.  
Notice.—There are delinquent on the following described stock, on account of assessment No. two (2), levied on the seventh of August, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Blasdel, H. G., trustee (left of certificate No. 16).....	155	5000	\$625 00
Blasdel, H. G., trustee (left of certificate No. 17).....	156	2500	312 50
Blasdel, H. G., trustee (left of certificate No. 18).....	157	2500	312 50
Blasdel, H. G., trustee (left of certificate No. 19).....	158	2500	312 50
Brannan, Joseph.....	54	25000	3125 50
Drexler, L. P. & Co., trustee (left of certificate No. 5).....	150	12500	1562 50
Fry, J. D., trustee.....	7	10000	1250 00
Keene, J. R., trustee.....	9	10000	1250 00
Richardson, E. A., trustee.....	48	6000	750 00
Richardson, E. A., trustee.....	49	100	12 50
Richardson, E. A., trustee.....	50	100	12 50
Richardson, E. A., trustee.....	51	40	5 00
Williams, John H., trustee.....	30	50	6 25
Wacker, Gustavus.....	47	18747	2343 37 1/2

And in accordance with law, and an order of the Board of Directors, made on the seventh (7th) day of August, 1877, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Secretary,

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,

Hammered Iron of Every Description and Size  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

HENRY S. SMITH

## ÆTNA IRON WORKS,

MANUFACTURERS OF

## IRON CASTINGS

and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

## SHEET IRON PIPE.

## Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.  
Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

## PHELPS MANUFACTURING COMPANY.

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

## SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

## HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Girders, Bridges  
and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.  
Repairing promptly attended to at the  
lowest possible terms.

## GOLDEN STATE & MINERS' IRON WORKS.

Manufacture Iron Castings and Machinery  
of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

## CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cooks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Coupl-  
ings and Connections of all sizes and patterns, furnished  
with dispatch. PRICES MODERATE.  
J. H. WEED. V. KINGWELL

## California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

BIRCH, ARGALL & CO.,

Builders of QUARTZ, SAW AND FLOUR MILLS,  
Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,

And General Machinists

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE  
**Hoisting Engines,**  
For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,  
RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

THOMPSON BROTHERS,  
**EUREKA FOUNDRY,**  
Light and Heavy Castings of Every De-  
scription Manufactured.

Sole Proprietors and Manufacturers of

Lynch's Ventilating and Illuminating Tile,  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

## STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

## McAFEE, SPIERS & CO.,

BOILER MAKERS AND

GENERAL MACHINISTS,

Howard between Fremont and Beale Sts., San Francisco.

## Machinery.

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—2½ Cords at 83 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61½  
In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

D. J. O'HARRA,  
Reno, Nevada.

## THE LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

## BRUCKNER'S PATENT REVOLVING FURNACE,

For Chloridizing, Desulphurizing and  
Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEAR-  
ING AND MINING MACHINERY.

Send for our Illustrated catalogue.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER

J. C. Sanderling, Sole Ag't Pacific Coast  
51 Fremont Street, S. F.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

## TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
PETITOR. For particular information regarding  
this or Air Compressors, send for circular to

J. B. REYNOLDS,  
320 Sansome Street,  
(Room 10.)

## Buy the Best.

Before purchasing an American  
Watch, examine the different styles  
manufactured by the HAMPDEN  
WATCH COMPANY, at Springfield,  
Mass. They are the latest and  
best improved manufacture. You  
can depend upon them for fine finish,  
durability and perfect time. They  
are sold at favorable prices—in  
fact, no higher than many of the  
inferior styles. Examine into the  
merits of this Watch before you  
buy any other. Our word for it,  
you will not regret it.

DEWEY & JORDAN, Agents,  
433 Montgomery St., S. F.

## ARTIFICIAL LIMBS.

MENZO SPRING,

MANUFACTURER OF

ARTIFICIAL LIMBS.

OFFICE AND ADDRESS,

9 Geary St., San Francisco.  
Descriptive circulars, blanks for  
measurements, with instructions and  
price list free on application.

## MINING INTEREST FOR SALE.

For a small amount, in several claims on one of the

RICHEST LEDGES IN ARIZONA.

Money needed for development. The ore will pay a hand-  
some margin to ship to the city. Apply at this office.

## Metallurgy and Ores.

JOHN TAYLOR & CO.,

Importers of and Dealers in

## ASSAYERS' MATERIALS.

CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
etc., manufactured by the Patent Plumbago Crucible  
Co., of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.  
Also, to our large and well adapted stock of

## Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.  
Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

JOHN TAYLOR & CO.

THOS. PRICE'S

## Assay Office and Chemical Laboratory,

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and re-  
turns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of  
the interior by Express, and returns made in the same  
manner.

Careful Analysis made of Ores, Metals, Soils, Waters,  
Industrial Products, Etc. Mines examined and reported  
upon. Consultations on Chemical and Metallurgical  
questions.

## Nevada Metallurgical Works,

No. 23 STEVENSON STREET.

Near First and Market Streets.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process  
for working Ores.

Special attention paid to Examinations of  
Mines; plans and reports furnished.

Chemical Analysis, Determination of Minerals, and use  
of the Blow-pipe.

## HENRY G. HANKS

Will receive a few pupils at his new laboratory, No. 61  
Montgomery Street, up-stairs. TERMS MODERATE.

## STRONG & CO.,

Assayers and Metallurgists,

10 STEVENSON STREET, S. F.

## HUNT, DOUGLAS & STEWART Process,

Used in Connection With PURVINE

## Wooden Amalgamating Pans and Settler.

This is a complete, perfect and economical adaptation  
of the humid method to the treatment of Gold or Silver  
ores, associated with

## COPPER

And other base metals, or to ores free from base metals.  
It can be adapted to any first-class Gold or Silver mill, at  
a reasonable additional expense.

For further information, address

J. O. STEWART,  
Georgetown, Colorado.

## To Ship and Engine Builders, Steam ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.

Address and references can be obtained at office of Sci-  
entific Press.

# \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

## ENDORSED BY THE FOLLOWING PARTIES:

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

# REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and retreating themselves in their rights.

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, as closely resembling pure gold that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold known. GENUINE AMERICAN MOVEMENT. EXPANSION BALANCE. BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS FROM \$150 TO \$200. It sells and trades readily, for from \$20 to \$30, and if you wish a watch for your own use or to make money, we try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are used on Railroad, Steamers, and in Minniefactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express on receipt of \$12, to any part of the Country, or it will be sent C.O.D. when the customer desires and remits \$3 on account. These Elegant CHAINS weigh about fifty Pennyweights, and the same pattern in pure gold would cost \$100. We sell these Chains at \$3 each. But we sell the Watch and Chain for \$12, sent by Mail in a Registered Package, post-paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &  
CO., MINING AND SCIENTIFIC PRESS Office, S. F.BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.Roasting of Gold and Silver Ores, and the  
Extraction of their respective Metals without Quick-  
silver. 1870.This rare book on the treatment of gold and silver ores  
without quicksilver, is liberally illustrated and crammed  
full of facts. It gives short and concise descriptions of  
various processes and apparatus employed in this country  
and in Europe, and explains the why and wherefore  
It contains 142 pages, embracing illustrations of fur-  
naces, implements and working apparatus.It is a work of great merit, by an author whose reputa-  
tion is unsurpassed in his specialty.  
Price, \$2.50 coin, or \$3 currency, postage free.Concentration of Ores (of all kinds), including  
the Chlorination Process for Gold-bearing Sulphurets,  
Arsenurets, and Gold and Silver Ores generally, with  
120 Lithographic Diagrams. 1887.This work is unequalled by any other published, em-  
bracing the subjects treated. Its authority is highly esteemed  
and regarded by its readers; containing, as it does, much  
essential information to the Miner, Metallurgist,  
and other professional workers in ores and minerals, which  
cannot be found elsewhere in print. It also abounds  
throughout with facts and instructions rendered valuable  
by being clearly rendered together and in simple or-  
der. It contains 120 diagrams, illustrating machinery,  
etc., which alone are of the greatest value. PRICE, \$7.50.

## The P. K. Dederick Patent Iron Horse Hoisting Engine.

FOR SALE BY

MARCUS C. HAWLEY &amp; CO.

Nos. 301 to 309 Market St.

Corner Beale Street,

SAN FRANCISCO, CAL.

It is, as its name designates,  
a complete Horse Engine, hav-  
ing every advantage of the Steam  
Hoisting Engine, with much the  
advantage in cost, portability  
and economy, and every way  
more desirable, the expense of  
operation being less than half  
in accomplishing the same work  
in the same time; and instead of  
the delay and expense attending  
the transportation of steam pow-  
er, which necessitates its move-  
ment only for large jobs, the portability of this machine is such that it may be picked up bodily and carried, and may be  
moved for the smallest jobs, as it is ready for work as soon as thrown down, and may be operated in a circle ten feet in  
diameter if desired.By simply changing the size of the drum, the velocity and power of the machine may be varied to hoist as fast as the  
horse walks, or slow enough for the greatest power, so that if a machine is used for such a variety of purposes that a suffi-  
cient variation of power cannot be secured by wyeing or tacking the line, then a change of drum will secure it; in fact,  
is a much quicker and better method than tacking. We claim for this machine the strongest, most durable, convenient  
and accurate operating Hoisting Machine, and we think we may add the prettiest little machine since the invention of the  
steam engine. Its advantages for unloading vessels, hoisting brick and mortar, for mining and quarrying, and for general  
hoisting purposes, are so evident, that we may predict that they are destined to become an indispensable tool in all such  
pursuits. It is an Iron Machine, and consists of a double-faced spur wheel, fitted to revolve around a stationary iron frame  
or circle, with a shaft passing diagonally through both frame and wheel, and secured to the frame by boxes, thus forming  
journals, and geared to the drive wheel by pinions at each end and on opposite faces of the wheel, thus communicating the  
power to both ends of the shaft at the same time. On this shaft the drum for winding the rope on is suspended, with a  
clutch for attaching or discharging it, and a friction strap around the drum for regulating and retarding the uncoil of the  
line, or lowering of the weight. The iron frame is bolted firmly to the wood frame or bed, and a seat secured to it, the  
whole being immovable, and the horse revolves the drive wheel around it, thus revolving the pinions and communicating  
motion to the drum shaft. A mitchet attached to the frame secures the drive wheel from running back when the horse  
stops.

VOLUME XXXV.  
Number 14.

## The Loss by the Patent Office Fire.

The losses to the country by the Patent Office fire were very great. In the north hall the models to the following inventions were entirely destroyed: Wood-working (four classes), wood screws, wire-working, water wheels, water distribution, tubing and wire, stabling, sheet metal, seeders and planters, saws, railways (four classes), pumps, pneumatics, plows, ores, needles and pins, nails, mills, metal-working (seven classes), metallurgy, horse shoes, harvesters, harrows, hardware manufacture, grinding and polishing, garden and orchard, files, dairy, casting, brakes and gius, nuts and rivets, bolts, bee-hives, baths and closets, aeration and bottling. Aggregate number of models destroyed in this hall, 57,000; valued at \$885,000.

In the west hall the following were burned: Models of bridges, brushes and brooms, tobacco, threshing, lime and cement, stone roofing, presses, paving, mechanical powers, car couplings, masonry, churns, journals and bearings, engineering, hydraulics, hoisting, glass, fences, excavators, carriages, and wagons, carpentry, butchering. Aggregating 36,500 models at a total value of \$511,000.

In the east and south halls, besides the famous relics of the father of our country and other patriots, models of the following inventions escaped destruction: Sewing machines, fire arms, looms, carding machines, trunks, taoning, surgery, sugar, stills, signals, preserving food, plating, paint, optics, fats and glue, oils, measuring instruments, manures, leather, ice, hose and belting, horology, harness, gunpowder, gas, fuel, electricity, drafting, dental, cutlery, coffins, clay, clasps and buckles, chemical miscellaneous, caoutchouc, boots and shoes, bleaching and dyeing, beer and wine, artificial limbs, felting and hats, fine arts, fishing, furniture, games and toys, governors, jewelry, kitchen utensils, knitting and netting, lamps and gas fitting, laundry, locks and latches, music, ordnance, paper making, paper manufactures, photography, printing, projectiles, safes, ships (two classes), silk, spinning, stationery, steam, stoves and furnaces, toilet, umbrellas and fans, valves, weaving, educational, dryers and kilns, crimoline and corsets, cordage, cloth, builders' hardware, book binding, boats, beds and apparel.

## The Dexter Scroll Saw.

Since the advent of the Fleetwood scroll saws, some four years ago, and which were the first really practical machines of the kind for fine work, many different styles have been introduced. A new machine, made by the same manufacturers, is shown on this page. It has just come out, is simple and graceful, thoroughly made of the best materials, durable, light running and accurate in execution, besides being sold at a remarkably low price. Any further description of the machine is unnecessary, as the cut plainly shows its construction. Information as to price, etc., can be obtained of the inventors and manufacturers, Trump Bros., Wilmington, Del., or C. F. Marwedel, 56 First street, San Francisco, who has all the machines of their manufacture for sale.

**THE EMMA MINE.**—The Salt Lake Herald says: It appears by the Emma lease, the mine is not to be so extensively worked as was at first thought. The lessee, we understand, is to make no developments, merely confining his operations to the old workings. However, there is known to be considerable ore that can be taken out without breaking new ground. The lease, nominally for two years, permits the owner, Trenor W. Park, to resume possession of the property at any time upon payment to the lessee of a certain sum. It is probable that within a few months, at the outside, Mr. Park will put a force of men at work and find out for a certainty what there is in the Emma.

The coinage at the Mints of the United States in the month of September was: Double eagles, \$4,492,200; trade dollars, \$1,677,000; half dollars, \$408,400; quarter dollars, \$349,600; dimes, \$129,000. Total, \$7,056,200.

## An Improved Quicksilver Condenser.

In the condensation of mercurial vapors it has long been customary to perform this work in dry chambers which are kept cool in various ways, and in some instances a spray of water has been showered down through a tower to meet the upwardly-moving vapor, so as to condense it. It has hitherto been found difficult to introduce mercurial vapors beneath water so as to condense them by actual contact, on account of the difficulty in properly discharging such vapors at the bottom of a tank, and because if the pressure necessary to overcome the weight of the water and the consequent back pressure and attendant leakage of fumes between the furnace and condenser. It has been customary to conduct the mercurial vapors through a number of brick, iron or wooden chambers, kept cool in various ways, but the difficulty has been to prevent waste by fumes escaping uncondensed. The condenser illustrated herewith is designed to overcome these difficulties, and was patented through the MIN- AND SCIENTIFIC Patent Agency by Wm. H. Long and Alexander W. Castle. The invention consists of a vessel wherein the vapors are conveyed beneath the surface of the water contained therein by the centrifugal force caused

Castle & Long's Quicksilver Condenser.

by the motion of hollow, open-ended arms, which unite with the central hollow conveying tube, and are caused to rotate with it by suitable mechanism. A supply of cold water is kept up, a suitable trap is provided for withdrawing the metallic mercury without the water, and stops are placed within the condenser to prevent the rotation of the water by the action of the arms.

In the engraving, *A* is a square chamber, of which as many may be placed in succession as may be desired. This chamber has a pipe, *B*, which enters at the top, and extends down toward the bottom in an axial line of the chamber. This pipe is stationary, and another pipe, *C*, extends upward into the pipe, *B*, so as to turn easily, but make a close joint. The journal of the pipe, *C*, extends through a stuffing-box, *D*, at the bottom of the vessel or chamber, and by means of a bevel-gear, *E*, and shaft, motion is communicated to the pipe, *C*. Near the bottom of the chamber this pipe is provided with hollow arms, *G*, *G*.

In the engraving two arms are shown projecting from the pipe, *C*, but as many may be used as may be useful. The arms may be of any desirable shape, but are shown here as triangular in section, this form giving less resistance as the arms pass through the water. At their extremities these arms are bent, or made, as in the present case, with an opening at the back of the outer end.

The operation will then be as follows: The furnace being in operation the fumes will arrive

at the chamber through the pipe, *B*. The pipe, *C*, is caused to rotate with sufficient rapidity to produce a vacuum in the arms, *G*, resulting from their passage through the body of water, said arms also acting as agitators during their passage through the water. This causes the fumes to rush down the pipe, *C*, out through the arms, *G*, and thence into the water, being thoroughly distributed by the movement, and discharged without any objectionable back pressure upon the furnace or retort. The mercury will thus be condensed, and will fill the rim around the edge of the bottom, which is made convex in the center for that purpose. When a sufficient amount has collected the mercury will commence to flow out through the pipe, *H*, which is bent upon itself, as shown, so as to form a trap and prevent any water from escaping.

The chamber being square rectifies any tendency of revolution of the water. The water is kept cool by allowing the current to enter at the pipe, *J*, and escape at either of the openings, *K*, as may be desired. The top of the chamber is perforated for the escape of any uncondensed fumes or gases which may be led by pipe into another like chamber. As each chamber is provided with its own exhausting or vacuum-producing mechanism, it will be manifest that as many as may be desired can be used without producing any back pressure or influence upon any of the others.

It will be noticed that the arms act as agita-

The Mounted Dexter Scroll Saw.

tators, thoroughly distributing the vapor through the water, and dispensing with an additional agitating device, which has been found necessary where, in the place of the arms a centrifugal wheel was used, consisting of a hollow circular disk.

The inventors claim that their improved condenser will save every particle of quicksilver for a quarter of the cost of the various kinds in use. The condenser will also be found useful in all chemical works, lead works, etc., where poisonous gases are apt to escape in the fumes. It can be attached to a stack, and draws off the fumes wherever necessary, forcing the fumes under water of any required depth, so as to condense them. Those desiring further particulars may address Wm. H. Long, San Jose, or A. W. Castle, Guadalupe quicksilver mines, Santa Clara county.

**ACADEMY OF SCIENCES.**—The California Academy of Sciences met on Monday night, Vice-President Hyde in the chair. There were no donations to the cabinet. Dr. Kellogg read a description of three new plants—*Malastrum maritimum*, collected by the late Dr. Veatch in Lower California; and *Collomia gilioides*, found by Henry Edwards on the Sierra Nevada mountains, and a variety of *Penstemon*, or beard-tongue, found by him at Fremont's Peak, 8,000 feet above the sea.

It is estimated that 750,000 persons have died from famine in India.

## The New Stock Exchange.

The new building of the San Francisco Stock and Exchange Board was formally opened on Monday. The building is one of the finest in the city. The corner-stone of the new structure was laid April 27th, 1876, and since then work upon it has been pushed vigorously. It is five stories in height, with a tower surmounting the center. It is built throughout of granite in different colors and forms of polish, and all the materials in its construction are of the costliest character. The exterior of the building is very handsome, the facade being especially rich with its alternate layers of light and dark colored granite, its broad entrance, crowned by a group of statuary, its massive pillars of polished granite and its innumerable plate-glass windows. The dimensions of the building are 77 feet 9 inches on Pine street, by 137 feet 6 inches in depth, and the main building is 82 feet high, the tower rising 65 feet above the roof. The general plan of the building has been to provide magnificent offices for brokers, and at the same time to provide a splendid room for the Board sessions. The main entrance, therefore, is flanked on either side by spacious offices, the chief feature of which are the immense windows, framing single sheets of glass 15 feet 6 inches by 10 feet. The main entrance has a flooring of the finest English tiles, the walls are wainscotted with black and gray marble, and fronting the visitor are the great doors opening into the vestibule. These doors are very elegant, being made of oak-wood and elaborately carved. On the right of the entrance is a row of letter-boxes for the different offices in the building, each box being fitted with an electric bell and a speaking-tube. Passing through the carved doors above mentioned, one enters the vestibule, on either side of which is a good-sized committee room. Another pair of handsome doors being passed, the visitor finds himself in the Board room. It is about 77 feet square, and 47 feet to the ceiling, which is semi-domed, and so perforated as to make the ventilation perfect. The room is an irregular octagon, in the center of which is a large oval space for the use of members in their dealings. Around this oval are ranged two rows of chairs, 80 in number, handsome in design and commodious in shape. Back of them runs a black walnut railing, behind which are placed 132 seats for privileged spectators, while standing room is left for nearly twice as many more. The room is wainscotted with Belgian black marble, 14 inches wide, above which, to a height of five feet six inches, runs a broad paneling of grayish marble from Knoxville, Tennessee. Above this again extends a paneling of beautifully carved primavera wood.

At the southern end of the room stands the caller's rostrum, built of black walnut, behind which is a frescoed alcove, and above an arch of carved wood, supporting on either side a bear chiseled from the same wood, and in the center the coat of arms of California cut in the same material. Back of the rostrum are two large fire-proof safes, set into the wall, in which are kept the books and papers of the Board. A wide gallery extends around all but the southern portion of the room, of which a portion is set apart for the use of the ladies, and around it runs a rich bronze railing, which is relieved by alternate heads of bears and hulls. A peculiar feature of the room is that the gavel is dispensed with, a large gong being used in its stead, and is rung by telegraph. The Board room is lighted by a large skylight above, and by a large and four smaller windows on the eastern and western sides.

The ground upon which the new building stands cost \$193,000, and \$450,000 have already been expended upon the building itself, making the total outlay something over \$640,000.

RECENT dispatches from Peru says Henry Meiggs has become financially embarrassed and unable to redeem the hills issued by the Public Works Company, of which he is President, and that in consequence of these difficulties work on some of the railroads in that country is likely to be temporarily, if not permanently suspended.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Two Days in the High Sierra with Hooker and Gray.

[Written for the Press by J. G. LEMMON.]

"We have accepted an invitation from Gen. Bidwell to be taken to ascend Shasta. Sir Joseph's time is so limited that we cannot make you that long-promised visit at Webber lake, but we must have at least a day with you. Come over to Truckee and go with us to Tahoe," wrote Dr. Gray, from the Palace hotel, San Francisco.

My warning was short and preparations consequently brief. Almost at the last moment my aged mother bethought herself of this chance to visit some dear friends on the farther side of Tahoe; so, conveniences for her comfort were added to those already composing the equipment of the little botanical wagon, and soon we were gliding up and over the cool mountains beneath the grand old pitch and sugar pines and the white and red firs—not only the great wealth of the Pacific States, surpassing their precious metals, but the wonder, delight and envy of foreigners.

By 6 P. M. we had crossed, in succession, the Little Truckee, Sardine, Russell, and Prosser Creek valleys, with their intervening ridges, and had entered upon a cold elevated plateau, denuded of trees, telling that the noted lumber-producing region of Truckee was near.

At midnight of September 11th, 1877, the long, overland train emerged from the lofty summit tunnels of the C. P. R. R., and thundered down by the Truckee hotel. By the use of the telegraph we had learned that the great scientists, joined by Dr. Harkness at Sacramento, were surely on this train.

"Is that you, Lemmon?" shouted Dr. H., from the platform.

"Yes," I replied; "and, judging from the gray beard, this must be Dr. Gray, the father of American botanists," I added, approaching a small, quick-motioned, keen-looking man hastening towards us.

"Yes, yes," said a quick voice, accompanying a swift grasp of the hand, "the grandfather of them."

And thus commenced one of the most informal and oddest of greetings. The tall form of Sir Joseph soon appeared descending the steps, and, as became his noble bearing, Dr. H. announced him to the company with due ceremony.

Dr. H. had already planned the next day's excursion.

A special train drew out of the depot at the early hour of 6½ A. M., bearing Sir Joseph Hooker, Sir David Wedderburn (also an eminent English traveler and scientist), Dr. Asa Gray, Dr. W. H. Harkness and the writer (leaving Mrs. Gray at the hotel to rest), all bound for the summit station, where we found that six inches of snow had fallen the previous night. The sun was swiftly clearing it off the corrugated face of Mt. Stanford (until lately called Castle peak) our objective point, six miles to the north; and while he continued his welcome labor we partook of breakfast with a gusto, born of the long delay and the keen atmosphere.

#### Climbing Mount Stanford.

Preparing for the ascent, the Englishmen seemed only to take a deep inspiration; Dr. Gray hardly stopped for that; Dr. Harkness laid aside a wrapper, while the writer took off his overcoat and seized a stout, long stick for an alpenstock. Mr. Hill, the host at the Summit house, kindly acted as guide for the first and most obscure part of the way. The writer was held responsible as supplementary guide, and was at once installed as prompter to the botanists, since the flora was familiar to him.

"Is this *Wyethia angustifolia*?" called Dr. Gray, snatching up the first plant met with.

"No, it is *Helianthella Californica*," I gleefully replied, making the most of this, my first triumph, won, of course, by the paucity of the specimen and the brevity of Dr. Gray's glance.

The keen eyes of the little chief soon became accustomed to the new scenes, and not a plant, however small, or withered, or secreted by rock-cleft or chapparal, escaped his scrutiny. Sir Joseph Hooker began at once the examination of the trees. He is especially interested in noting correspondence between trees of different regions, and often pointed out resemblances to trees of New England, and of European forests. There are several knotty questions about our conifers which these masters in botanical science mean to settle, upon their return home and the comparison of their notes, taken industriously at every point where they have visited our forests during their extended tour.

This is the last stop they make; going from here to Davenport, Iowa, to confer with Dr. Perry, then to St. Louis to see Dr. Engelmann, with whom they expect a sharp engagement, the latter being a very keen observer, an extensive traveler, and making the forest trees of the United States his especial hobby.

#### Questions About Our Trees.

One of the questions is in regard to whether

our common white fir is identical with that first named by Douglas *Abies grandis*, and found on the cascades of the Columbia. Our California species Engelmann calls *A. concolor*. Our other balsam, the most beautiful and majestic tree in the State, is in jeopardy also. It is the rare and symmetrical-limbed, red-barked or silver fir, of high plateau, heretofore called by Douglas' name, *Picea amabilis*, but declared by Engelmann to be distinct, and named by him *Abies magnifica*. The reader will notice that the generic name is changed by Dr. E. also. There is a long tale to this subject. The two woods, *Abies* and *Picea*, are much controverted, and often applied by the leading authorities to the firs and spruces interchangeably. Of late years *Picea* has been dropped entirely, and the entire section of spruces with depending, persistent-scaled cones was united with the firs having upright, separating cones, and called *Abies*. But Dr. E., with great courage, and, as it seems to the writer, wisdom also, divides the family again, and restores the old name of *Picea*, but applies it to the spruces, leaving *Abies* for the firs, in accordance with Pliny and the older botanists.

The several forms of the cones are of particular interest, and, it seems, specimens are meager in Eastern collections. In the recent ascent of Shasta by these great botanists, they met with John Muir and Mr. Sisson, both keen observers, who declared that the cones of *Abies concolor* (Engel.) often show exserted bracts between the scales, a form never seen by the writer, who is familiar with the Sierras from Yosemite to Lassen. Should any reader meet with cones of the white fir, bearing upright apple-green cones about the size of turkey eggs, and having exserted three-parted bracts, they will confer a great favor by sending a cone, or all its scales, seeds, bracts, etc., loosely inclosed in a paper sack, to Dr. George Engelmann, 3003 Locust street, St. Louis.

The diverse forms of *Pinus ponderosa*, our common lumber pine, engaged particular attention. It has large and small cones, bright green and also blue-glaucous colored leaves; also great diversities of bark, wood, arrangement of leaves, etc. I once found a tree in Butterfly valley with all its leaves in fascicles of fives instead of threes, the normal number. Lumbermen recognize at least five kinds of this tree, and give it as many names. Our black spruce, *Picea Douglasii*, having exserted bract cones here about the size of a hen's egg, has them in the San Bernardino mountains four to nine inches long, almost establishing a distinct species there.

The junipers, too, are in limbo, and a gnarly old tree half way up Mt. Stanford yielded a host of specimens of wood, bark, eccentric growths, excrescences, sand-worm ridges, etc., which, with the assistance of a big knife, Sir Joseph transferred to his capacious pockets. The oaks of California were in a bad mood, until Dr. Engelmann lately cleared them up.

Dr. Harkness, with microscopic eyes, called frequent attention to various fungi on the herbage, and discoursed enthusiastically and learnedly upon them during breathing spells. The Doctor cannot fail of being of great use eventually, in his detection and study of the blights, blasts, molds, etc., which infest our vegetables. It is a very obscure subject, requiring the deepest study, the choicest instruments, and, withal, the utmost abstraction and patience. As Sir Joseph remarked to me, "Who, but Dr. Harkness, in all your State, would do it?"

Near the base of the final, nearly treeless turret-crowned shaft, Dr. H. and myself halted, kindled a pitch tree, took off our boots to wring out our stockings, and laid down on the rocks to rest and discuss the merits of our distinguished guests. The guide, Mr. Hill, had returned long before; Sir David had long since disappeared, too, but in the opposite direction, up the bald cliffs. Sir Joseph and Dr. Gray, leaving their collections with us, hastened on up the steep, pausing often, we could see, to examine a plant together, or to crowd bits of herbage into their long portfolios, their constant companions. Splendid, tireless, compact-brained men! Description is impossible. An attempt would be but a caricature.

On their return, two hours after, with Sir David, they reported great satisfaction with the flora—though past its season—and with the extended view from the top.

I had requested them particularly to note the appearance of the valley of Webber lake, and both declared that the view but increased their regret that time did not admit of their visit there, as all along promised and expected. An extra side excursion to Shasta took its place, and now they must hasten home. Dr. Gray also regretted not finding *Ranunculus corymbosus* and *Astragalus Austine*, both perished out of sight; but he obtained a desirable form of *Lauscheria Cal.*, now lost from the gardens East, and also several rare plants, including, perhaps, a new *Erigeron*.

Winding down amidst the rocks and groves, and over intervening ridges, Sir David became separated from the party; but as such casualties were expected, no concern was felt for him, and when we slid down to Truckee at night on the train, we were not surprised to find that the lost tourist had beaten us home by an hour, and that the grand ascent of the historic Mt. Stanford by the Hooker-Gray party was an old story.

#### Trip to Tahoe.

The second day's programme involved simply a pleasure trip to Tahoe, whirling along up the Truckee, its outlet, in a fast stage to its beach, then gliding silently over its blue waters—hence affording but little to tempt a mere botanist's

pen. Botanists endure stage-coaches because they can often get Jehu to put on the brake—as, erst, ours did with great promptness, when requested; but rail-cars are an abomination, and steamboats an unmixed evil. Nevertheless, on the cool deck of Captain Avery's steamer, when out in the deep, mysteriously blue sea, after the great savans had distinguished their last flower, the butter-weed of the shoaly water, and their last tree of the fading forest; after they had critically and briefly noted all the phases of scenery and drawn comparisons with that of Scotland and Switzerland, they sat down on the forward deck and entered into a familiar, easy chat, too personal to relate, but too charming and instructive ever to forget.

Arrived at Glenbrook, the botanists hastened away for an hour's run over the near hills, gathering cones, twigs, flowers, lichens, etc., enough to employ all our hands, including those of Mrs. Dr. Gray, who is no whit behind the Doctor in the use of the proper botanical words, and often accompanies him on short, easy excursions like this. When asked if she was not tired of our everlasting evergreen mountains, "Oh, no!" she exclaimed, "your *Pinus ponderosa* is so splendid and your *Abies amabilis* is just magnificent, as Dr. Engelmann describes it by his name."

The varieties of *Pinus ponderosa* found near Glenbrook were even more numerous and more distinctly defined than elsewhere met with: Dr. Gray visited a lumber factory and secured specimens of bark characteristic of this valuable tree. Trees were climbed for particular cones and limbs. Mrs. Dr. Gray's practical eye was put in frequent requisition to detect colors or decide between the disputing doctors—"green, blue, glaucous, shining," from her, ended all debate.

Sir David, glad to escape the narrow deck of the steamer, pushed over the hills, here and there, ending his brief exercise by scaling the Shakespeare rock, from which he reported a fine view of the lake. He left the party bere for the East via Carson and Virginia.

On our return to the hotel we found awaiting and visiting with my mother, the Hon. James A. Rigby and family, very cordial and intelligent persons, who, upon presentation to the great scientists, at once found themselves engaged, as by the eye of the ancient mariner; the rapid inquiries of the botanists being as speedily answered by Mr. Rigby, fully prepared for the ordeal by his large experience in lumbering. He bitterly regretted that he did not know of the contemplated visit of the Hooker-Gray party, so that he might have placed his own fine fast steamer at our service and accompanied us to points of interest—Emerald bay, Cornelian bay, Hot Springs, or Lehigh cove. As it was, he could only accompany us down to the steamer, call the Captain aside and order him to charge the expenses of the trip to him—the good, generous soul!

The return stage was halted but seldom, for time was short. A brief look was given to the pools of trout at the Corner fishery, a few rare plants were snatched from the hills and stuffed into portfolios. A new locality for *Rhamnus alnifolia*, abundant along the Truckee, was noted, and, just at sundown, the stage bore its dust-covered but pleasure-filled passengers to their hotel and supper.

Next ensued a most important and particular labor. A large, strong box was brought, placed in the hall before the doors of Hooker and Gray's rooms and opened. For an hour all hands were busied writing tickets, wrapping the fruits of late excursions in papers and packing properly in the box. All just finished in time for the eight o'clock express.

A breathing spell followed, coats were resumed and the usual quiet of rooms restored. Then followed a grand resume of the whole trip to California—expressions of entire satisfaction with its scenes and its people, especial mention being made in this connection of this, their last two days' experience; ending, as the night waned, with a few last commissions, a final injunction, a hearty grasp of the hand, a kind good-bye; and the midnight overland train, thundering along in the darkness, bore away, as it had brought, the great, matchless scientists, communicative gentlemen and indefatigable workers—Hooker and Gray.

Sierra Valley, Cal., Sept. 18th, 1877.

#### Investments in Sierra County.

Capitalists are waking up to the advantages possessed by this county as a field for prospecting. Quite a number of San Francisco mining men are seeking a chance to invest their surplus cash and help to develop the hidden riches hereabouts. Several Virginia City men have also acquired interests in this neighborhood, and the prospects were never better. Almost every day we see or hear of some one who left here for Washoe, when that excitement was at its height, having returned to prospect some spot that he thought well of in days gone by. The operations of the Pliocene company have probably done more to attract attention in San Francisco than any other one company. We are glad these men have discovered us. Our hills are full of gravel and quartz, and we only want the "open sesame" of all powerful capital to make this the richest county in California. A large number of favorable gravel locations can now be purchased or homed at moderate figures, and this section literally bristles with quartz ledges known to contain gold. When the Pliocene get down their shaft, locations on that ledge will be at a premium.

#### Eastern Nevada Mining Camps.

R. Hobart, of Virginia City, who has lately returned from a four weeks' trip among the mining towns and camps of eastern Nevada, gives the *Enterprise* the following account of some of the places he has visited:

##### Iron Monster.

At the Iron Monster mine, six miles northwest of West Gate station, be found Frank Maine and party bard at work sinking a shaft in the vein, which is 57 feet in width. They are now down something over 30 feet. They have already obtained ore that is rich enough to smelt, as it assays as high as from \$135 to \$140 per ton. The mountain in which the Iron Monster is situated is capped over with limestone. In this, wherever any little cropping out of quartz is discovered, by sinking a small shaft rich ore, similar to that in the main lead, is found. Ore has been found in this way in so many places on the east side of the mountain that some are of the opinion that all under the limestone is a solid mass of ore. This mountain is situated east of the old Silver Hill mining district and across a desert some miles in width. The owners of the Iron Monster vein intend putting up a furnace as soon as they are sure that they have enough rich ore to justify the outlay.

##### Lodi.

Is 35 miles south of West Gate, and the principal mine of the place is the Illinois, of which Uncle Billy Raymond, the locator of the Raymond & Ely mine, Eureka, is the principal owner. The ledge is only four or five feet in width, but is very rich. It is worked by smelting and pays from \$400 to \$700 per ton. It is in a limestone formation, with porphyry on one side. Mr. Raymond is now in California making arrangements for the erection of a furnace. There are about 200 men in the camp, which is quite a lively one.

##### Carbonate Point.

The Downey boys have a rich claim at Carbonate Point, five or six miles from Lodi. The point of the mountain where their mine is situated is capped over with limestone, and all below seems to be a mass of ore, as it is reached wherever they cut through the cap rock. The Downeys have shipped several tons of their ore to California, which paid them from \$400 to \$500 per ton.

##### Old Mammoth.

The old Mammoth district is at present pretty much deserted, though the owners of some of the mines are talking about resuming operations. The old mill of the district is running on tailings which are paying well. Mammoth district is about 10 miles southeast of Lodi.

##### Ione City.

Is quite a lively camp. The Storm King, owned by the Ural mill and mining company, is the leading mine of the place. They have been trying the leaching process in working their ores. The experiment cost them \$50,000, when they found it would not answer. They are now preparing to work their ores free. They are down on an incline some 400 or 500 feet, but not more than 200 feet perpendicularly. Their ores run about 12% in gold, and are rich in silver, paying about \$100 per ton. There are about 300 persons in the camp. Good prospects are being obtained in quite a number of mines in the place.

##### Tybo.

Is about 12 miles north of Hot creek, and the Two G is the principal mine. The vein is from four to seven feet in width. The owners of the mine are running two furnaces, in which they smelt 80 tons of ore every 24 hours. They are down about 400 feet and have proper hoisting works; also a sawmill for sawing lumber for use in their shaft. It is a lively little camp of 250 or 300 persons, all of whom are at work.

##### A Group of Camps.

At Belmont all the mills are at present idle. At Danville, 55 miles north of Belmont, a few men are at work on promising leads. The ores are such as must be roasted before milled or smelted. No one in the district has capital with which to properly open and work the mines.

All is rather quiet at Hot creek at present. At Rattlesnake canyon is a mine owned by Franklin & Donahue which assays as high as \$135 per ton, but the owners lack capital with which to work the mine.

At Jefferson canyon is a mine and mill with a roasting furnace. The mine yielded about \$1,500,000 when a fault was reached and work was suspended. It is supposed that the lead might be easily recovered should the mine be taken hold of by experienced miners.

AN IDEA IN REFRIGERATION.—Housekeepers who are troubled with moisture in their refrigerators will be glad to learn how it may be prevented. Fresh, unslacked lime, in small quantities, say a quart, placed in a refrigerator, will gradually absorb all the moisture in the provision chamber. The consequence will be a dry cold atmosphere, in which meat and other articles sensitive to the presence of moisture can be kept sweet for a long time. A little experience will soon enable one to know when to renew the lime and how much to use at a time.

## MECHANICAL PROGRESS.

### Making Picture Frame Ornaments.

The following instructions are given for molding the ornamental parts of picture frames, upon which the gilding is to be laid: Boil seven pounds of the best glue in seven half-pints of water; melt three pounds of white resin in three pints of linseed (raw) oil. When the ingredients are well boiled, put them into a large vessel, and simmer them for half an hour, stirring it, and taking care it does not boil over. When this is done, pour the mixture into a large quantity of whitening (previously sifted and rolled fine), and mix it to the consistency of dough, and it is ready for molding into the required shapes. The above compo will keep for a long time in a damp place, or in a barrel of whitening. Compo, when cold, is very hard, and is heated by means of steam, when it assumes the consistency of dough. The ornaments are made by pressing the compo into molds made of boxwood, the ornament being countersunk into the wood. The ornaments are got out as follows: Take the mold, and well brush into it oil and turpentine to prevent the composition adhering to it. Roll sufficient warm compo in the hands into a convenient form to go into the mold, press carefully into every part with the fingers, then take a piece of board with a flat surface, wet it, and place on the back of the mold, put under an iron screw press, and the pressure, which is but for a few moments (a vice would answer the purpose), drives the compo into all the deep parts of the mold; take out of the press, and remove mold. After the compo has hardened a little, the ornament is cut off, and the remaining compo sliced off, to be again heated and used. The ornament, when first cut off, is very soft and pliable, and can be fitted to frames having heads, hollows, etc., without fear of breaking. When dry they should be backed up—that is, the spaces between the corner and frame filled up with compo softened in hot water, which will make the ornament thicker and stronger than before.

**ENGLISH BUSINESS REVIVING.**—Thus the *Colliery Guardian* jubilates: "Orders in the past fortnight have come in thick and threefold," was the cheery remark only a day or two ago of the principal of a great iron-consuming concern in the Midlands. "We have received more orders in the past ten days," was the remark made at about the same time by one of the largest hardware exporting merchants in this kingdom, "than we have received all the three months." More, it would be correct to write that there are hardware merchants in England who to-day are doing more business than at almost any similar time since the depression in trade began to appear some four years back. This is cheering. Too much for it is not claimed; but it is not disregarded in our survey of the "position," which, in a trade sense, is perceptibly improved. The whole home trade is better, and our export business is steadily expanding.

**HEATING TOWNS BY STEAM.**—According to the *Age of Steel*, the initial attempt at warming a village by steam at Lockport, N. Y., is a success. The cost is thought to be but little more than half the cost of stoves, although the great heat for kitchen apparatus may be less easy to furnish. From the steam boilers the supply of heat is forced through pipes laid under the ground to the buildings which are to be warmed. The main pipe, constructed of iron, is in size about five inches in diameter. Around the pipe is wound hair-cloth one-half to three-quarters of an inch in thickness, and over this is wrapped heavy Manila paper. Thus prepared the pipes are laid in hollow logs, which are covered with zinc.

**NOTE ON HOT JOURNALS.**—Chas. Beurgan writes to the *Railroad Gazette* concerning hot boxes. His suggestion is that when a journal gets hot it is cooled with water, and as the water cannot be applied to the top the lower part is cooled much more rapidly, thus to a certain extent hardening that side. In subsequent wear the journal becomes more or less oval, and as a consequence "runs hot" until taken out. I have been assured that in one case when the calipers were applied there was as much as one-sixteenth inch difference in diameters of some journals, and after being turned down they ran 800-mile trips as cool as any journals ever did.

**FAST RUN.**—Probably the fastest run for any considerable distance ever made on a railway in America, says the *Railway Age*, was that achieved on the Canada Southern road one day last week, when the distance between St. Thomas and Amherstburg, Can., 111 miles, was covered in 109 minutes. It is said that one mile was made in 54 seconds, which would be at the rate of 70 miles an hour—a speed that has been attained in England, though probably not for years.

**INDUSTRIAL ARTS EXHIBITION AT LEIPZIG.**—Efforts are being made to open in Leipzig, in the course of 1878, an exhibition of the latest products of the industrial skill of Germany, which it is intended should serve as an index to its deficiencies, and to the methods by which they may be overcome, so as to give German manufacturers a better place in the market of the world.

**TRACK-LAYING MACHINE.**—The *Railway Age* has been shown the drawings of an invention of D. S. Moore, of Chicago. It is called a track-laying machine, and consists in a succession of rollers set in movable frames attached at will to the sides of several flat cars in a train, "elevated" so as to afford an inclined plane from rear to front. Upon these the ties on one side and the rails on the other, are easily rolled or laid by men upon the cars, when they move along over the rollers to the front, and are delivered to the tie and track layers as fast as they can use them. The object of the device is to obviate the use of teams in distributing ties along the road bed, especially over rough or swampy ground, and to save extra handling of the iron, as by the present way. The machine was tried recently on the Brainerd cut-off of the Northern Pacific road, and was highly approved by the contractor, Col. De Graff, General Rosser and others. This inventor claims that he can tie and iron a road with this appliance for from \$25 to \$50 per mile less than by the old method. It will dispense with many of the teams and hands now required, and enable the work to be done very rapidly.

**MAKING GLASS EYES.**—The processes are singularly simple, though, in some instances requiring great manipulative skill. The workman is provided with a number of thin glass rods, of the colors required. Heating the end of one of them by means of a blowpipe, he "gathers" from it sufficient for his purpose, on the end of a wire. This first gathering is generally of white or colorless glass, to form the white of the eye. He then takes the rod required to form the iris, and "gathers" from it on the white; and, lastly, a little spot from a black rod is added to form the pupil. During the process the "gathering" on the end of the wire is rotated in the flame of the blowpipe and occasionally pressed against a smooth surface to obtain perfect evenness of outline. In spite of the skill required in the manufacture and a considerable demand for the article, glass eyes are now greatly reduced in price, and the rate of wages of a few work people is very low.

**CURRENT FASHIONS IN JEWELRY.**—Silver jewelry has been and continues quite the rage in England, and the ear-rings made in this metal are certainly more artistic than their golden brethren, which seldom include the delightfully graceful and becoming "tassel" ear-rings, of which there are so many various patterns in silver. The lighter the workmanship of silver, the more becoming are the ornaments. Very pretty designs are daisies looped together by the stalks, a necklet of looped silver daisies to match, with pendant of one large marguerite; or silver fuchsia bells, with necklet of fuchsia leaves, and pendant of two or three blossoms. Filigree jewelry in gold and silver, is becoming fashionable again; but, though inexpensive, it so easily gets broken or discolored that it can scarcely be considered good value.

**NEW STEAM DREDGING MACHINE.**—A novel form of steam dredger was launched recently on the Thames, in which advantage is taken of the law of the equilibrium of fluids. In the side of the vessel, as far below the water-line as possible, a hole is made, to which a flexible pipe, carrying a nozzle of peculiar construction, is attached. The pipe is long enough to reach the bottom, and a current of water is caused to flow by the difference in level. This carries with it anything in the shape of mud or stones that will pass the nozzle, and when it reaches the hold of the dredger it is there driven out by a centrifugal pump into barges. The dredging is thus continuous.

**NEW ANTI-CORROSION FOR BOILERS.**—Bohlig, of Eisenach, prepares magnesia for the purpose of combining with the mineral salts usually found in the feed-water of boilers, and precipitating them without doing hurt to the boiler-plate. The preparation is said to separate the bicarbonates of calcium, magnesium and iron, precipitating at the ordinary temperatures, aluminates, silicates and similar bodies present in water. The water is mixed with the preparation before feeding, and fed direct into the boiler.

**A SELF-EXTINGUISHING FIRE.**—There is an invention shown at Omaha, the design of which is to put out the fire in a stove, in case the stove is wholly or partially upset, as in a railway accident. This is accomplished by surrounding the stove with a jacket containing water. Openings in the jacket communicate with the interior of the stove, so that if the ear is much tilted from a level, the water will flow into the stove and extinguish the fire.

**SEPARATION OF IRON ORE BY MAGNETISM.**—Mr. King of the Ballycorkish mines, Isle of Man, crushes his ore, which is composed of galena, blende, and sphatose iron ore, and after separating the galena, roasts the residue to a dull red heat in revolving retorts, thus producing a magnetic oxide of iron by decomposing the carbonate of that metal. The ore is then put into drum wheels having magnets arranged radially within; here the magnetic ore is separated by attraction and the blende left to escape clear.

## SCIENTIFIC PROGRESS.

### United Effort for Science.

One of the topics brought to the attention of the recent meeting of the American Association for the Advancement of Science was a plea that all nations should plan together about the work which they would each undertake, so that effort need not be wasted in any direction. This idea found enthusiastic championship in Professor Grote, who brought it forward. We propose to cite a few of the points which he made:

The existing national associations in this country and in Europe are performing excellent work, but there are questions to the answering of which their means are inadequate. Foremost among these is that of the origin of our species. Indispensable to a correct habit of thought is the solution of this question, and its elucidation must be sought for in regions outside of those inhabited by the more civilized nations. The various scientific explorations in Africa, Australia, and the polar regions need co-operative assistance to realize the best results from the outlays, while the new knowledge they bring is the common inheritance of all reading peoples. Justice, then, would require that where all participate all should contribute. The plan of the international scientific service here provisionally proposed embraces the appointment of commissioners by the civil governments of the world, whose deliberations would be the wisdom of the age, and whose recommendations would be respected by the legislative powers of the consenting and represented nations. Under their auspices all extra-limital astronomical, geographical and biological expeditions would be fitted out and directed to those places which would be more fruitful for the particular purpose. No longer would we be subjected to failures arising directly or indirectly from national prejudices. The difference in the mental faculties between different nations would prevent the loss in such a body of any possible suggestion the human intellect could afford.

From an economical point of view the outlay of the different governments for scientific expeditions would be lessened, and more effective work would be done. The amount to be contributed would be less, because the expenses of any expedition to be decided upon by the service would be made up by a quota from all the governments represented.

When science takes hold of the brotherhood of nations, and calls upon them to undertake the solution of vital problems for the common good, there must surely be a glorious response. Of the existing sympathy between nations we have many ready proofs: The Austrian polar expedition is rescued by "foreigners," and America returns to England the ship she lost in Northern ice. The flag of the International Scientific Service should be made neutral by treaty, and would be held sacred by all.

Professor Grote closed with the following proposition: As tending to break down social prejudice, as working in a direction toward both greater economy and greater result, I venture to lay the proposition before this association that it memorialize Congress to appoint commissioners on the part of the United States, who would inaugurate the formation of such an international scientific organization, and, by resolutions to be passed by this association, invite a similar action on the part of kindred scientific bodies in other lands as would influence their respective governments to assist in the enterprise. It seems to me that some such step as I now speak of will eventually be taken. If the plan proposed he now acted upon, it will be at least a fitting thing that it was commenced by a country that protects the alien, and allows liberty to all its inhabitants to pursue their happiness. And it would be well for America to move in any matter that will create an active sympathy between the nations in scientific matters.

### Another Electric Candle.

According to the *Telegraphic Journal*, M. Plante has called attention in the French Academy to the bright light obtained when an electrode of one of his secondary batteries (a powerful one) is applied to a glass tube or wall of glass vessel containing a saline solution. With the positive pole a stronger force is required; but the light is more silent than with the negative, which produces some crackling. When the light appears an abundant white vapor is given off, having a slight alkaline reaction. The glass is strongly attacked and de-verified. It might be thought that the brightness was due to lime combined in the silicon; but in the spectrum there are no appreciable lines except some traces of that of sodium; whereas a piece of lime spar, under the same conditions, gives distinctly the lines of calcium along with a continuous spectrum. The lines of silicon do not appear, being weak, and the spectrum being intensely luminous, just as the carbon lines are not perceptible in the spectrum from the voltaic arc. The silicic origin of the light is still further proved by the fact that it is obtained, likewise, on contact of the electrode with pure silicon in the state of crystal of hyaline quartz. M. Plante proposes to distinguish this kind of light as the *electro-silicic* light.

### Prehistoric Monsters.

Prof. Cope has recently described, under the name of *Camarasaurus supremus*, a saurian which appears to have been larger than any land animal yet known. The New York *Independent* says: It is represented by a larger part of the skeleton, which was dug from a bed of the Dakota epoch of the Cretaceous period, at a locality near to Canyon City, Colorado. It was discovered by Mr. O. W. Lucas, Superintendent of the public schools of that county. Its thigh bone measures more than six feet in length, and the expanse of some of the vertebrae is three and one-half feet. The vertebrae are of very light construction, their bodies being mere shells surmounting large hollow chambers. A neck vertebra is 20 inches long, giving at least 10 feet for the entire neck. The body must have been 10 or 12 feet in length. The specimen is very complete, Mr. Lucas having taken great pains to secure its preservation. A somewhat similar specimen was recently sent to the museum of Yale college, but this one is larger and in better preservation. Prof. Cope has also recently called attention to a number of teeth of a huge land saurian, which evidently inhabited Pennsylvania at an early geological period. The specimens were found by Charles M. Wheatley, of Phenixville, Pa., in one of the copper mines, in the red sandstone and shale which traverses the State from northeast to southwest, in the eastern section. This reptile, which is new to science, was probably 30 feet in length, with a bulky body, supported by heavy limbs. The teeth are double-edged and firmly serrate and of the kind characteristic of the carnivorous saurians. The reptile was, doubtless, one of the most formidable that ever inhabited the State, and, in point of time, the earliest. It has received the appropriate jaw-breaking name of *Pulocotonus Appalachianus*. What appeared to be a large bone of a similar animal was discovered not long ago in a sandstone quarry in Newport, N. J., but has not yet been described.

**IRON AND GLUE IN STREET DUST.**—In this country we have assays of street dust yielding gold in some towns, but glue and iron we have not searched for. We read in exchanges that Signor Parnetti has been engaged in analyzing the dust and debris of the streets of Florence and Paris. His investigation of the debris of the horse paths proves that the dust contains 35% of iron, given by the shoes of the horses to the stones. In the dust from the causeways this eminent chemist finds from 30% to 40% of good glue. Signor Parnetti selected and treated separately the dust from the causeways of the Boulevard des Capucines over a period of two months, which uniformly gave 30% of good transparent glue, it is said quite equal to Belfast. This eminent chemist is now engaged in the analysis of the dust and debris deposited by the shoe abrasions in Lombard street, Cornhill, Cheapside, and other thoroughfares of London, and has it in contemplation to place his discoveries at the disposal of a limited company, with the view of establishing blast furnaces on the banks of the Thames to recover the iron thus lost, and a large glue works, which, it is thought, will produce more glue from the wasted material than will supply all London for every purpose.

**GALLIUM.**—The new metal, gallium, discovered two years ago by M. Lecoq de Boisbaudran, is so slightly diffused that the discoverer had to employ half a ton of zinc from the Pierrefitte mine to get 12 grains of metallic gallium. It resembles pewter in color, is not so soft as lead, but can be bent and cut. When heated to redness, it assumes a slight tarnish, without being reduced to an oxide. It is very fusible, melting with the heat of the hand, forming a white globule, and would form a mirror, like mercury, if pressed between two glass plates. Though melting at a temperature of 86° F., it does not solidify again until considerably below that temperature. It is one of the lighter metals, having a specific gravity of 4.7. Some years ago, Mendeleeff, of St. Petersburg, made a study of the atomic weight of the elements, and arranged them in such groups that he thought he could predict the future discovery of elements. To one of these, situated between aluminium and indium, he assigned an atomic weight of 68; but whether gallium corresponds to the hypothetical element in this respect does not seem to be well determined.

**PURIFYING IRON WITH CHLORINE.**—William Baker, of Sheffield, England, has invented a process of eliminating phosphorus from molten cast-iron, which consists in the employment of chlorine, which, by being injected into or by being brought into contact with the molten cast-iron, effects the separation in part, or practically entirely, of the phosphorus from the impure cast-iron. In carrying out this invention, he injects or passes into or brings into contact with the fluid molten cast-iron, chlorine in a gaseous form, and he prefers to submit the molten cast-iron to the action of chlorine before it has been subjected to the action of air, as, for example, in the Bessemer process or in the ordinary puddling process, or to other decarburizing processes. Although he has mentioned the employment of chlorine-gas, chlorine, in conjunction with other gases, may be employed; but he prefers to employ chlorine.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**MONTICLARE.**—Amador Ledger, Sept. 29. A contract for sinking an additional 100 feet was let Saturday, the work to be commenced forthwith. When completed, this will make a total depth of 250 feet. If the ore body is found to hold out at this depth, we understand the company will feel justified in erecting a small mill. The shareholders are a little scared about involving themselves in much expense in operating the claim. The mine is of the main belt, and croakers have continually prophesied that the ore would peter out. If, however, as the depth of the vein, the ledge remains intact in size and richness, there will be enough ore in sight to warrant the putting up of a mill.

**MAHONEY.**—The case involving the management of the Mahoney will not come up in the United States Court until January. In the meantime the mine is at a standstill, to the great detriment of Silver Creek. The mine is in the hands of the Mahoney, who is being developed. Doyle is talking about putting up an assayer to crush some of the richest ore he has taken out.

**VOLCANO ITEMS.**—Our quartz interests are generally improving. J. Orlbach is making another crushing of 120 tons at the Mace mill. It is averaging \$50 per ton. At the Downs mine they are still sinking with good prospects. Rodgers & Ely have struck a rich body of ore in the lower part of the claim, in what is known as the Gantler mine. The confidence has suspended work, pending settlement of title. I understand that the Golden Gate will start as soon as the water can be had to run the machinery. J. B. Pine is taking out fair ore over on the river. The Rising Sun company are waiting for water. The last crushing didn't pay. I am told by an old mill man that they did not understand assaying, consequently lost both gold and quicksilver. There are some parties in town at present from the Jo Davis mine, situated four miles southeast of Cable's ranch, on the other side of the Carson spur, who state that they have prospected six ledges in that vicinity, and the rock will average \$50 per ton, some assaying as high as \$1,700 per ton. They have a townsite surveyed, an inexhaustible supply of water and mill race, and plenty of timber. One would think there is a chance for a lively camp there next season.

**PLYMOUTH.**—The Phoenix race from the mill is finished, and men are now raising the sides of the flume above the mill, so as to secure more motive power. Sinking in the two shafts is completed, and drifting on the lower level has commenced. Large quantities of ore are being taken out before the mill starts, so as to keep 80 stamps running the whole season.

**MR. DAVIS.** one of our enterprising capitalists, has purchased the 10-stamp mill of Wheeler & Tregloan, and intends to put it up on a mine north of Dry creek, on the line of the Phoenix lode.

**CANONS OF MEN** are at work on the line of the ditch. The tunnel three miles north of town is being timbered and planked, and will be finished this week. For two months past men have been blasting a channel in the middle fork of the Cosumnes, to enable the company to float timber down the river next season to the head of the ditch. All kind of work connected with the Phoenix is pushed with vigor. At no time has the management of the mine been more efficient or energetic than now.

### BUTTE.

**BEAUTIFUL GOLD.**—Oroville Mercury, Sept. 29. Mr. and Mrs. Rhoades, of Magalia, arrived in town a few days ago and put up at the Chico hotel. While there, Mr. Rhoades showed some of the gold he had taken from his claim within the past six weeks sided only by his wife. A large number of hands of gold nuggets is a rare thing to see, but the lady and gentleman had that and more too. The pieces would weigh from \$1 to \$165. They have averaged \$125 a day during the time they have been at work.

### CALAVERAS.

**RICH ROCK.**—Calaveras Citizen, Sept. 29. We were shown specimens of gold-bearing quartz, this week, from the Potter mine, situated near Mosquito. The gold was evenly distributed through the rock and makes very handsome specimens, and the beauty of the thing—to Mr. Potter—is that there is plenty more where that came from.

**LOOKS WELL.**—Work on the Thorpe mine progresses favorably and the rock looks exceedingly well. As soon as the wheel and additional battery of five stamps is finished, we shall expect a good return from this mine. If the parties who own this ledge had the means to erect suitable machinery upon it, they could coin money. There is no doubt of that fact.

### LAKE.

**QUICKSILVER.**—See, Sept. 29. The Mount Jackson quicksilver mine, near Cuernavaca, has been started up. Good pay is expected by the owners. The Redington mine shipped 646 flasks of quicksilver in August, making 72,369 pounds, or over 30 tons of liquid mercury.

### MERCED.

**TUR MIXES.**—Mariposa Gazette, Sept. 29. The mines about Hornitos are assuming shape and are worthy of more than a passing notice, for never since mining operations first began in this region did the prospect look so bright as at present being worked exhibit such symptoms and positive indications of success as they do at the present time. The Duncan mine, which, in former days, yielded a great amount of gold, is now being worked by Jerome B. Brown & Co., who have taken out within a short time \$3,000. Jean Martin is the owner of a rich quartz mine. He has taken therefrom, of late, in about two weeks' time, \$15,000. This, as we understand, was a rich pocket and did not require the use of a mill. He also had some rock crushed at the Oats mill, which yielded upwards of \$170 per ton. Davidson & McMillan recently commenced work on their mine near Indian gulch, and on the second day took out \$1,000. J. M. Ross has bought a new mill, which he intends to erect at his valuable mine, on the Bear Valley mountain. A. Campodonico is under full headway with his mine and mill, which promises success. Harbeck & Co., near Pool's ranch, have struck rich rock in their mine. Royal's mine, near Tuleto gulch, has turned out some very rich ore. The old Wilson mine is being opened with a good prospect. The Washington mine is making many improvements, which indicates prosperity. At Mormon Bar, the Mercer mine has been started up. This river claim pays from \$1,000 to \$1,500 per week.

### NEVADA.

**BIG GAZ MINE.**—Nevada Gazette, Sept. 29. What was formerly known as the Buckham ledge, located about two miles from Bear River, in the lower part of this county, has recently changed hands, and work has been commenced to open it. John Hirsch, Kelly & Co. are the present owners. Two shafts have been sunk upon it to a depth of 100 feet. The ledge at that depth averages from one to two feet in width, and the rock which has been taken out has paid \$25 per ton. A mill will soon be erected to crush the rock for the mine of the company and will also crush custom rock. There is an extensive belt of quartz in that vicinity, but as yet little work has been done upon it.

**PROVIDENCE.**—First-class fine milling ore continues to come from the 100-ft level of the Providence mine. The mill is being overhauled, self-feeders being put up to each battery, and other improvements made, so that as soon as water comes things can be rushed ahead.

**THE NEVADA.**—Super. Berry is driving ahead with his incline, and expects in about six weeks to be down far enough to open a new level. Water is so scarce that but

five stamps in the mill can be run, and then only part of the time. Before the another dry season comes a connection will be made with the engines in the hoisting works so that no delays will occur.

The ledge located out beyond Plety Hill, near the old Turner place, is again being worked. It is owned by J. H. Richards, W. H. Martin and the Cleave brothers. Twenty-seven tons of the rock, recently worked, yielded in the neighborhood of \$15 per ton. The company are unable to put up machinery, unless they can dispose of a portion of the claim.

George Smith's mine, near the Half-Mile House, continues to look splendidly. Stopping and drifting is going on on each side of the shaft. In the east drift, 250 feet from the shaft, the best chute of ore yet found in the mine has been struck. The ledge there is of good size and is liberally sprinkled with gold.

The New England is still turning out first-class ore from the lower level, where the ledge is from two to four feet in thickness. The hoisting works are in good running order and everything ready for pushing developments. The Crosby reduction works will soon be in operation near the New England, and will work all the ore from that mine.

The Gold Spring mining company, near the old Turner place, have taken up the abandoned shaft through the ledge, and they have been working, and are going over to the other side of the ridge and start a tunnel to tap the channel.

There is considerable prospecting going on again in this district. There are any number of undeveloped ledges in this vicinity that will pay amply wages for work upon them while being prospected, and some are wise enough to get out and go to work upon them.

The owners of the Blue Point Union Consolidated mining company, of Smartsville, have been engaged the past month in repairing the ditch which conveys water from Wolf creek, at a point near Forest Springs, to their mine. They found all the flumes in an advanced state of decay, and are putting new ones wherever needed. It required a large amount of money, and some had to be done. Wolf, Crosby has discovered a ledge near the new site of the Pioneer reduction works, on the Grass Valley road, and has put men upon it to test its value.

Work is progressing in the Watt Blue Cravel mine shaft near Moore's Flat, and it is expected to reach bed rock inside two months. All in that section of country are praying for the success of this mine, as it will assure that they are not working on a dud.

What is known as the Tully ledge, situated at Selby Flat, has been re-located by some miners and work is being done to open it up. It used to be considered a valuable ledge.

The ledge which runs parallel with the Nevada and Providence mines, on the west side, is again being worked and a quantity of ore is being taken out through a tunnel.

We understand the rock from the Murchie mine continues to look well, and the prospects are very flattering. **MACHINEAY GOLD.**—Nevada Transcript, Sept. 30. A short time ago Geo. G. Allan, of the Nevada foundry, purchased the machinery of the Union mine company, at Grass Valley. He has sold it to the Ploocene company, of Forest City, and it is being hauled to that place.

Whitely's team, Mr. Allan has also sold to the same company a 90-horse power steam engine. The Nevada foundry is now turning out a large amount of machinery for several mining companies in this and Sierra counties.

**THE RABBIT.**—We interviewed a gentleman yesterday who had recently visited North Bloomfield, Moore's Flat and other places on the ridge. From his observations we are enabled to give you some items of interest. The mining prospects never looked better than it does now at North Bloomfield and its immediate vicinity. New and very extensive mining enterprises are going on, and a large number of men are employed. If the Derbec and Watt companies strike the gravel they are going for, and there is scarcely a doubt about the matter, hundreds of men will be added to the number already employed.

Two companies are driving ahead with all possible dispatch. The North Bloomfield has sufficient water to work for three weeks longer, and then they will proceed to get everything in order for more extensive work by the time the rainy season sets in. At Moore's Flat there are only two sets of digging running, on account of the lack of water.

**LOWELL AND LABERY HILL.**—Grass Valley Union, Sept. 29. Mr. Byrnes, Jr. has just returned from the Planet mine in Lowell Hill district, and reports everything there to be in the most encouraging condition. The tunnel, which is the largest in the county, is in 334 feet, and is a nice piece of workmanship, being as true and straight as a rule. The contractors were somewhat annoyed by the smoke from their blast hanging too long, near the edge of the tunnel, and this had quite an ingenious party to discharge it. They put in six-inch pipe the whole length of the tunnel, and at the entrance put an elbow and ran the pipe up in the air, by a pine tree, about 50 feet high. They then built a stone furnace, with a pipe leading from the fire to the elbow and up the perpendicular pipe; a fire built in the furnace completed this work and caused a draft from the furnace, the smoke from the horizontal pipe, and the blast pipe, and the smoke from the furnace would pull a bonfire on her nest. No more smoke or bad air for the Planet boys. Mr. Byrnes thinks they will tap the gravel in about 700 feet, and if he is correct it will be seen that the work is almost half completed. He will have a survey made next week, which will determine exactly the distance to be made. The company's financial condition is such, we are glad to say, as to equal the completion of this Grass Valley enterprise, and we confidently believe that the Planet will prove to be one of the most valuable mines in the State.

**Wm. P. Dewey, Esq.,** of San Francisco, has purchased the Leary ground, which is within 1,800 feet of the Planet. This 1,800 feet front comprises the "Mud Spring Ranch mine," owned by F. T. Maguire, Esq., of Liberty Hill. Mr. Dewey has let a contract for this Grass Valley enterprise, and the completion of this bedrock tunnel to the gravel banks is already under way. Mr. Dewey has a splendid piece of ground, and in that it runs from Steep Hollow to Bear River he has a dead sure thing on the pay channel, and we expect good returns for him when he gets his tunnel in. Maguire's mine is very favorably situated, being between the Planet and Dewey's; the work on each of these prospects is being carried on with the same vigor, and the work of running out the Nevada Enterprise mine, on the same lead, at Remington hill, is yielding richer than ever, and is the boss of the district. The Swamp Angel has its dumps full to overflowing, but their water is temporarily stopped, so we could get no late items from them, further than they have not yet cut through the gravel deposit, although they penetrated it over 800 feet. That ridge will boom in another year.

### SAN BENITO.

**HERMANDEY VALLEY.**—Cor. Hollister Enterprise: First in order was the famous old Hollister mine. Thousands of dollars have been expended in the development of this property, but to-day it remains idle. A pity, as I think by judicious management the property would pay well. Next follows the mines south of it, the Nevada Enterprise, owned by Ross, Sanchez, Sargent and others. A small open cut on the ledge has produced about \$5,000. It is the intention of the company to resume work at an early day. The Cody mine shows finely. The furnace of four tons will, in a few days, be in running order, when about eight flasks per week will be taken out. A 10-ton perpetual furnace will soon be erected, when there will be work for 100 men or more.

### SANTA BARBARA.

**LOS PRIETOS.**—Santa Barbara Express, Sept. 29. The Los Prietos quicksilver mine has again been a fair way to make a good show. Mr. J. A. Shedd, who lately returned from thence, reports the furnace in working order and a large amount of ore ready for use. Condensation is to commence about the middle of the present week.

### SANTA CRUZ.

**QUIL LANDS.**—Santa Cruz Courier, Sept. 28. We learn that some San Francisco capitalists have taken an active interest in the oil discoveries in this county, and are joining in with those already at work there to develop the claims as fast as possible. It is said that the company

have leased still another large tract of land and are now busy erecting machinery.

### SIERRA.

**NORTH FORK.**—Mountain Messenger, Sept. 29. Wm. McDougal has been appointed Superintendent of the North Fork mining claims, at Forest City. The company are still running ahead for the channel.

**NORTH AMERICA.**—The North America mine, at Newark, has paid very well this year, considering the losses they met with by fire late last fall, and the disadvantages under which it placed the mine. The mine has paid up that loss and a dividend besides.

**JUSTICE.**—The Junetta company have commenced a tunnel in Wallace creek, below Gibson, for the purpose of opening a tract of mining ground known to be rich. The cut is finished and the tunnel just under cover. This is an important enterprise, as it will test a gravel range, and, if successful, will make things very lively at Gibsonville.

## Nevada.

### WASHOE.

**OVERMAN.**—Gold Hill News, Oct. 3. The main drift south, as well as the crosscut east at the 1400-ft level, develops nothing of interest as yet. The connection between the 1300 and 1200-ft levels was expected to be made to-day, and is probably completed. The connection between the Belcher air shaft and the 2000-ft level of the Crown Point has had the effect to cool off the 1400-ft level of the Caledonia considerably.

**TWIN PEAKS.**—Work is being actively resumed after a few months' rest. The water is all out, and as soon as possible steam hoisting works are to be erected at the new working shaft. The machinery is already engaged. A ledge 72 feet wide between the walls, and nearly 100 feet in length, is developed, some portions of which give low assays.

**SILVER HILL.**—During the past four days have been drifting north on the 950-ft level toward the Justice, and making about six feet a day. Less water is being encountered than before the mine was shut down. The water from the 650-ft level has been drained within 40 feet of the 800-ft level.

**JUSTICE.**—Daily yield, 400 tons from the regular producing sections. The south lateral drift, on the 1150-ft level is pushing ahead and showing fair milling ore. The drift south, on the 1000-ft level, shows some improvement, and the surface above this level continues in good ore. The winze below this level is in hard blasting work.

**SOUTH COMSTOCK.**—A. Caldwell, the newly-appointed Superintendent, arrived this morning and took charge of the mine to-day. He is to start work in the mine again as soon as he can get the steam hoisting works.

**BEST & BELCHER.**—Work not resumed at the 1500-ft level, but will be soon, as the air is improving. The connection with the Savage and Gould & Curry at the 1000-ft level is expected to be completed by the end of this week.

**BULLION.**—At the 1700-ft level the east cross-cut is being pushed ahead at a lively rate, with the face still in porphyry and quartz.

**SIERRA NEVADA.**—Main drift north at the 1250-ft level, to connect with the Utah mine, is making good, steady progress. At the 1750-ft level the drift south from the shaft is progressing well.

**GOULD & CURRY.**—Drifts both north and south at the 1000-ft level are making steady progress. The connection with the Savage will be completed in four or five days.

**CON. VIRGINIA.**—Daily yield, 550 tons of ore, from the regular producing sections, keeping all the mills running steadily, with a large surplus accumulating at each. The 1650-ft level continues to be the main source of revenue in this respect, and the ore breasts and stopes, especially the southward and westward, are constantly being extended in those directions. The main drift west from the C. & C. shaft at this level has a little less than 100 feet to run in order to connect with the main Cou. Virginia shaft, which is being sunk deeper for that purpose. The connection will be completed in about two months from now. The face of the drift is in low grade ore. At the 1750-ft level the main C. & C. drift west has not yet got through the porphyry into the west ore vein, but it is expected to at any time. On the 1550-ft level the principal work is confined to the enlargement and retimbering of the main air gallery southward. Boring upward with the diamond drill from this level to tap and draw off the body of water which presses upon the southeast slope of the 1400-ft level is being continued, and the drill hole is being enlarged. The 1400-ft level is yielding a large amount of excellent ore, and the breasts and stopes to the southward as well as upward are looking as well as could be wished. On the 1300-ft level also there are large reserves of good ore. A large amount of excellent ore comes from the 1200-ft level, and extensive deposits of it are being developed in the workings upward and eastward.

**CALIFORNIA.**—Daily yield, 630 tons, the most of which comes from the 1500 and 1000-ft levels. The main drift west from the C. & C. shaft, at the 1350-ft level (cross-cut No. 1) is 90 feet beyond the winze, and it has nearly passed through the porphyry horse into the west ore body. The north branch of this drift is in fair grade ore, and has 30 feet yet to run in order to reach and connect with winze No. 3, being sunk from the level above. On the 1000-ft level the drift is being advanced, and the fill floors south and west, are looking splendidly. The south drift from the bottom of winze No. 6 has completed connection with winze No. 5, giving good ventilation and better working facilities. The ore breasts and stopes on the 1550-ft level are looking and yielding finely. On the 1500-ft level the ore breasts are looking finely as usual. In all portions of this mine, the extensive operations are developing an apparently inexhaustible amount of ore, much more than can be handled and milled at present.

**YELLOW JACKET.**—On the 2200-ft level the main east drift is in 300 feet, paid in porphyry, with clay and quartz seams. The ground is dry and loose, requiring close and careful timbering. The drift has been turned more to the southward, so that its course is in the south. 60 feet has been gained directly for the new shaft. The distance from the face of the drift to where it will intersect the shaft, when it shall be sunk to that level, is 490 feet. The main drift south at this level is now in 313 feet. The face is principally in quartz of a somewhat soft, loose character. At the new working shaft the cage guides are all in, the dump completed and the sket in place ready for starting up.

**BELCHER.**—The south drift at the 1000-ft level is in 205 feet, paid in porphyry with streaks of quartz. This drift has been exceedingly hot, but since the connection was made between the air shaft and the Crown Point 2000-ft level it has been cooling off considerably. The prospecting operations at the south end of the 1000-ft level, including the running of a diamond drill 300 feet east, have amounted to nothing thus far. The air shaft, from its connection with the 2000-ft level of the Crown Point, has the effect to cool the matter of air circulation, which is a great advantage.

**JOE SCATES AND GEORGE DOUGLASS.**—The station at the 200-ft level has been thoroughly timbered, and a drift run 20 feet northward. The station will be used as a retreat for the miners during a blast, and for the storage of tools, etc. The water that had accumulated in the shaft below the station was lifted yesterday, and the work of sinking the main shaft resumed.

**NIAGARA.**—Work is resumed in this mine under the most favorable auspices. The shaft is down 530-ft, and at the lower level a very promising vein of quartz was already developed at the time work was suspended last winter, some streaks of which assayed as high as \$230 to the ton. The hoisting works are in excellent order.

**HALL & NORCROSS.** The pumps continue running steadily and well. The water rises and falls like regular tides. This peculiarity will be obviated when the Savage pump gets work and helps out.

**JULIA CON.**—The east drift from the winze at the 1800-ft level is being advanced at the rate of about four feet per day, face in porphyry of a considerably clayey nature. The main drift north at the same level continues all in

quartz, giving low assays, and is advancing at the rate of five feet per day.

**ALTA.**—Running three cross-cuts on the 1050-ft level, one being in nine feet of good ore. Expect to strike the ore body with another in two or three days, and with the third in eight or ten days.

**UTAH.**—North and south drifts on the 1150-ft level making satisfactory progress, with no particular change to note. The incline winze below this level is down below the 1350-ft level.

**CALEDONIA.**—Drifting north on the 1400 and 1500-ft levels progresses at the usual good rate. A strong flow of water from both levels is easily handled.

**SUTRO TUNNEL.** The face of the header continues in soft ledge porphyry, clay and streaks of quartz, which material works very disadvantageously and requires close and careful timbering. Advancement is necessarily slower at present than heretofore.

**OTHR.**—Work on the 1000-ft level is being advanced as usual in the south lateral drift, following the ore vein.

**SAYAGE.**—Good work is being done getting the pump rods and bolts in and the shaft properly straightened up, but considerable work in that line remains to be done before the pump can start working.

**ARRANGEMENTS.**—Arrangements are being made for cross-cutting at the 2000-ft level. The old upper levels continue to yield 10 or 12 tons of ore per day, giving average assays of from \$30 to \$40 per ton.

**MEXICAN.**—The north lateral drift on the 1000-ft level still continues in good-looking vein matter.

**UNION CON.**—Repairs on the 1300-ft level not yet completed. The Union and Mexican joint cross-cuts on the 1405-ft level are being pushed.

**EXCHICHER.**—The combination drift north at the 2000-ft level continues in soft ledge matter, requiring close and careful timbering.

**CHOLLAR POTOL.**—Daily yield, 75 tons; average assays, \$22.50 per ton. The main drift east toward the Combination shaft is driving ahead at the rate of six feet per day in hard blasting work.

**LEVITIAN.**—The new hoisting or gallow frame will be completed very shortly, when work in the mine will be resumed.

**SECOR.**—The very encouraging ore indications at the bottom of the shaft continue.

**WHEEL-FARRO.**—Work is resumed, getting the water out and starting to sink the shaft deeper.

## CHERRY CREEK DISTRICT.

**LIVELY.**—White Pine News, Sept. 29. From District Attorney Davis, just in from Cherry Creek, we learn that our neighboring camp is getting quite lively. The Star mine has started up the pumps, and in a few days the water will be all out and the work of extracting ore commenced. Parties are negotiating for the purchase of the Pacific and Mary Ann mines, and if they succeed another mill will be put in operation in a short time.

## HUMBOLDT DISTRICT.

**BYRON.**—Silver State, Sept. 29. We learn from A. L. Hurd that the Kunkel boys are steadily developing the Byron mine in Humboldt district. They are now sinking a shaft from the lower tunnel, and the ledge is represented as looking better than for some time past. The Byron is a gold bearing lead and has produced some of the richest specimens ever seen in this part of the country.

## HUNTER DISTRICT.

**PROSPECTS.**—White Pine News, Sept. 29. From Col. Coulter, who has just returned from a trip to Hunter, we learn that the prospects of that camp are very favorable. The new furnace, which is a new invention, will start up next Monday, and much interest is manifested by furnace men in the experiment. The Hunter company is a San Francisco incorporation. The town is growing in a healthy condition, having some 40 houses, many of them superior in construction and appearance to those of the average mining towns of the State.

## TUSCARORA DISTRICT.

**DE FREES.**—Cor. Old Hill News, Sept. 29. The De Frees has its main working shaft down 245 feet. The ore, though not very rich, is rapidly changing to the sulphuretted character, like that of the Grand Prize, which adjoins the De Frees. The same ledge, which is the main source of the Grand Prize comes from below the water line, and the De Frees company have every reason to expect the same very shortly. The ore now cutting into by the bottom of the shaft will mill over \$50 to the ton. A new level is now being opened from the 210-ft station under the most favorable auspices. The small four-stamp mill of the company is running steadily, and the water is being pumped out of the mine. The ore is being shipped from San Francisco. This mill will also be run by water power. When they get up their new mill, and get fairly at work with it crushing ore from the mine, it will be but a short time before dividends will commence coming from the De Frees.

The Grand Prize is getting along nicely, notwithstanding the little trouble occasioned by the burning of the building over their hoisting machinery, and they are now making considerable improvement in their surface works. The main building is being rebuilt considerably larger than the old one was, and in a very short time the Grand Prize will be yielding more and richer ore than ever. It is the chief of the Tuscaroras. Meanwhile both mills are kept steadily running on second-class ore, and the new furnaces is being urged to completion energetically.

The shaft of the Navajo is down 133 feet, and the drifts each way from it, following the ledge, are in the best of prospects. The new steam hoisting works are started up. In the venture they have a fine vein of choice milling ore, and are developing a valuable mine. The Grand Prize, Grand Central, Argents and other principal mines being developed are showing prospects of the most encouraging character.

## WHITE PINE DISTRICT.

**STAFFORD ORE.**—White Pine News, Sept. 29. We learn that the ore now being crushed by the Stafford company, at the Eberhardt mill, is yielding well—fully up to the expectation of its owners. Ore assaying 160 ounces up to 80 pounds per ton, which is far above the average mill, was taken from a King mining and smelting company have purchased the engine in the Treasure mill, and will use it in their new furnace. They have also purchased the frame house on Mill street, nearly opposite Mr. Karbstein's residence, and are having it torn down and hauled to the mine, where the lumber will be used in the erection of comfortable quarters for the workmen.

## Arizona.

**TURKEY CREEK.**—Arizona Enterprise, Sept. 22. Work, preparatory to the erection of the two-stamp mill in Turkey creek, has been steadily progressing. The mill site is located about 150 yards opposite the Kuro's station, and about half a mile from the Goodwin mine. The grade is continuously down from the mine to the mill, which will enable the owners to run cars if necessary. Kirwagans has the contract for doing the wood work in the mill, and James Mee, an old and reliable mill man, will superintend the erection of the machinery. The owners have taken the precaution to erect their structure in such a manner as to be able to increase it to a five-stamp mill, whenever circumstances will require it. With an engine of 25 horse power, they will merely have to add three stamps and a pan, to have a complete mill of a larger capacity. They expect to blow their whistle in about 40 days, and start on Goodwin ore.

At the Goodwin mine things are looking bright. Dave Neale is down 140 feet and in good ore. There are 100 tons of ore on the dump, ready for milling, that will assay \$100 without sorting.

**PURCHASED IT.**—Messrs. Hoffman and DeCrano, who have been here for some time past for the purpose of examining into the merits of the Tip Top mine, went to purchase the same, yesterday, and advised the owners that they would take the mine, the price for it being \$50,000. They also agreed to purchase the Cross-Cut for \$12,000 and

(Continued on page 220.)

### Placer County Gravel Channels.

In the last two issues of the Press we have published articles on the above subject, from correspondence of the Dutch Flat *Forum*, and continue the subject again in this issue, condensing the letter materially, however:

Having cleaned up the bed-rock of all mining news in the immediate neighborhood of Secret House, I will next take a tramp of six miles southeast to Canada Hill, the extreme limit of mining in our territory.

#### The Reid Claim.

During the two years that have elapsed since I was here, the owners have made great improvements. The old claim, now in over 1,700 feet, has been leased for some time to Chinamen, but as they were pretty conclusively caught at their old game of stealing, their contract was forfeited during my visit, and transferred on the same terms, \$40 out of every \$100, to Mr. Shipman, hitherto foreman of the Mao mine, at the Hogsback. The claim has paid well for some time back and promises to continue doing so. The reason for leaving the old claim, was to enable Mr. Reid to give his whole attention to the hydraulic rig he put up last season, which is both complete and effective in its arrangements. The head of Van Cleave canyon, the commencement of the claim, was very rich in early times; two brothers named Tushmen (one I believe is the present Sheriff of San Francisco), taking out 150 pounds of gold. The pipe was put on this old ground first, to make an opening that would command the center channel thoroughly, and, though shallow and with a short season, repaid more than half of the expense of fixing up, altogether about \$5,000. The gravel bank is now from 35 to 40 feet deep, pays from top to bottom, is free from refuse dirt, and washes easily. The water ditch is over two miles long, and will be run eventually to the head of the North Fork of the Middle Fork, when, with the reservoir already built, it will supply 500 inches a day for three months, about as long as piping can be continued this high in the mountains. The pipe is 600 feet long, with a pressure of 160 feet. This pipe commands the old diggings on the channel for over a mile, and will follow the drifting right along; but eventually, when the works are completed according to the present plan, two more pipes will be put down at other points on the claim. With an ordinary wet winter this year, the present pipe, it is estimated, will clear the expenses of the whole rig, including ditches and reservoir. If so, when the entire plan is completed, with free water, three pipes, good dirt, and admirable facilities for this process of mining, there will be but few superiors to this claim in the country.

#### Immediately below Mr. Reid comes the Buena Vista.

The property of a gentlemanly and hospitable company of Spaniards, who enjoy the entire confidence and respect of the community. So far this claim has proven very rich, over \$20,000 being taken out of a small piece of surface ground, ranging from two to 12 feet deep. The company are now running a new tunnel, at an expense of \$2,000, to tap the channel deeper, and otherwise increased their facilities for working.

#### A mile below Mr. Palmer's house, comes American Hill.

And with that I am through with the mines. This is an old location, very rich in early times, still being drifted, and in places yielding good pay. Its greater merit, however, lies in the vast extent of ground it contains piping, and its marvelous facilities for good working. It has a warm, southern, sunny site, that causes the snow to melt sooner than any where else in the neighborhood, thus giving a longer season for washing. The boulders are much decomposed, breaking easily with the sledge, and requiring no powder even for the largest. The pay gravel is 100 feet deep, and prospects all the way down from the surface. In early times, very heavy gold was found on the bed-rock; and to day, pieces weighing \$15, and \$8 are found, and were shown to me. It is estimated that the whole ground could be put under the pipe for about \$10,000, but allowing a large margin for freight and cost of iron for the pipe, the chief expense. I think that sum too large, and, we must add, as a set-off to that cost, that by purchasing the Palmer interest, the great desideratum of free water would be obtained to wash the whole property. I am sorry I must add another paragraph about the channel, but, without it, this letter would be incomplete. It is easy enough to see where the channel went to, but in our present state of information, it is difficult to say where it came from. Unquestionably it came from some where above the head of Big Secret canyon, intersected Manilla canyon, passed on to Palmers, thence down Brushy, through American hill, to the opposite divide near Last Chance. Standing on American hill this is all evident enough. But, I have other, and stronger reasons, for thus locating the course; and, the more these matters are intelligently discussed and understood, the more money, time, and labor is there saved in prospecting. It has hitherto been supposed, that this channel diverged from the head of Manilla canyon, and going into the mountains due northeast, formed the Canada Hill diggings. I never accepted this doctrine for a moment. Nature is very exacting in her decrees and requirements; in nature there must be, an ounce to weigh an ounce; there must be a why for every where-for all the time. Now, we may take it for granted, I believe, that the ocean, from all

time, occupied about the same position as it does at present; and, in consequence, the watershed of all pre-historic subsiding streams would have been the same southwest lead they have at present. To turn this particular stream therefore, off in the mountains to the northeast, would be contrary to the fundamental principles of natural law, and form an exception to the general rule that cannot be accepted. I think the Canada Hill ground deposit is simply a flat, or basin, that caught the first overthrow of the outbreak of the channel ending at the Nead claim, and not going, as supposed to the base of Bald mountain. Does not the character of the gravel and rock sustain this idea? Does not the part of the Nead claim paying less than the Buena Vista, and Reid above it, confirm the idea? But, on the west side of the Reid tunnel there is a new kind of gravel just opened, of a bluish white color quite different from that hitherto worked, and which exactly agrees with the gravel of Brushy canyon and American Hill, for I put a piece in my pocket and compared the two. I thought at the time, it would be useful in future examinations, and it proved so. These are the reasons, why I think the Reid tunnel will soon make a new development, compelling attention to a large piece of country at the head of Manilla canyon, which has heretofore, been overlooked, but which, in future, may prove very valuable.

### Australian Progress.

One cheerful and satisfactory feature in our iron trade statistics just at present is the substantial demand which prevails for British railway iron on Australian account. The Australians enjoy a happy immunity from the vexations and complications of European politics. They do not suffer, except, perhaps, in a very remote degree, from the dynastic ambition of Russia, or the effete despotism of the Ottoman Porte. Even the possession of the British Premiership by Lord Beaconsfield or Mr. Gladstone possesses only a comparatively languid interest for them, as they have long since practically outgrown the domination of the mother country, although they are still nominally dependent upon her. Then, the Australians are beginning, apart from all these considerations, to grow into communities of some intrinsic importance. Year by year, a certain stream of immigration sets in upon their shores; and the natural increase of population, through the excess of births over deaths, is by no means a matter to be overlooked. The wool trade of Australasia has attained such an importance that it may be said to have outgrown what Dr. Johnson would have termed even the "dreams of avarice." A quarter of century since we received somewhere about 50,000,000 lbs. of wool annually from the Australasian colonies. In the first seven months of this year the corresponding imports attained an aggregate of 249,586,782 lbs.; and it seems tolerably clear that for the whole of 1877 the imports will not be less than 300,000,000 lbs.

Under such happy circumstances and conditions as these it is not at all surprising that we should find the Australians very resolutely bent on the construction of the additional railways which they, not unnaturally, believe will very greatly increase their material prosperity. New South Wales, Victoria, Queensland, South Australia, and New Zealand, have all new railway-works on hand of more or less importance; and in Tasmania, and even in poor sluggish Western Australia, the iron horse is also getting steadily to work. It would not, so far as we are aware, serve any useful purpose to enter into minute details in illustration of these observations; but we may note the by no means unimportant fact that within the last few days the South Australian government has succeeded in placing another railway loan for £500,000, while the New Zealand government is credited with the intention of spending an additional £940,000 for railway extension purposes. The New Zealand government is naturally encouraged to adopt this bold and spirited policy by the fact that the net revenue of its railways, for the first half of this year, amounted to £80,000, while their estimated profits for the financial year ending June 30, 1878, are £170,000. All the railways—or nearly all the railways—of Australasia are in the hands of the various Australasian governments, and in every case they are beginning to yield respectable financial results, irrespective of the indirect benefits which they of course confer upon the various colonies. In New South Wales the return yielded by the government railways upon the capital devoted to their construction is, according to a recent official return, about £4 7s. 6d. per cent. per annum. In Victoria the return thus far yielded upon the capital devoted by the Colonial government to the work of railway construction is, we believe, not quite so much; but it is something similar, and as both New South Wales and Victoria can now negotiate four per cent. debentures at about par in the London market, any new railways which they may undertake are, practically, no burden to them. In South Australia, Queensland and New Zealand the solution of the railway problem is not quite such an easy matter. The revenue likely to be acquired is not quite so large, and the debentures of the three last named colonies are either not quite at par, or, to secure a ready sale, have to bear a slightly higher rate of interest. But still, even in South Australia, Queensland and New Zealand the current aspect of the railway question is decidedly encouraging, and, accordingly, we find that new lines are being projected energetically and liberally. One general

result of what is taking place at our antipodes in the matter of railway construction is that we are sending large quantities of railway iron to Australasia, and appear likely to continue to do so. In July our shipments in this direction amounted to 7,889 tons, while in the first seven months of this year they attained the goodly aggregate of 46,005 tons. Well may the British iron trade re-echo the antipodean watchword "Advance Australia."—*Colliery Guardian*.

### Minor Patents—Their Real Value.

The Commissioner of Patents, in his annual report for last year, makes the statement that fully two-thirds of the manufacturing interests of this country are based upon patents. The same report indicates that there are over 150,000 unexpired American patents. If we classify the people of this country into two grand divisions, those who are interested, either directly or indirectly, in patents, and those who are wholly independent of them, the number included in the former class will be found to be surprisingly large and not greatly inferior to that of the latter, even if not exceeding it. The fact is that, without estimating the influence which the condition of manufacturing industries exerts upon the general welfare, very many are unconsciously dependent, to a greater or less degree, upon the revenue or income derived from the development of trade protected by patents. The workingman, who does not always reflect upon cause and effect, but is contented with employment, is nevertheless as often indebted to an industry created and fostered by a patent as to the routine of labor which lies beyond the influence of any system of protection.

It is a matter of surprise to many how profits considerable enough to support and enrich so large a class can be derived from patents which seem to them to be of minor importance. They can perceive why the sewing machine, the telegraph, the revolver and patent devices of that kind yield princely incomes to the few who control them, but that there are yet fortunes in tin pans, meat cans, nails, sieves, and the numerous small and common articles which they are accustomed to see and handle daily, is beyond their comprehension.

While it is true that some minor inventions seem to exhaust all hope of further progress in the same direction, there remain many novel and important details of construction which practical and observing mechanics will discover and render serviceable. All prudent manufacturers are aware of the necessity of strict economy even in small matters, and of the expediency of gaining any legitimate advantage, however slight, in order to render a business profitable and permanent when opposed by energetic competition. The scraps from the shop must not only be hoarded, but they must not be sold until they are made into some useful forms; and the scraps from these also must not be swept away, but utilized until even the sweepings are barren of further treasures. Let some of those who may think lightly of such rigid economy compute the number of wagon-wheel tires, horse shoes and horse-shoe nails which may be restored from the dust of London pavements, or even from the streets of Chicago.

If strict economy is essential in these respects, it certainly ought to be also practiced in the first and intermediate steps in the process or art of making a manufactured product. If the making of a seam in a simple tin vessel can be avoided, an important step is gained at once. The article is then not only more durable, but more serviceable while it lasts, and an advantage is obtained which renders it more salable even at a greater price than before. A margin for competition is not only thus produced, but a considerable quantity of solder, rosin and horax is rendered unnecessary, and others are either carrying or using a greater stock of these materials than is needed. The figures opposite these familiar items in the expense account are smaller than formerly, and if the account of serviceable material sifted from the dust heap is not so great as before, it is because there is less there which is worth the saving; there is also less money passing the wrong way over the counter. We will not estimate the saving in soldering tools, heaters, charcoal and wages, nor in the diminished wear of machinery; in the saving in rents, fuel, gas and insurance, nor in the indirect advantage in the lessened chances of loss by fire and accident by reason of the ability to produce a given amount of finished goods in a shorter time than before. Accurate estimates in all these particulars might lead to a climax which would tax the credulity of many and cast suspicion upon the logic of our reasoning. Practical economists, however, will perceive more of truth than of sophistry in what we have thus far asserted.

If this wisdom, patience and skill is in time rewarded by a useful and practical discovery, what ought to be he done next? If you would rather be deemed generous than wise, surrender to a less intelligent, less prudent or less fortunate competitor. If he then underrates your kindness, carefully collect all the scraps and findings about your place and send them to him on your draw, with your compliments. He will probably receive all you give, and may, ere long, return you a specimen of your ingenuity marked "patented," and politely request you to allow him to monopolize the working of your invention. If he is moderate enough to appreciate your invention without patenting it, he may be contented to cut prices about the time you expected to increase them.

Fortunately our manufacturers, as a class, are neither sentimentally nor whimsically generous in matters of business. They do not stop to theorize, but study and embrace whatever is practical. They perceive the necessity of every fair advantage in business, and this is the true explanation of the reason why so many so-called minor patents form the basis of manufacturing industries. Many large establishments, heretofore flourishing and prosperous, but which have seriously felt the distress of the financial depression of recent years, have been kept from the verge of bankruptcy by reason of the protection afforded by patents which were formerly regarded as of minor importance, and many of these, instead of longer occupying subordinate positions, have become the chief source of reliance. If the strong boxes of many of our most successful manufacturers could be examined, there would be found therein numerous undeveloped patents quietly awaiting their season of usefulness, and also many which are humbly doing duty as tireless sentinels warding off encroachments and alarming even the remotest enemies.—*Western Manufacturer*.

### Deep Mining Shafts in Europe.

Twenty years ago the deepest mining shafts in the world reached only about 2,000 feet below the surface. The very deepest, we believe, was a metalliferous mine in Hanover, which has been carried down to a depth of 2,290 feet. The deepest perpendicular shaft to-day is the Adelbert shaft in a silver-lead mine in Prizibram, in Bohemia, which has reached a depth of 3,280 feet. The attainment of that depth was made the occasion of a three days festival, and still further noticed by striking off a large number of commemorative silver medals of the value of a florin each. There is no record of the beginning of work on this mine, although its written history goes back to 1527. Quite recently an elegant commemorative volume has been written and printed, which is most interesting to those who have a taste for either the actualities or antiquities of mining industry. There are two other localities, however, where a greater depth has been reached than at the Adelbert shaft, but not in a perpendicular line. These are: 1. The Rocksalt bore-hole, near Spersenberg, not far from Berlin, which, a few years ago, had been bored to a depth of 4,175 feet. 2. The coal mine of Viviers Remus, in Belgium, where the miners, by shaft-sinking, together with boring, have reached a total depth of 3,542 feet. Turning from these two mines, no shaft, in unbroken perpendicular line, has as yet exceeded the depth of 3,280 feet. Taking each singly, the deepest shafts in the world at the present moment, group themselves according to the following order:

1. The already mentioned Adelbert shaft, 3,280 feet deep. As the top of this shaft is 1,732 feet above the sea level, the bottom is, of course, 1,545 feet below it.
2. Two shafts near Gilly, in Belgium, are sunk to the depth of 2,847 feet. At this depth they were both connected by a horizontal drift, from there an exploring shaft is sunk to a further depth of 666 feet, and from there again a trial bore, 49 feet in depth, is put down, so that the total depth reached is 3,542 feet. As they did not, in the bore hole, discover the sought-for coal seam, they have returned to the shaft at the 2847-foot level.
3. The Eimgkerts shaft of the Lugauer coal mining company, Rhenania, Lugau, in the kingdom of Saxony, is 2,653 feet deep.
4. The Sampson shaft of the Oberhartz lead and silver mining works, near St. Andreasberg, Hanover, has a depth of 2,437 feet, and is at present the deepest shaft of Prussian mining.
5. The winding shaft of the Rosebridge colliery, near Wigan, Lancashire, England, has a depth of 2,458 feet. Coal is drawn from the "hanging on" at the 2,418-foot level; the time of the cage running this distance being 55 seconds; the winding rope has, therefore, an average speed of 44 feet per second.
6. A shaft at the coal mines of St. Luke, near St. Chaumont, in the Loire department, France, reaches 2,253 feet.
7. The shaft of the Dunkirk colliery, near Dunkinfield, Lancashire, is 2,069 feet deep, but the mining is prosecuted to a further depth of 755 feet by shafts from the lower levels, making a total depth of the mine of 2,824 feet.
8. The deepest shaft of the collieries, near Ronchamp, in France, is 1,881 feet. A similar depth has been reached by the argentiferous mine near Kongsberg, in Norway. The mines belonging to the Roros copper works, in Norway, have worked to the depth of from 2,540 to 3,270 feet.
9. The Amalia shaft in the mine works, near Schemnitz, in Hungary, is 1,782 feet.
10. The No. 1 Camphausen shaft, near Fishbach, in the department of the Saarbrück collieries, has now reached the depth of 1,650 feet, and may possibly become the deepest shaft in Prussian coal mining.

Although the depths to which the shafts enumerated have penetrated into the interior of the earth in the art and practice of mining may appear mighty, and may be an expressive witness of the great progress made in mining pursuits, yet, on the other hand, the above results may be considered insignificantly small when we compare them with the extent of the earth's crust and the diameter of the earth. The deepest bore-hole in the world is the artesian spring at Potsdam, in Missouri, which reaches a depth of 5,500 feet.—*London Mining Journal*.

## A Stage Driver's Opinion of the Black Hills.

The following letter is published in the *Eureka Sentinel*, written by an old stage driver now at Deadwood:

Times are kind of shading off out here just at present, and I think the chances are that it will be duller before long. The fact is, the country has been overrated. All those fellows that came rushing here in the spring, expecting to find mother California lying around loose, have got mighty badly fooled. Why, all the gold taken out since the first discovery wouldn't equal one old creek, such as we used to pan around in over in the Golden State, along in '50. The big rush here early in the season, has been followed by another just as big a one, but the last is going out instead of coming in, and the boys mostly prefer to walk; its cheaper and good healthy exercise, you see; and, besides, it don't make such a heavy draft on the pocket. I've been following the old business for the last three months, driving stage between Deadwood and Custer City, but I quit suddenly a week ago. It put me in mind of old times on the Geiger grade in Virginia City, along from '60 to '65. The road agents are just about as thick and twice as sassy. The robbing of the stages has got to be a regular business, and the boys have got it right down to a system. They know just as well when treasure is going out as the express agents. I've been stopped seven times since I've been on the route, and almost every time in one place, about 15 miles from the city, where the road runs through some underbrush, in a small canyon. My team got so used to it that they would pull up and stop just as regular as if it was at the station. The express company don't run any shotgun messengers, and the drivers ain't hired to fight, so the highwaymen have an easy trick. There ain't so much of the business going on as there was a month or two ago, but that is owing to the fact that treasure shipments are running rather light. I am thinking of going over to the San Juan country next week. This town will be too dead to kill in another month. There is a big talk about quartz, but I don't think the ledges are permanent. I have talked with lots of old Nevada miners, and they agree with me. Some of the claims were rich on top, but there are no indications of their holding out very long. It don't look like a mineral country to me, but I may be mistaken. There have been no new discoveries for some time. Some of the placer claims on Deadwood, Whitewood and Castle creeks are paying well.

Big Horn is a failure; at least, there has been no news of any big finds having been discovered yet. There was a big rush to that region a month ago, but very few people are starting now; and those who have come back bring discouraging reports from that section.

Most of the boys from Nevada are intending to go back to the Silver State this winter. It will be fearful rough here, and all kinds of mining will cease as soon as snow falls. Grub is pretty cheap, but it takes good rustling to get hold of the necessary coin to put up for it.

## Forest Fires.

There is a trite saying that wilful waste makes woful want. The truth of the axiom is shown in every-day life, and one does not have far to go to witness lamentable instances of extravagance and suffering as the two extremes of which the one is but the natural fruit of the other. Casual notice of the forest fires that have occurred in this State within three months, enumerates one in Los Angeles county, where 7,000 acres of timber were burned; another in the Santa Cruz mountains, which raged for two weeks and destroyed an immense amount of valuable timber; a third in the Coast range; a fourth now raging in the redwoods between this city and Santa Cruz; a fifth in San Mateo county, where the Spring Valley Water Company has suffered heavily, and where eight miles of forest and timber have been burned to the ground.

The question arises, how can these fires be prevented?—they can not be extinguished. What assurance have we that half the timber in the State may not at some time be swept away by a conflagration, and the forests which are the pride and boast of California be transformed into blackened and forbidding wastes? Assuredly some protection should be given the owners of these vast tracts of timber. They are now at the mercy of careless people, who set their forests a-fire and destroy their property with the utmost impunity. As the fires cannot be quenched when once started, the Legislature and the State authorities should take the matter in hand and create a law that shall declare private carelessness a public crime in this destruction of private property. Were a law enacted making the firing of forests a penal offense, punishable by fine and imprisonment, there would be fewer fires, and our timber would no longer be wantonly or carelessly destroyed by tramps, hunters, campers, etc. At the present rate of destruction, it will be but a few years before our mountain sides will be entirely destitute of timber, and building material will increase in price, owing to nothing save its useless destruction. If the members of the Assembly lately chosen from this county would co-operate with the members from Los Angeles, Santa Cruz and San Mateo counties, we doubt not that a law providing for the protection of our timber could be passed at the next session of the Legislature.—*San Jose Mercury*.

## Good Health.

## Lock Jaw.

EDITORS PRESS:—A severe attack of lock jaw is considered fatal. One of the leading physicians of Santa Clara, some years ago, said, "Jewett, neither you nor any other man can cure lock jaw." Not long after this, it was in the year 1871, there happened a case of lock jaw at Bakersfield of five days' endurance. The doctor in attendance had pronounced the case incurable. It was caused by a pistol ball shot through the foot. As soon as I heard of the case one of my sons accompanied me from Rio Buena rancho, sixteen miles above on Kern river, to a shanty on his farm below, where the afflicted lay with jaws closed, the upper front teeth set over by the lower ones. After liberty was granted to work upon him the writer said: "My friend, within 60 minutes you will be able to open your mouth, sir." He smiled, and it was truly verified.

The process was quite similar to the curing of sunstroke and apoplexy, as related in the *RURAL PRESS* of some months since. It was as follows: Three or more pails of water were heated to about 114° and poured from a coffee pot in a small stream, by Philo D. Jewett, on to the palm of my right hand, with the left pressing against his forehead. The water ran down from the finger ends, on to the spinal column, and base back bead of the patient, passing over each cheek on to the ground. This followed a hot water bath applied to feet and ankles, wiping dry with a coarse towel, then manipulating downwards, for a moment; soon binding a quantity of moist tobacco leaves over the wounded foot. While pouring the hot water, running from the hand, the tension gave way sufficient to pass his finger in and tongue out. The next time I saw him, one month after, he was in the village working at his trade as a painter. One time, in the village of Jackson, Michigan, I saw a notice that Ira Laudon, the forman track layer, was lying nearly dead with sunstroke. The writer soon visited this sufferer and applied the water treatment to his feet and back head, then manipulating downward, which cured or restored him in one treatment so that he went to work soon after. This man Laudon was subject to epileptic fits, periodically, which were fully checked, if not cured. I have been successful in curing epilepsy by the same process.

SOLOMON W. JEWETT.

Shepherd Home, Vt.

## Health and Flour.

A correspondent of the *Chicago Tribune* makes the following points: People are waking up to the fact that wheat is incomparably the royal grain, but that in our process of preparing it for food, it has been the most fearfully abused substance in the world. The term "Graham" is a misnomer, and ought to be no longer used—it means anything and everything—it is simply a cover under which is palmed off the poorest and vilest of all wheat preparations. The current "recipe" for "Graham" is third-rate flour mixed with bran. Any man who knows the vast difference there is in wheat food, knows how very far such a flour is from being the sweet and palatable food, sound, ripe and full-grown wheat is capable of yielding. Dealers who handle, and the thousands of persons who eat "Graham," know nothing whatever of the beautiful flavors of the pure, ripe, unadulterated grains.

Phosphorus, which is generally furnished to the system in wheat, is the great pabulum of the nerve tissues, and nerve force underlies and is the motive power of all the functions of the body. The system can no more digest without nerve power than an engine can run without steam, and the same can be said of every other function. This is wherein the whole wheat is most valuable, and wherein white or bolted flour is lamentably deficient. The latter does not supply nerve food—for 196 pounds of ripe, plump wheat contains over four times as much of this vital food as the same weight of white flour does—so that to get the necessary normal amount of mineral food there is in 196 pounds of wheat one has to eat over four barrels of white flour, and thus tax the system to digest over four times as much starch as nature ever intended. Is it any wonder, therefore, that digestion so commonly gives out, that dyspepsia and constipation, with all their attendant evils, are so constant and prevalent?

Several of your correspondents make mention of what they call "attrition flour." During a recent visit to Boston I found this flour much in use, and highly regarded. It should be called cold-ground (or disintegrated) whole wheat flour—although that hardly expresses it—for the astonishing part of it is that the bran portion of the wheat is reduced to an even fineness with the rest of the flour. This is a now, and indeed a great achievement; there is nothing like it in the whole history of flour as food. The cold grinding, or reduction without the use of

millstones, completely protects the food elements from any injury; and this even fineness of the bran portions of the wheat furnishes all that part in which the vital elements reside in a condition eminently promotive of digestion and assimilation, without irritation to the most delicate stomach; and furthermore, it adapts a whole-wheat flour trade, the purposes for which white or bolted flour has heretofore been exclusively used. Hence, not only bread, biscuit, gems, etc., but doughnuts, cakes of various kinds, pie-crust, crackers of all kinds, and the whole range of cooked foods of which flour is a component part, can be made of flour containing all the food elements of the wheat.

## Quackeries and Nostrums.

The following is from the *Pacific Rural Press*: As our readers know, we have returned an unyielding refusal to all those who would use our columns for advertising quacks and quacks' nostrums. We do this on principle. It is true that by such a course we lose many dollars which other publishers gather in, but we have the consciousness of a right course and of guarding our readers from many (and oft times serious) impositions; and this is better than gold.

Ever and anon there comes new evidence of the wisdom of our position on this matter. Analyses made of the most widely advertised compounds, show that they are either dangerous or worthless, or else a very little good is sold for 100 times its value, and thus the people are swindled. The latest testimony of the character of "medicines" which we see advertised all around us, comes from analyses made for the *Industrie Blatter*, of Berlin. From a translation of these, made for the *Scientific American*, we quote the following:

Dr. Pierce's golden medical discovery. A one dollar bottle holds 220 grains of a brownish colored clear liquid, consisting of 15 grains pure honey, one grain extract of poisonous or acrid lettuce (bot. *herba lactuce virose*), two grains laudanum, 100 grains dilute alcohol (64%), tasting like fusel oil and wood spirit, with 105 grains of water.

American toothache drops, made by Majewsky, in Warsaw, have different compositions. Those which took the prize at Vienna consisted of common salt and brandy, colored with harmless cochineal red (price, 37½ cts).

Ayer's pills consists of pepper, colocynth, gamboge (*guttif*), and aloes.

Ayer's hair vigor, a solution of 0.6% sugar of lead.

Horsford's baking powder. One powder contains acid phosphate of lime and magnesia mixed with a certain quantity of flour; the other is bicarbonate of soda.

Brandreth's pills, says Dr. Hayer, consist of gamboge (*gummi-resina guttae*), podophyllin, inspissated juice of physalocia, saffron adulterated with yellow root, pulverized cloves and oil of peppermint. The editor states in a foot note that, according to the assertion of two American druggists and one merchant, gamboge is present in Brandreth's pills, but that the action of the pills does not correspond to this constituent, in which latter assertion, we think, the editor is slightly mistaken, the pill being really cathartic.

Butter powders seem to be a favorite article of manufacture abroad, and are supposed to aid in making good butter quickly at any season of the year. They consist of bicarbonate of soda (baking powder), colored with turmeric or other less harmless pigment.

Hamburger tea contains 32 parts of senna leaves, 16 of manna, 8 of coriander, and 1 of tartaric acid, ground up together.

Dr. Sage's catarrh remedy, says Schadler, contains 0.5 grammes of carbolic acid, 0.5 grammes camphor, and 10 grammes common salt, which are to be dissolved in four-sevenths liter of water, and injected into the nostrils. It appears very probable that the wide reputation of this remedy is a deserved one, and the publication of its constituents will rather increase than retard its sale.

Schenk's mandrake pills. Hager says that these pills contain no mandrake. They do contain the constituents of cayenne pepper, a bitter extract, and some vegetable powder containing tannin.

R. R. R. consists of a reddish-yellow liquid, that smells of ammonia and camphor. It contains 14 parts soap, 40 parts of 10% ammonia, 640 parts alcoholic extract of cayenne or Spanish pepper, 4 parts camphor and 2 parts rosmarin oil.

Mrs. Winslow's soothing syrup consists, says Hager, of 8 parts of white simple syrup mixed with 1 part of a tincture made by extracting 10 parts of freshly crushed fennel seed and one part of oil of fennel, with 60% of spirits.

Sozodont for the teeth. The reddish liquid consists of a solution of 5 grammes oil soap in 6 grammes glycerine, 30 grammes spirits, 20 grammes of water, perfumed with a few drops of oil of peppermint, oil of cloves, oil of cinnamon, and oil of anise, and colored with cochineal. The powder is a mixture of carbonate of lime, magnesia and Florentine orris root. None of the ingredients can be considered objectionable.

## USEFUL INFORMATION.

## Petroleum Production.

*Stowell's Petroleum Reporter* has the following, which will interest all owning oil properties: From the present condition of things in the oil trade we have reason to apprehend that within the next six months more tankage capacity will be required than we now have available in the oil regions. Our views, in brief, for this are as follows: Although the statement of stocks of refined, at the six principal European ports, do not make a very large show, yet it must be borne in mind that the exportation into the interior consuming points of Europe, have been far greater this year than ever before, and we are well advised when we say that Europe is more largely stocked in distributed oil to-day than at any former period.

In consequence of this it is altogether reasonable to conclude that exports will materially diminish from this time until the opening of next year's business—and as the production in the region will undoubtedly be kept up to its present limit, and liable to be increased in the next 60 or 90 days—and as the home trade cannot be counted upon to consume the surplus thrown upon us by reason of the diminished exports, we may look for a considerable daily increase of our crude stocks.

This may throw upon us the misfortune of a deluge of oil, unless tankage is provided in time to take care of it. We regret to know that considerable of the tankage of the region, which was at one time available, is by reason of non-use, unavailable now; also that a large number of tanks have been destroyed by lightning within the last two years, while only a few have been built. We earnestly suggest prompt attention to this obvious matter. It will be observed that prices need not materially decline, notwithstanding the increased stock, for there is undoubtedly ready capital enough in the country to carry certificates, but no amount of capital will carry actual oil if the necessary tankage capacity is wanting.

OIL OF ROSES.—The world's supply of "attar of roses" is to be cut off. Can California enter the production? We read in the *British Trade Journal* that one result of the Russian General Gourko's adventurous rush through the Balkan chain is seen in the desolation of the lovely Tundja valley, and the almost complete extinction of a branch of agriculture peculiar to Roumelia. We refer to the culture of roses, carried on for the sake of the inestimable essential oil known as "attar." Kezanlik, which has not long been relieved from the odious presence of the marauding Cossacks—is the center of this remarkable industry, the annual value of which has been computed to be not less than \$80,000. But the Roumelian peasants have now to thank Russian aggression for depriving them, at least for some years to come, of this source of livelihood. The great rose field of Turkey, formerly the abode of peace and plenty, has been converted into a wilderness, and Europe must henceforth look elsewhere than to the Balkan slopes for its supplies of "attar." It has been suggested that India is quite able to supply the deficiency, but this is doubtful, and there is a significance in the fact that rose oil has made a great leap upwards within the last few weeks, the best being worth, at the present time, 40s. per oz., with every probability of a further advance. Dr. Septimus Piesse, an authority on all matters relating to perfumes, states the average yearly production of attar in the now devastated districts to be as follows: District of Kezanlik, 1,736 lbs.; Gucupsa, 754 lbs.; Karadja-Bahg, 384 lbs.; Tohirpan, 162 lbs.; Koyoun-Tepe, 118 lbs.; Pazardjik, 110 lbs.; Yeni-Saghra, 108 lbs.; Zaaghra, 98 lbs.—say a total of 3,470 lbs., or 55,520 ozs.

DESTROYING UNITED STATES TIMBER.—The Secretary of the Interior has addressed a letter to the Attorney-General with regard to the timber depredations. Speaking of the proposal of the United States Attorney for the District of Minnesota to purchase logs cut on the public lands, he says: "While it is my desire to dispose of the logs seized on terms as advantageous as possible, it is the principal object of the operations of this department to put an end to the timber depredations. It is above all things necessary that the depredators be effectually deprived of every possibility of deriving any benefit or profits from the wrongful acts they have committed. It is for this reason that I have directed that the stumpage system hitherto prevailing be discontinued. For the same reasons I withhold my approval from every compromise which would permit the logs seized to pass into the possession of the depredators with any chance of profit, and I insist upon the current market price of the logs at the places where they are held. I desire to make those who have hitherto carried on these depredations with profit understand that in attempting to steal timber from the public lands they will in any event lose the value of their labor and their expenses, and expose themselves to criminal prosecution. With regard to the criminal prosecution of depredators I would recommend that they be not confined to those mostly poor persons who actually cut timber on the public lands with their own hands, but that they be directed as well, and principally, against the parties who are found to have organized and directed the stealing of timber on a large scale, and derived from that criminal practice the greatest profit."

ADVERTISING RATES.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	25	80	\$ 2.00	\$ 5.00
Half inch (1 square).	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.

SUBSCRIPTION IN ADVANCE—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, Oct. 6, 1877.

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Loss by the Patent Office Fire; The Dexter Scroll Saw; An Improved Quicksilver Condenser; The New Stock Exchange, 209. The Week; Surveying in Mountain Regions; A Powder to Make Gold; Notices of Recent Patents, 216. A Mechanical Dictionary; Items of Interest from the Mines; Dedication of the New Board Room, 217. Save the Salmon; Book Notices, 220.

ILLUSTRATIONS.—Castle & Long's Quicksilver Condenser; The Mounted Dexter Scroll Saw, 209. Chain Bridge Over the River Dnieper, at Kieff, Russia, 217.

CORRESPONDENCE.—Two Days in the High Sierras with Hooker and Gray, 210.

MECHANICAL PROGRESS.—Making Picture Frame Ornaments; English Business Reviving; Heating Towns by Steam; Note on Hot Journals; Fast Run; Industrial Arts Exhibition at Leipzig; Track Laying Machine; Making Glass Eyes; Current Fashions in Jewelry; New Steam Dredging Machine; New Anti-Corrosive for Boilers; A Self-Extinguishing Fire; Separation of Iron Ore by Magnetism, 211.

SCIENTIFIC PROGRESS.—United Effort for Science; Another Electric Candle; Prehistoric Monsters; Iron and Glue in Street Dust; Gallium; Purifying Iron with Chlorine, 211.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 212.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Oregon and Utah, 211-221.

GOOD HEALTH.—Lock Jaw; Health and Flour, Quackeries and Nostrums, 215.

USEFUL INFORMATION.—Petroleum Production; Oil of Roses; Destroying United States Timber, 215.

MISCELLANEOUS.—Investments in Sierra County; Eastern Nevada Mining Camps; An Idea in Refrigeration, 210. Placer County Gravel Channels; Australian Progress; Minor Patents—Their Real Value; Deep Mining Shafes in Europe, 214. A Stage Driver's Opinion of the Back Hills; Forest Fires, 215. Metal Growth; Natural Products of Placer County; River Mining; Early History of the Overman Mine; Base Metal Mines; Means of Preserving Milk, 218.

GENERAL NEWS ITEMS on page 221 and other pages.

## NEW ADVERTISEMENTS.

Leather Belting, H. Royer, S. F.; Baird's Scientific Book Catalogues, Henry Carey Baird & Co., Philadelphia; Tarrant's Seltzer Aperient.

## The Week.

The week has passed without any startling developments in any of the mines having been announced. The bonanzas continue to pour out their treasures, and all the other Comstock mines continue their prospecting operations in hopes of striking rich bodies of ore. Mining men are greatly interested in what seems to be a weakening in the amount of water flowing into the flooded mines—a long wished for result of such continuous pumping operations. It is sincerely to be hoped that the flooded mines will shortly be freed again, so as to be worked in the lower levels, but most people had come to the conclusion that they must wait for the completion of the Sutro tunnel to see the mines drained again. It seems that Sutro, however, intends having a distinct understanding about the royalty question before he will let this water drain off, and insists that he will bulkhead the tunnel before he will carry off the water for nothing. If the water keeps on as bad as it has previously, Sutro will, no doubt, have the best of it, and stockholders will insist that some arrangement be made to let the water run off, instead of paying so much for pumping it out. In gravel mining, operations have been entirely discontinued nearly all over the State, from lack of water, and the miners are still getting their claims ready for work when the water comes. They are all hoping for a big water season this year, the last two seasons having been provokingly short. The shortness of the season, however, will be at least beneficial in one respect, for all the claims will be in first-rate order for vigorous and effective operations.

## Surveying in Mountainous Regions.

In regard to the systems of working generally employed in the different surveys west of the Missouri river, where such a large extent and variety of country has to be traversed and surveyed in a limited time, little is known by the general public. The survey is divided up into different parties, each one of which has special work to perform. There is generally a chief and assistant topographer, a geologist, two packers and a cook, with sometimes a botanist and a photographer. In the Hayden survey, where pretty accurate work is done, considering the area traversed, there are usually seven parties. Four are assigned to specific areas for the performance of topographical and geological work; one attends to the primary triangulation (under Mr. A. D. Wilson); one attends to collecting photographic views of the most important scenery; and one transports supplies to the various districts. A system of triangles is generally extended over the whole area, while at the same time topographical sketches and angles are taken, barometrical readings made at all occupied places, camps, places of note, passes, etc. The geological work is done at the same time, and notes taken in all matters connected with the survey, such as agricultural and mineral resources, etc. These notes, etc., are then worked up in the office at Washington during the winter by the different individuals, and their reports are incorporated into that of the United States Geologist, which is then published.

In 1875 the work of the Hayden survey was generally done by means of the plane-table, and re-inforced by means of both vertical and drainage sketches from all the stations, and also by time-meanders of all the main streams, and generally by a running sketch of the routes traveled. In Colorado, in that year, by meandering, Mr. Chittenden surveyed the San Juan river, the La Plata, the Mancos and the Dolores creeks, all of them considerable streams, and besides these, the McElmo and Montezuma creeks. In the meander he made a trigonometric location as often as once in ten miles.

Professor Hayden, in his letter to the Secretary, in the report of 1875, dated, however, March, 1877, expresses the opinion that the plane-table system, generally used that summer, is admirably adapted to a low, broken country, where good "points" are abundant, and works also extremely well in a simple canyon country, where there are surrounding prominent points at not too great a distance. But in a mountainous country it could not be used to any great advantage, and was eventually abandoned in all mountain work. In a low, broken and canyon country it is probably the best system that can be used; but in the ordinary rolling and mountainous country of the Northwest it will not repay the extra weight and time which its use entails.

In any but a very mountainous country, a system of meander, Prof. Hayden thinks, seems to be almost necessary to make work on a scale of four inches to the mile complete. It is the abuse and not the use of the old odometer system that has brought it into so much discredit. If properly checked, the meanders give to the more important portions of the country, as the traveled routes and principal rivers, the greater degree of accuracy which is their due.

The third and only remaining system in use in the West is that generally employed in this survey, and formerly used in the California State geological survey, and in that of the fortieth parallel. It consists of a system of vertical and horizontal sketches based on a rather elaborate triangulation, and checked by numerous angles, both vertical and horizontal. This system is peculiarly adapted to a rolling or mountainous country, and in such a country cannot be equalled by either of the other modes. It works well, too, in a country of different character, and is, probably, on the whole, Prof. Hayden says, the best system on which to base work in the average country of the West. It should, however, be supplemented by good meanders of all the main roads and rivers. In the work of the Hayden survey, last summer, all these systems were employed, and the above remarks are the immediate result of the observations.

THE STATE DEBT.—According to the Controller's report the total funded debt of the State, on June 30th, 1877, was: Civil bonds of 1873, \$2,801,000; State Capitol bonds of 1870, \$250,000; State Capitol bonds of 1872, \$250,000; soldiers' relief bonds, \$95,500; civil bonds of 1860, \$1,500; civil bonds of 1857, \$13,000; making a total of \$3,411,000. As all the bonds of the issue of 1857 and 1860 have been called in, and the interest ceased on the 31st of July, 1877, the funded debt bearing interest at this date will only amount to \$3,396,500; bonds held in private hands, \$731,500; bonds held in trust by the State Treasurer for the school fund, \$1,737,500; bonds held in trust by the State Treasurer for the University fund, \$811,500; bonds held in trust by Regents of the State University, \$116,000.

SUCCESSFUL tests have been made in this city with the telephone, over the Merchants' Exchange line from the Exchange rooms to the Point Lobos station, a distance of seven miles. Singing and talking were carried on, and in each instance the words were distinctly heard and the speaker's voice readily recognized.

## A Powder to Make Gold.

Our old correspondent, Mr. Henry Sewell, who has recently returned from Chile, gives us some items concerning the doings of Paraff, of oleomargarine fame, who is exercising his ingenuity in getting up some wonderful schemes for the Chileans to make money fast. Paraff will be recollected by many here as the man who was going to make first-class butter out of old fat, lard or any other kind of grease. He succeeded in getting considerable money out of the operation, but the butter did not "go down." He then turned his attention to metallurgical operations, and had some wonderful processes for getting something out of nothing. He finally left San Francisco, however, for more congenial climes, where his doings would not be inquired into so closely.

He is now in Chile, and, according to Mr. Sewell's account, is flourishing in a manner no doubt satisfactory to himself, whatever the result may be to the Chileans in the end. When he first went to Santiago he started up the oleomargarine business again, but some Frenchman there stopped the business, as he owned a patent for the process himself. Then Paraff's genius showed itself in another direction. Chile, it is well known, produces 60% of all the copper consumed in the world. There are large masses of copper sulphurets, assaying from \$10 to \$15 per ton in gold, but which are practically useless, as it costs more to get out the gold than the gold is worth.

Paraff announced that he was able and prepared to extract this gold at a profit, and, moreover, could get more out of the sulphurets than they assayed. He stated that he had an ingredient which, mixed with the ore in a certain way, would bring out not only the \$15 per ton proved to be present by both humid and fire assay, but also from half a pound to a pound of gold beside to every hundred pounds of copper sulphurets. This proportion rather took the Chileans, who, if the statement were verified, had more riches at their doors than they ever dreamed of. Paraff proceeded to prove it. He gave some of them a portion of his peculiar powder, and told them to assay it. Result: no gold, no silver. But this powder could precipitate out of the mass of copper sulphurets the quantity of gold he stated. The powder is taken publicly and mixed with a lot of the sulphurets, and the whole reduced in a crucible. Result, 35 pounds of gold—pure, virgin gold, which, assayed at the mint, was found to be perfectly pure.

Paraff, therefore, has at last found the philosopher's stone. The success created a profound sensation. Mining engineers, chemists and those high in authority are converted to his belief. Now, large and expensive works are being erected in Santiago to work the copper sulphurets by this process. Paraff has sold to the Chileans alone stock in the company to the amount of \$200,000. He has, moreover, purchased for himself at the price of \$150,000 a villa residence formerly belonging to Harry Meigs, near Santiago, where he has large gardens and a palatial home. The place cost originally over \$200,000.

All this has been accomplished in a very shrewd manner. In the first place the copper sulphurets contained some gold, as they all knew. They were first-rate things to operate on. He alone had the secret of this wonderful powder, and he alone must manage the undertaking. By working in a small way he turns out 35 pounds of gold, and other lots in smaller quantities. No large operations could be carried on without extensive works. These could not be built without selling stock, and Paraff sells the stock. Some of this has been offered even in New York, Colorado and elsewhere, but we hardly think much of it has been bought up in this country. The ingredients for making gold, discovered by Paraff, is no new thing. Scarcely a generation passes that half a dozen people do not discover it. The only thing is that the gold it makes is seldom seen. Paraff is ahead on this, as his gold has not only been seen, but refined at the mint.

Mr. Sewell informs us that he denounced the whole scheme in the papers, but such is the hold Paraff has on the people, that, although Sewell is a mining engineer of experience, a native of the country, and related to several high officials in the government, his words fell on barren ground, and his advice has not been heeded, so that Paraff comes off victorious. Paraff is also forming several other companies and selling stock or patent rights. Among them is a plan for watering the streets with chloride of calcium, such as is done elsewhere. It will hardly need a shrewd observer to conclude that when all the stock is sold in the companies, Paraff's ingredient for making gold will be found to be his wits, and he will not even want to water the stock with or without chloride of calcium.

The reason why he has been so successful, is that those persons calling themselves mining engineers who are there, seem to have as much faith in Paraff as others. One of them has written to a relative here telling him not to denounce Paraff here, as he is really doing wonderful things. This from a mining engineer educated in Germany. Paraff was shrewd in other ways, also. In order to raise the value

of the stock, after experimenting on a small scale, he shipped 12 boxes of the regulus to Liverpool on the Pacific Steam Navigation steamer *Valparaiso*, on the 28th of March, 1877. The shipper was a person of the first position in Valparaiso, Mr. A. Edwards, who is worth upwards of twenty millions, made in the Chilean silver mines. Paraff requested this firm to place this valuable (?) cargo along with the silver bullion in the iron safe of the vessel, and paid a high freight therefor. Mr. Sewell went to Liverpool on the same steamer, and asserted at the time that the regulus could never be sold, as it really only contained a few ounces to the ton. Persons on board ridiculed the statement. On the strength of this shipment Mr. Paraff sold stock sufficient to supply gold to fix up the regulus on a larger scale. The regulus never was sold, but was shipped back to Chile on a sailing vessel.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

BATH HOUSE.—Francis Despoix and Joseph Reboul, S. F. The improvements designed by these inventors are in connection with such vessels or floating structures as are provided with bathing or swimming tanks. This floating structure is divided into two main compartments, one at each end of the vessel, leaving a promenade entirely around each. The roof is made of glass. In each compartment is a bathing tank with an adjustable bottom. The bottom is supported by hangers or other suitable means, so that it can be inclined to give shallow water at one end and deep water at the other end, or it can be lowered to give a uniform depth. The walls of the hull, and also the bottom, are made double, and the space between the walls is filled with saw-dust, or other non-conducting material, to prevent the temperature of the outside water from affecting the temperature of the water in the swimming tank. The dressing rooms are arranged around the tank in the usual way. The boiler is set between the two compartments. A steam pump supplies water for the tanks, the water being passed through a heater before introducing it into the tanks so as to raise the temperature to the desired degree. The water pipes which conduct the water from the heater to the tank, pass around the tank inside the wall of the hull, and numerous branch tubes connect this pipe with the tank at different points, so as to distribute it equally. At both ends of each tank are openings through the side of the hull, and these openings are closed by valves, to shut out the water when necessary. By opening these valves the outside water is allowed to pass into each tank at one end and out at the other, thus cleaning them thoroughly and easily.

BELT.—Herman Royer, S. F. Mr. Royer, who has a large factory for the manufacture of belting, etc., has perfected a number of valuable inventions in this line. His latest one is a combination of bark or chemically-tanned leather and fullered rawhide, the latter prepared by a process also invented by Mr. Royer. The characteristic quality of bark-tanned leather is its hardness and ability to resist compression, while the fullered rawhide is noted for its elasticity and tensile strength. It will be manifest that when belts run over pulleys (and especially if the pulleys are of small diameter and the belts run slack), the tendency is to compress the inner side of the belt, while the outer side will be correspondingly stretched. This compression and elongation will not be perfectly effected by the use of ordinary leather, and, if fullered rawhide is used, the repeated compression and relaxation of the interior surface, as it passes around the pulley and again becomes straightened, has a tendency to cut it after continued use. In this invention, therefore, Mr. Royer makes the inner part of the belt, which comes in contact with the pulley, of ordinary tanned leather, and the outer part is made of fullered rawhide or mechanically prepared leather. These two parts are cemented, riveted or otherwise secured together in any suitable manner, so as to form a solid belt; or the belt may be made of a single piece, one side of which has been chemically tanned, while the other side is fullered or prepared in a mechanical manner, thus attaining the object of hardness upon one side and elasticity upon the other in one piece. This style of belting has met with great favor wherever introduced.

BED.—Bartholomew Essig, Sacramento, Cal.

This invention relates to a novel construction for bed bottoms, comprising the springs and their adjustment to regulate their elasticity, and also their combination with the frame of the bedstead, so as to serve as fastenings as well as springs. The invention also relates to a novel method of elevating and depressing the head of the bed for invalids, or for other purposes.

BALL AND SOCKET COUPLING.—Wm. Lane, S. F.

The coupling device is for connecting two objects, such as, for instance, two railway cars, connecting pieces of chains, attaching a wagon pole to a wagon, etc. The device is simple and convenient, but a detailed description would be unintelligible without the aid of engravings.

## A Mechanical Dictionary.\*

We take great pleasure in announcing to our readers the completion of Knight's American Mechanical Dictionary, which has just been published by the well-known *Riverside Press*; its advent should be hailed with satisfaction by every practical man in the land, for it relieves a want that has long been felt among all classes engaged in industrial pursuits.

This work is the result of twenty-five years application, much of the time having been passed by the author in the United States Patent Office, where he was engaged in editing the Patent Office Report and classifying patents, and subsequently editing the *Official Gazette*, and systematizing for examination the 20,000 applications for patents which yearly are presented to that office. Sitting at the very center and focus of the mechanical thought of the country, he saw the necessity for a compendious description of the tools, machinery, processes and appliances of the arts and sciences—in short, a *Dictionary of Mechanical Terms*.

The value of a work of reference depends largely upon its index. When one has a question to ask of an ordinary encyclopedia it is frequently very difficult to determine under which title or heading to look. The MINING AND SCIENTIFIC PRESS Patent Agency have found this work extremely convenient and of great practical value, and take pleasure in recommending it to others.

The author has invented a system of what he terms "Specific Indexes" by the use of which the inquirer is guided direct to the information he is in quest of, even though he be entirely ignorant of the name of a thing, and have but the most vague and general notion of its use. This is accomplished by grouping under the general title of each science, art, trade, or profession, a list or "specific index" of every article in the book bearing any relation to the subject in question. The titles of these indexes are in turn grouped on page v. vol. 1, so that by a glance one may determine which index to follow.

Beside the use above mentioned, the "specific indexes" afford the reader an excellent opportunity for investigating thoroughly all that pertains directly or indirectly to any special subject, by using the index under the title of that subject, as a sort of head-center, and following out its various branches through all their ramifications.

Fifteen thousand words are thus assembled in what may be called these professional and trade vocabularies.

Another unique and valuable feature of the work is a *History of Inventions*. In these days of "modern improvements" one is very apt to placidly accept the result of long ages of patient ingenuity, without stopping to inquire into the history of the thousand and one appliances for comfort by which we are surrounded. Yet nothing can be more instructive or entertaining than to follow the gradual development of mechanical ideas, from crude forms of early times to the perfect fruition of to-day.

The author has given, in connection with a description of each machine, tool, instrument or mechanical appliance, a more or less circumstantial account of its history. A sort of mechanical biography in which the varying fortunes of each article is narrated in chronological sequence.

The work also contains another extremely valuable and entirely original feature, which the author has been pleased to term a *Technological Vocabulary*. Rather a formidable looking title, but simple enough in its significance.

There are many terms in use among various

trades and professions which are not to be found in any lexicon, because they are not "King's English." By constant use they have become semi-legitimate, and once in awhile a few of them have established their claim to respectability and been admitted to the citizenship of "Webster's Dictionary." But thousands of others, less fortunate, have no abiding place, and, though indispensable, have not yet been recognized in any etymological society. Here, then, is a rallying place for these words of "doubtful fame," and under the title of the thing to which each term pertains, we find them comfortably provided for.

Thus under "Mold," may be found a list of 127 "Molders' Terms," which are current amongst foundry workmen. Miners have their peculiar terms and phrases which are defined under the head of "Mining Appliances," etc.

The value of this vocabulary must be apparent. It is a sort of supplement to "Webster's Dictionary." Various technical operations are incapable of being explained without the use of these words, and the only wonder is that a special "Technical Dictionary" has never been published before.

The idea of classifying them so that all terms pertaining to any special trade or profession may be found appended to the article treating upon the same, is truly admirable. By this means one may thoroughly inform himself concerning any particular business, and venture among the knowing ones with unfeigned composure.

Philologists may gather here abundant material for investigation, and pause to marvel at

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

The machinery and lumber for the new mill of the De Frees mine is now being forwarded to Tuscarora.

The south drift 950-foot level of the El Dorado South is now all in very rich ore.

As soon as the station in joint cross-cut from 2135-foot level of the Alpha is finished, sinking the incline will be commenced.

They are getting a good stock of coal and ore on hand at the Modoc Con. mines, so a prosperous run is expected when the furnaces start up.

The ore being extracted from the Coso Con. mines is equal to any heretofore raised, and the stopes are looking well.

The Crown Point 2000-foot level south drift connection with the Belcher and Crown Point shaft affords a good circulation of air through the level. Cross-cutting this level will soon be commenced.

They are about resuming the work of sinking the shaft of the Wells-Fargo mine.

The 1400-foot level of the Overman has cooled off very much since the Belcher and Crown Point connection was made.

Chollar last week turned out 539 tons of ore, assaying \$22.50 per ton.

From September 19th to the 27th, inclusive, the Manhattan mill reduced 159 tons, the assay

## Dedication of the New Board Room.

In another column we give a description of the new building of the San Francisco Stock and Exchange Board, which was formally opened on Monday. A very large crowd was present at the first session in the new quarters. At 11 A. M. John W. Coleman, President of the Exchange, A. H. Lissak, Jr., Vice-President, and B. H. Coit, Chairman of the Board, ascended the rostrum, when Mr. Coleman delivered the following address:

*Members of the San Francisco Stock and Exchange Board—GENTLEMEN:* In taking possession for the first time of this building we are compelled by a mutual association of ideas to reflect at once upon the past, the present and the future, for I am sure that there is no one of us to whom this evidence is not emblematic of something more than the adornment it works to our beautiful city and comfort it affords to us. It stands not only as an exponent and outward and visible sign of the success, the magnitude, and flourishing condition of a great industrial pursuit, evidencing by its proportions, its finish and its solidity the completeness and perfection to which have already been brought all the appliances and methods for the workings of that pursuit, but it calls up at once the thought of the causes which have produced it and the future which it is to illustrate.

It reminds us not only of the projectors and workmen who fashioned it as it were but yesterday, but takes us back to the time not very far remote, when the tidings of the discovery of the precious metals in this then far-off land, summoned as by a tocsin the hold, the enterprising, and the ambitious from all quarters of the globe; and causes us, in thought, to accompany on their perilous journey the brave pioneers who, in obedience to that summons, left home and friends and old associations to tempt the fickle goddess of fortune in the new El Dorado. We follow them on the dreary march, over the waste of waters. We feel their homesickness and participate in their bright visions of success. We note how the pan and

CHAIN BRIDGE OVER THE RIVER DNEPER, AT KIEFF, RUSSIA

this prolific source of word making.

The work treats of 20,000 subjects, and is illustrated with 7,500 carefully prepared engravings. It would indeed be correct to say that the illustrations are fully 15,000 in number, inasmuch as a variety of distinct forms of a machine or tool (sometimes as many as forty), are frequently associated in a single cut. Had the object been to spread them out and make a show, these cuts might have been enumerated as separate figures.

The accompanying engraving is a sample of the full page engravings in "Knight's Mechanical Dictionary." It represents a chain bridge over the River Dnieper at Kieff, Russia. The structure is a very massive one, as the engraving shows, and is a type of this class of bridge. The river in its course passes through the most fertile provinces of Russia and through different climates. The most remarkable bridges are at Smolensk and Kieff. That at the latter place being the one shown in the engraving.

The book also contains seventy-five full-page plates of rare style and beauty. For general typographical excellence, and quality of paper and binding, the work is unsurpassed. It may be had by subscription only, in three bound volumes, containing in all 2,831 pages, at from \$24 to \$30 per set, according to style of binding. Address A. Roman & Co., No. 11 Montgomery street, San Francisco, general agents for the Pacific coast.

The Lyon County Times states that Supt. G. D. Holt will commence operations at once on the Niagara mine. This mine has laid idle for some months, owing to difficulty in the managing powers at San Francisco. Work is resumed under favorable circumstances.

value of which was \$36,118.37. Of this amount \$8,990.07 was from custom ore; \$1,934.82 from tribute mines, and the balance from the Frost and Curtis mines (\$25,193.48). At the Frost shaft the east and west stopes above the 570-foot level continue in good ore, with a large ledge. The 570 east drift has been discontinued for the present, having passed beyond the limit of the chimney.

The furnaces for the Grand Prize are about completed, and will start as soon as the shafting arrives.

A. C. Hamilton, Superintendent of the Imperial, has been appointed Superintendent of the Alpha Con., which adjoins the Imperial on the north.

The necessary machinery and equipments having been purchased for the Aztec mine, of Aztec district, Arizona, work will be vigorously prosecuted at once. The rich ore on the dump will be milled and shipped to this city.

Fourteen mining incorporations paid dividends this month.

An additional force of 35 or 40 men will be put to work in the Sutro tunnel. The majority will be employed in repairing and retimbering the tunnel.

Colonel Shafter has crossed the Rio Grande with 600 men and two Gatling guns to extricate Lieut. Bullis from his position. No collision is reported from the Rio Grande, but it is thought that Bullis and Shafter have fought with the Indians on Mexican soil. Shafter has been reinforced, and eight companies are now in Mexico. Gen. Folsom, commanding the Mexicans at Piedras Negras, has ordered his officers to keep on the trail of the Americans until they recross the river.

rocker and other rude and primitive appliances suggested and then gave way to the perfected methods and improved machinery, by the use and application of which the mighty results have been achieved, which necessitated our existence, and now support our organization. And in the ease and comfort of these new apartments, it is most fitting that we, to-day, acknowledge our obligations to the pioneers, and pay our tribute to their daring, their hardy virtues, and their grand achievements, and resolve that we all endeavor to meet the difficulties and surmount the obstacles we have to encounter with the same resolute purpose, the same energy and dignity which inspired them. But, perhaps, of more immediate and practical import than this recognition of such an occasion of the claims of our forerunners and founders, is the obvious lesson suggested by this retrospect for our guidance in the future. By considering what has been accomplished in the past with crude and insufficient means, we may the better attain to a realization of what may be accomplished in the future, aided by past experience and equipped with all the tremendous weapons of modern industrial warfare.

Then with affectionate remembrance and recognition of the past and the true and the brave who have departed with it, with due appreciation of the present and with bright and buoyant and brilliant hopes of the great future before us, let me welcome you to this noble structure within whose walls we are, I am confident, well and unanfully to play our part and to contribute our full share to the swelling glory of the young city we all love so well, and whose rising grandeur we have watched for years with such jealous pride.

The Creedmoor rifle team has returned,

### Metal Growth.

The following paper "On Native Copper, Silver and Gold in Abnormal Conditions," was recently read before the British Association by T. A. Readwin, and published in the London *Mining Journal*:

Attention has already been directed by me to some interesting recent changes from normal conditions of certain minerals, containing severally copper, silver and gold, and I would now specially refer to 15 specimens worthy of particular notice. All the metallic changes upon them have taken place at what may be called ordinary temperatures under ordinary conditions, and the observed changes have been distinguished by me (wanting a better term) as "Metal Growth." Perhaps, it is hardly safe to say that a mineral under observation at any time is in a normal condition, for most analyses disclose the presence of substances thought to be foreign to the chemical composition of the respective minerals analyzed. In short, it is not clear that we actually know the original, normal or ordinary conditions of any mineral whatsoever.

We are accustomed to say that every solid inorganic body is either amorphous or crystalline, but on examination it will be seen that none of the metal growths present are either crystalline or amorphous. They are really multimorphic, although several of them (like many others in my possession) have a general resemblance. It is observable that some of these palpably recent exudations have occurred before and others after the decomposition of a sulphide. Others, as far as surface appearances reveal, exuded wholly independently of sulphides, etc. A natural continuity of transference of mineral substances into vegetable matter in the production of new growths, forms and shapes, is a fact universally admitted; and I submit that it has yet to be shown whether there is not also a similar varied continuity in mineral metamorphoses, inasmuch as there are evident nearness of relationship betwixt abnormal aërocentric, plumose and other metallic shapes, and some of the lower vegetable appearances.

It has been suggested as possible that one of the results of the visible decomposition of a compound may be the generation of a kind of "formation force" in one of the substances contained in it, somewhat analogous to "vital force." Some such force may really be, but assuming it to be, it will only partially explain the phenomena now exhibited. There will remain unexplained the distinctive metal growth from undecomposed or normal sulphides, and more extraordinarily still, those growths from what appears to be pure silica in a normal condition, unassociated, as far as is known, with any other metallic substance. By process of negation the cause or causes of these mineral alterations may be pushed somewhat into a corner for determination. For example, under the known circumstances of these changes the action of water cannot be said to have had any influence; of gaseous influence none can be imagined. There is a total absence of the usual observed effects of heat. Atmospheric influence is barely possible. Light, potential in plant movements, somehow may be a possible aid in mineral movements or growths. A latent electro-motive power is also possible. No acid appears to have been concerned, except that of silicic acid, in the solid condition of quartz, in some of the specimens.

This leads to the idea that sometimes such growths derive their accumulating or aggregating particles from metal contained in the quartz matrix in a fluid state of infinite rarity, and as yet imperfectly understood, if not altogether unknown. The last idea in possible connection with electro-motive power of some kind may ultimately be found amongst the causes of such abnormal mineral conditions as these about to be described.

Commencing with one of the abnormal conditions of copper, I may mention that one specimen, a cherty-quartz fragment, commenced sending forth its copper exudations less than three years ago. Since February, 1876, I have noticed a growth of one-tenth of an inch, within the period of three weeks. The movement at the apex of the looped growth has sensibly increased since April 17th last.

Silver growth is shown in two specimens; these are recent silver growths from Mexican silver sulphide (argentite). The very numerous prolongations seen in the first of these are all of recent date, the brightest being of most infantine growth. All the silver debris has curled off since Christmas, and most of it has resulted since May 6th last. There have been fewer alterations of the second specimen in the same period. A third specimen exhibits interesting silver growth out of argentite in calcite. A fourth specimen affords a very interesting illustration of silver growth out of argentite in calcite. Nearly the whole of the silver sulphide is enclosed in a film, the materials of which will not effervesce in acid. And a fifth specimen is an extremely interesting example of silver growth out of what appears to be normal calcite unassociated with silver sulphide. The last three specimens were obtained by me on June 6th last at Kongsberg, in Norway, and had very recently been taken out of the ancient silver mine in the neighborhood. Since that date I have detected a few new splinter-like silver movements in the third of these specimens, and only one now little silver movement in the fifth; but in the fourth two small silver exudations have appeared from the film-covered

argentite, and numerous delicate and purely argentite growths in the cavities. The first and second of this series of specimens are Freiberg silver sulphide (Acanthite). The horse nail-like coil movement in the first specimen has taken place whilst in my possession, and the two similar exudations in the second specimen within the last three months.

With regard to gold growth, I will first refer to two specimens which show interesting recent argentiferous gold growths (or, more definitely, electrum growths) out of iron sulphide (pyrites) in a normal condition, associated with quartz. [Metal = 50 Au. 20 Ag.] Two other specimens show recent electrum growths out of decomposed pyrites, associated with quartz. A fifth specimen shows recent electrum growth in quartz (apparently) unassociated with any other metallic mineral. A sixth specimen shows extremely interesting recent electrum growths in an indexed quartz cavity, resulting chiefly since May 6th last. And a seventh specimen shows, perhaps, the most interesting illustration of recent electrum growths. One filament is one-tenth inch longer than it was on May 6th last. I may mention that I have also electrum growths out of galena, blende, mispickel, marcasite, tetrahedrite, tetradymite and harytes. In the present mineral associations, calcite appears to have a "superior affinity" for silver, and quartz for gold.

I select these illustrations from a considerable number of what are commonly called abnormal conditions of native metals, most of which, I think, may be not inaptly called metal growths. In conclusion, I beg to say that I do not think such facts as these are at all of uncommon occurrence, although they may have been for the most part unobserved, owing, it may be, to the popular idea that mineral substances took their present shape and forms in time periods very long anterior to the birth of living mineralogists. I have therefore, brought the facts forward in the hope that in the future more attention may be given to mineral changes in their relation to time.

### NATURAL PRODUCTS OF PLACER COUNTY.—

We have received some samples of clay, sand and coal from the Spinks mine near Lincoln. One who has seen it says the clay is known to be as good as there is in the world, and a Mr. Newman, of San Francisco, pronounces the sand very fine, it being the same as is used in the manufacture of pure white glass. The samples of coal we have seen quite firm, and far superior to that taken from the old coal mine at that place. The coal ledge is eight feet thick, and the quality retains its superiority as far as the drift is in, at present over 30 feet. There is a fine clay pipe factory at Lincoln, and a pottery could be erected on the site of this new mine that would possess many advantages. The clay is here in abundance. The water in the mine that has to be pumped out would be plenty to run the necessary machinery and mix the clay, and the coal would furnish fuel to burn all the pottery that can be made. Fuel is a big item of expense in the pottery business, each kiln operated costing in the neighborhood of \$2,000 per annum; at least two-thirds of that expense could be saved there and added to the profits of the concern. It is understood to be a good paying business, even where all the material, clay, water, fuel, etc., are obtained at great cost. It would seem a splendid opportunity for capitalists to take hold of this thing and build up a permanent and paying business. If a company will form and take hold of it, the owner, we understand, will put the property in at a very reasonable figure, and take any share desired, from one-tenth to one-third interest. Capitalists looking for safe investments would find this matter well worth a consideration at least.—*Placer Herald*.

**RIVER MINING.**—The Oroville *Mercury* says: Feather river is turning out a golden harvest this year, such as she never did before, if we except the year when the old Cape claim was worked. Near Long Bar a few men took out \$500 in a short time, after getting the bed of the river dry. At another point two men took out \$175 in 24 hours, or rather the part of it that they worked. Still further up one may see little squads of men at work, and in every place, so far as we can learn, they are doing better than ever before. The river is so low that it does not require much work to turn or flume it, and thus leave the bed bare and dry. Every old miner had in view some spot that he deemed rich, and expected to make his "pile" there if ever it came so that he could get rid of the water. This is his year, and it is amusing to see with what high hopes they are at work. The very best evidence that we have of his good judgment and industry is the large amount of dust they bring in and offer for sale. There are yet several companies that have not yet made any report of their progress. There is one on the Middle Fork, consisting of L. Delevan, J. C. Bierce, D. Paxton and others that is in the latter class. We confidently believe that the first rise in the river will send them down with a large quantity of dust, for they are in a place that has long been thought to be very rich. Below town the Chinese are taking out large quantities of dust, and there are thousands of them at work. In one claim the receipts each month are not less than \$15,000, while it may come nearer \$20,000.

### Early History of the Overman Mine.

The testimony of John Overman, one of the original locators of the Overman mine, has been taken before Judge Rising, of the First Judicial District Court of Nevada. This was done at the instance of the Overman company, Mr. Overman having come from Iowa on purpose to testify. His deposition is now on record and is as follows:

The Overman claim was located about the 9th of September, 1859, in the Gold Hill mining district. The locators were John Overman, William Brink, A. B. Hoover, and J. M. Overman, son of John Overman. The northern stake of the claim was placed at the southern boundary of what was known as E. E. Belcher & Co.'s claim. Each locator claimed 300 feet, and the claim consisted of 1,200 feet. Work was commenced 10 or 15 days after the location. The claim was located as the extension of the Crown Point and Belcher ledge, and all the work done on the claim by the locators was with the view of developing the Crown Point ledge. Work was commenced about the 15th of September by starting a tunnel, which was at first called the Emigrant tunnel, and afterward the Overman tunnel. When it was sold to the Hawkeye company it was called the Hawkeye tunnel. A shaft was sunk on the boundary of the Belcher and Overman, each party of the locators paying half the expenses. Up to June, 1863, the tunnel had been run into the mountain about 700 feet.

At the time of the location of the Overman ground there were no other claimants to the ground and no conflicting claims. The Overman company never abandoned their location or relinquished possession of the same. John Overman held his interest in the claim until July, 1863. The notice of location was recorded in Gold Hill, and a true copy is annexed to this testimony and marked "Exhibit A," as follows:

#### Notice.

We, the undersigned, have this day staked up notice on a claim on the 9th September, 1859, 1,200 feet south of E. E. Belcher & Co.'s claims—his claim being south of Crown Point. Three hundred feet to the share on this lead.

JOHN OVERMAN,  
WILLIAM BRINK,  
A. B. HOOVER,  
JOHN M. OVERMAN.

Recorded 7th October, 1859.

EDWARD MORSE, Deputy Recorder.

While running the Hawkeye tunnel some quartz was struck which was not thought to be the Crown Point ledge, but was believed to be the Ne Plus Ultra or Cedar Tree ledge, which were believed to run east of the Crown Point ledge.

The Cedar Tree, Hit or Win and Ne Plus Ultra claims were east of what the Overman locators considered as their ledge; while the Hawkeye ledge was 300 to 500 feet west of what was considered as the Overman ledge.

In 1863 deponent sold his interest to Caldwell, Crane, Gossage, Head and others, and retained an interest of 10 shares, which was sold after his departure.

Deponent was born in Wayne county, Indiana, and is 61 years old; a farmer, and has resided in Vapello county, Iowa, since 1863. Himself and co-locators were in the exclusive possession of the entire Overman claim from the time of its location until June, 1863.

During the first 90 days after the location the tunnel was run about 160 or 170 feet, the work being then worth from \$5 to \$7 per linear foot. Up to 1862 the tunnel was extended about 500 feet.

Down to 1862 the original Overman, or Hawkeye tunnel, was run about 500 feet. The tunnel near Pedarbridge's slaughter house was begun in the spring of 1862, and work carried on until June, 1863. The distance run was about 700 feet, at a cost of five to seven dollars per foot.

Deponent recently examined the locality of the Overman claim, to find out the north and south lines of the claim, the locality of the old Segregated Belcher or Apple shaft, and the locality of the two tunnels, of 500 and 700 feet in length, previously mentioned. A map herewith annexed as "Exhibit B" is correct, so far as the Hawkeye tunnel, the Overman and the north stake are represented thereon. As to other points on the map he cannot say whether or not they are correct.

The Overman notice was posted east of the Segregated Belcher shaft, at about the distance designated on the map. The notice was posted about the head of the cut. As a Mr. Kanor wanted to locate at the south boundary of the Overman, in the fall of 1860, 1,200 feet were measured off a little south of west from the Belcher line, in the low ground between the old American Flat trail and the toll road leading to Silver City, from a stake stuck at random about 200 to 300 feet west and southerly of the Dardanelles shaft. Deponent did not know in what direction the ledge ran; everybody was "going it blind" at the end, south of the Belcher.

While working in partnership with the Segregated Belcher or Apple shaft company, the joint shaft was sunk 20 to 30 feet and a cut was run into the hill some 15 or 20 feet.

John M. Overman, A. B. Hoover and William Brink, the co-locators of the Overman claim with deponent, were citizens of the United States at the date of the location. Hoover was born in Indiana and was John Overman's nephew, and 23 years old at the time. J. M. Overman is deponent's son. Brink was

a Pennsylvanian by birth and about 30 years old at the time of the location.

In his cross-examination the witness stated that during his connection with the Overman company what was believed to be the Crown Point ledge was not struck, although there was quartz struck in the Hawkeye tunnel, at a point about 175 or 200 feet west of the mouth. The south line of the Overman was not defined until the fall of 1860, when the ground was measured off and a stake planted. But two or three weeks afterward witness went down to look after the stake, but it had been removed. When the ground was measured off the ledge had not been traced. It was the south stake that was 200 or 300 feet south of the Dardanelles shaft. This shaft was not there at the time, but witness supposes, from his knowledge of the configuration of the country, that the stake was placed at that point.

Witness could now go out to the locality and come within 100 feet of the spot where the south stake was located. The shaft sunk in partnership between the Belcher and Overman was about where the Overman north stake is located on the map. The other Segregated shaft marked on the map, was commenced about the time that witness left the country, in June, 1863. The Segregated Belcher shaft was to the west.

Re-direct.—When witness placed the south stake he made no declaration, although he claimed the Crown Point ledge, wherever it might run.

### Base Metal Mines.

Among prospectors and other mining men of small means a good deal of talk about base metal mines is now heard. By base metal mines is meant such as contain ores that are a mixture of lead, iron and silver, with, perhaps, a small per cent. of gold—ores that cannot be worked by the ordinary mill process, but must be smelted. The base metal mines are about the only ones outside of the Comstock and the Grand Prize, Tuscarora, that are paying. Formerly prospectors in the eastern part of the State were all in search of mines that would yield free milling ores, and would hardly stop to look at a base metal lode; now, however, it is just the other way. The cost of transporting heavy engines, bed plate, wheels, pans, boilers and other machinery required in the construction of a mill far into the country, over sandy plains and rugged hills, is so great that it is a difficult matter to find capitalists who are willing to undertake such enterprises on the strength of any ordinary showing of ore. A base metal mine, on the contrary, requires no such heavy and expensive machinery. An engine of two or three horse power, weighing but a few hundred pounds, for furnishing the blast for the furnace, is all that is required in the start. Indeed, when ores that will pay for shipping are found, men that have no other capital than muscle may at once begin to make money. Not a few men are now working mines in this manner, sending their ores to California for reduction. In this way they soon get money enough ahead to put up a small furnace, when they are quite independent. Uncle Billy Raymond, at Lodi, and the Downey boys, four or five miles from the same place, are working their mines to a profit, though as yet they are shipping their ores to Sacramento. The ore is hauled to the railroad for \$25 per ton by teams returning from Belleville, and other places in that direction, to Wadsworth, when a car is loaded and sent over the mountains. In this way they have been clearing about \$400 per ton on the ore shipped. They ship only their richest ore, as they expect soon to have furnaces at their mines, where they have ore piled up that will pay as high as \$200 per ton. All cannot expect to find as rich mines as those mentioned, yet the chances appear to be very good for finding lodes that, with a small furnace and the labor of three or four men at mining, burning charcoal and smelting, would pay much more than wages. Miners are beginning to see this and are looking up the base metal leads which they formerly considered worthless. The limestone or base metal range certainly appears to be a better place for men of little means than is this region at the present.—*Virginia Enterprise*.

**MEANS OF PRESERVING MILK.**—At a recent meeting of the American Dairymen's Association, Prof. Caldwell, of Cornell University, read a paper entitled "Boric Acid and other Substances for Preserving Milk." Prof. Caldwell spoke of various substances for this purpose. He had tested various antiseptics for the preservation of milk, and found that boric acid was better than anything he had tried. When milk soured in from 20 to 24 hours, at a temperature of 80° Fahr. and upward, one part of boric acid added to 500 parts milk caused it to remain sweet for 50 hours. At a temperature of from 72° to 79°, one part of boric acid to 1,000 parts of milk, by weight, kept it sweet 50 hours. He applied it to milk warm from the cow, and thus preserved it twice as long as it would keep without it. No injury to the quality of the milk occurs in using one part of boric acid to 1,000 parts of milk. He stated that it was not a poisonous substance; he had taken the milk thus preserved into his own stomach and experienced no harm therefrom. One pound of boric acid to 1,000 pounds of milk will keep it sweet twice as long as it would keep without it.

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## DEWEY &amp; CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

[Established 1860.]

## The Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS, SCIENTIFIC AND INDUSTRIAL MEN.

Is now in its THIRTY-FIFTH Volume. It has ever been, and will continue to be, the aim and object of the publishers to make the Press

## A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of our editors and correspondents, to seize upon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and to place the same before our readers at the earliest day. It has been well said that

## A Newspaper is a Window

Through which men look upon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

## In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop, and can know but little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress books are necessarily slow and behind the times. It is only through papers devoted to the specialty which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a laggard in the race.

## The Value to the Community

Of such publications in disseminating important information, in checking useless and exploded experiments, and in instigating important enterprises, can scarcely be overrated. Through them the readings and observations of thousands are collected and collated, and brought directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of just the information he needs—an unbound book forever issuing but never finished.

## Nowhere in the Wide World

Is such an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

## The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here, also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world,

## Useful, Practical and Directly from the Field

Of labor. The mustiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

## Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of such help our editors will be able, during the coming months, to do more than ever in furnishing information which shall be

## Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

## Our Illustration Department

Will still always form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

## Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

## The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this have no need to be any thing more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million," and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

SUBSCRIPTION—\$4 a year, in advance. Samples free to those who will assist in obtaining subscribers.

(Continued from page 213.)

the Fox for \$5,000. This is the second heavy mining transaction we have had during the month, and it looks as if that long wished for capital, which is to develop our mining resources, is at last slowly finding its way into our midst.

**BO CHUNK.**—Arizona Miner, Sept. 21: John Ellis, of Alexandria, came in to-day, and brings cheering news from the Black Warrior. Mr. Raine went out a few days ago to commence work, and Mr. Ellis informs us that they put in that yesterday which loosened up a chunk of ore that will weigh at least 500 pounds, and that those who have examined it think it will assay over \$5,000 to the ton.

**CUSTOM MILL.**—The need of a custom mill in Prescott to work silver and gold ores has long been recognized, but no one has as yet moved in the matter of its erection. A large number of mines in all directions, and at various distances, each in itself too small to warrant the building of a mill, but all of which would furnish considerable quantities of good ore if they could have it worked here in town, where their owners, many of whom are farmers and stockmen, are obliged to come for supplies, and could load their wagons with ore, rather than bring them in empty, and thus the matter of hauling would be but nominal.

## Idaho.

**THE MINES.**—Owyhee *Avalanche*, Sept. 29: It is rather encouraging to note that business has undergone a slight improvement during the past month, with every prospect that operations will be carried on on a much larger scale during the coming winter than the past. The Knott mine, on Florida mountain, has been recently purchased by John Catalow and others. John F. Cassell, Esq., a well-known mining operator, formerly Superintendent of the Golden Chariot, arrived here on Wednesday from San Francisco. He examined the Florida mountain ledges, and it is reported that he expressed himself fully satisfied with the purchase made by Mr. Catalow, in which he and Mr. Grayson are reported to be interested.

**EMPIRE.**—At the Empire work is progressing very satisfactorily. The shaft is down a depth of 51 feet below the 7th level, and progressing at the rate of about 12 feet per week. There is every indication that an immense ore body will be encountered on the 8th level, as it is certain that two or more ledges will come together at that point, and the belief is general among competent judges that this development will be an important one.

## Oregon.

**GRAVEL.**—Oregonian, Sept. 29: On the middle fork of Cow creek there is a bed of rich gravel from 30 to 70 feet deep, and of a blue color, a favorite with miners. Water is taken from Middle Cow creek and conveyed to the diggings by a ditch six miles in length and 150 feet above them. With this head the piling away of the gravel bank will be an easy matter. The dirt prospects well from the top down.

At the Payallup mine the main tunnel is in 450 feet, and other tunnels a less distance. Two or three hundred tons of coal are ready for shipment, some of which has been exposed to the atmosphere for six months and is to-day as fine looking as it was when brought out of the pit.

At the mine just opened by Judge Tolman and others, on the middle fork of Cow creek, 40 Chinese are at work. The ditch, when completed, will be four and a half miles long. Hydraulic pipe and fixtures have been ordered from San Francisco, and everything will be in readiness within 40 days.

**CINNABAR.**—Jacksonville Times, Sept. 22: A new and immensely rich deposit of cinnabar was discovered on Beaver creek, on the ground owned by the Elkhorn quicksilver mining company, one day last week. The ledge is about 18 inches wide and is almost pure cinnabar. The company owning this mine expect to build a furnace next spring, and are confident that they have a big thing.

## Utah.

**SANDY.**—Cor. Salt Lake Tribune, Sept. 29: Some few persons here look upon the closing down of the Flagstaff smelter as the death knell to Sandy's future, but to a thinking person or any one who will look around and see for himself, he will be convinced that Sandy's future never looked better.

The Pioneer sampling mill and the Sandy sampling mill are both making several improvements to meet a large increase of business this coming fall.

When a person looks around the Mingo company's works, and sees about 100 men employed in tearing down and building up, with a view of extending their works from two stacks to four, and erecting large roasters, and new engines with double the power, and many of the latest improvements, the skeptical one will be convinced that the men who are doing this at a large outlay of money, know what they are about, or they would not undertake it. When these improvements are completed, a large number of men will necessarily be employed, and those who look forward to see dark days for Sandy will have to stand aside for the go-ahead men we have amongst us.

**STOCKTON.**—Our little camp is already awakening from the long night of business depression, and we feel confident that soundings have been found at last, and better times are in store for winter season. In addition to the few mines that have been worked this summer, several more have started up within the last few days, and the hardy miners are rolling out the argentiferous regardless of the low price of lead.

## New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

**THE WHITE LEAD M. Co.**—Sept. 29th. Location: Gold Hill, Nevada. Trustees—D. L. McDonald, A. Kohler, C. Shad, B. L. Schmidt and P. J. White. Capital, \$10,000,000.

**THE CHRISTY M. & M. Co.**—Sept. 29th. Location: Humboldt, M. district, Washington county, Utah. Trustees—O. P. Griffin, W. H. Graves, John H. Wise, W. M. Lubbock. Capital, \$3,000,000.

**THE DIANA G. & S. M. Co.**—Oct. 3d. Location: Elko county, Nevada. Directors—F. M. Smith, L. W. Crane, C. M. Peck, J. W. Hussey and M. D. Howell. Capital stock, \$10,000,000.

**THE TUSCARORA CON. M. & M. Co.**—Sept. 29th. Location: Tuscarora M. district, Elko county, Nevada. Directors—M. Mayblum, A. Fiesbacher, S. B. Palmer, J. F. Schafer and J. S. Doe. Capital Stock, \$10,000,000.

The capacity of the California battery mill, at the C. & C. shaft, is being increased by the addition of twenty stamps. The work will be completed in about 30 days. At present 60 stamps are employed crushing 350 tons of ore per day. When the additional stamps are started up the crushing capacity of the mill be 460 tons per day.

The first United States' patent was issued to Samuel Hopkins, on July 14th, 1790, "for making pot and pearl ashes." Up to 1836, 46 years, 10,301 patents were issued, and to date over 195,000. The annual number of patents granted is about 14,000. The annual receipts of the Patent Office are about \$800,000, and expenditures \$660,000.

The San Francisco mint coined in September \$4,516,000, of which \$1,275,000 was trade dollars, \$108,000 in halves, \$110,000 in quarters and \$3,000 in dimes. The sum of \$3,020,000 was in twenty-dollar pieces.

## Save the Salmon.

The daily papers for a week past have been laden with articles to show that the laws for the preservation of salmon during the breeding season were being transgressed by the canning factory at Collinsville. The matter was brought up first by the Antioch Ledger, two or three weeks ago, and though there has seemed to be a general impression that the factory was being run with unlawful catch, there was difficulty in getting evidence upon which to arrest the owners of the cannery. After the agitation in the newspapers began, the owners of the cannery, Emerson Corville & Co., were arrested at the instance of the Fish Commissioners and the hearing of the case postponed until Saturday of this week.

The matter is enwrapped in some obscurity, although there seems no doubt among those who have facilities for knowing that the wrong has been done. The Bulletin has examined the question and the effects of the illegal practice, and writes as follows: "The District Attorney of Solano county, assisted by special counsel employed by the Commissioners, will conduct the prosecution. The case is a plain one against the offenders. They have thus far made no effort to deny that they are engaged in this unlawful business. The penalty ought to be the heaviest that the law provides. No trifling penalty will be satisfactory. It is estimated that these men have already destroyed over 50,000 seed salmon on which the future of the California salmon fisheries in a great measure depended. They have gone in to make a fortune through the violation of a law which honest men have respected. The penalty ought to be commensurate with the magnitude of the offense. The Fish Commissioners have unselfishly devoted their time for the past five years in stocking the streams of California with fish. They have done this without remuneration. Their labors were this season hearing fruit. It is the first year since the artificial hatching of salmon was begun that the run of fish up the Sacramento has been large enough to justify the erection of canneries. By natural breeding, only about 5% of the ova of the fish is hatched, while from 95% to 98% is the result of artificial breeding. If the fish are allowed to run to the spawning grounds during the spawning season, the supply may be perpetuated through the agency of the hatchery on the St. Cloud. The law providing for the suspension of fishing during three months of the year, commencing August 1st, was framed to suit the wants of the fishermen. A conference for that purpose was held before its passage, between the Senate Committee, the Commissioners and a number of leading fishermen. The law as it now exists was the result of that conference."

We print a statement which is ostensibly written in the interest of the fishermen and giving their view of the law. We are not experts in the matters involved, and do not attempt judgment on some of the points, but we believe fully and earnestly in the wisdom of giving the fish a chance to reproduce their kind, for it is a plain fact of experience along all rivers that the best fish may soon become wholly destroyed by constant and ungodly taking of them. We notice that one of the Commissioners, Mr. Redding, of Sacramento, has written a letter to the Commercial News, which controverts some of the positions taken by our correspondent, to whose letter we have alluded. We quote: "When the fish first come in from the ocean, they are of a superior flavor and quite fat, and showing a layer of white curd between each layer of flesh. As the salmon does not eat in fresh water after it comes in from the ocean, the eggs and milt are matured at the expense of the fat and muscular vitality of the fish. Soon after the first of August the eggs and milt mature, the white fat and curd disappear, the silvery scales are absorbed, and the skin turns black. It is then as unfit for human food, and as feverish, as a hen would be taken from her nest. The canneries on the Columbia river cease work on the first of August, as it has been found that salmon canned after that date have so deteriorated as to injure the reputation of the whole season's catch in foreign markets. It is reported that canneries on the Sacramento have been at work catching and canning over-ripe fish since the first of August. The effect will be to reduce the reputation of the Sacramento salmon to second and third-class. It is unfortunate, as this is the first year these fish go extensively into foreign markets, and great care should have been taken that only perfect fish, not over-ripe, should have been sent abroad from the Sacramento. It is to be hoped that next season the canneries will repair their error, by catching and canning only during the season, when the fish are in perfect condition, and during the time when proper and wholesome laws provide they may be caught."

## The Fishermen's Statement.

**EDITORS PRESS.**—Your representative called on me on the 26th ult., and requested me to forward you my views and experience relating to the salmon law in this State, as you were desirous to ventilate the question, and through your columns enlighten the masses on this important subject. Gents, I have canvassed the fishermen in this immediate neighborhood, and should you publish this, you are authorized to state that it embodies the views of all the fishermen on the upper Sacramento river.

The salmon law, making August, September and October close months, was framed in evident ignorance of the habits of the fish and the manner of taking them.

1st. The nets used in this river are of a uniform size mesh, viz., eight-inch. There is no law as to nets here, but a net that would hold a five-pound fish would be too small to admit a 12-pound fish, therefore the eight-inch mesh has been adopted as best fitted to catch the average sized fish, 16-pound, and no fish under nine pounds in weight or over 30 pounds can be caught in it. Thus we allow over one-half the fish to escape our nets altogether.

2d. As the fish only come in the river to spawn, the close time should properly be when the spawn is ripe; but there are two distinct kinds of salmon in this river, which leave the sea at very different times. The first run lasts from March until the end of July, and is left to the mercy of the fishermen altogether. The later run is from about August 15th until October 20th, and is a fish with a marked hooked jaw—the under jaw receding like a pig's. It has a long head, and more spots on it than the first run. We call it the hook-mouth, or black salmon, and it has never been seen in the river before August. Thus it will be seen that it is only this variety that is at all preserved by the law, and, in consequence of the current being so slack, and so little water in the river, it is very difficult to catch this fish at all. The meat of this fish is much harder and finer than the early salmon.

The month of July, and that alone, is the proper close month, as then the spawn of the main body of fish is ripe, and, the weather being so warm, the fish is soft, and not fit either to salt, can or eat, but, as the river is so shallow, and there are so few good drifts where we can catch the fish, there is no necessity to preserve the fish at all. People have been saying that there was a scarcity of fish this year; granted, but it was entirely on account of the drought. The fish could not get up the river; there was not enough water for them all, as each fish requires sufficient water to furnish it food. I am only a fisherman, and not scholar enough to put my knowledge of this subject in a scientific article, but my knowledge comes from 20 years' practice. In behalf of 50 salmon fishermen of the Sacramento river. T. T. WILLIAMS.

**LADY BRYAN.**—A meeting of the dissatisfied stockholders of the Lady Bryan mine was held on Saturday evening in the Fourth District Court-room. Dr. H. S. Stone occupied the chair, and Mr. Gardner acted as Secretary. The Chairman explained that a suit had been brought against Dr. Sigesmond to recover possession of 14,500 shares of stock belonging to the dissatisfied members and placed in his (Sigesmond's) hands as custodian, with four others, to take action against the management, and which he now refuses to return. It was also stated that the Lady Bryan stock had been withdrawn from both the San Francisco and Pacific Stock Boards, and that the mine had been banded for \$130,000 by John Tyler, Jr., who was anxious to obtain possession of the stock. A notice, signed by S. B. Sigesmond, was read, stating that the certificates of stock held by him had been levied upon out of the Nineteenth District Court in an action commenced by Dr. Stone, and recommending the stockholders take such action in the matter as they pleased. As Dr. Sigesmond had not handed over the stock held by him, in compliance with a resolution at the last meeting, it was moved by Dr. Keitz that he be expelled from the meeting for contumacy. The motion was carried, and Sigesmond left the room amid considerable confusion. On motion of Mr. Stone, it was resolved that all the parties who held Sigesmond's receipts for stock take them to the Secretary and have them exchanged. The meeting then adjourned.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: California, Sept. 26th, \$208,672.08—total to date, \$875,794.36; Standard, Sept. 25th, \$41,589.65; Northern Belle, Sept. 23d, \$10,575.13; Leopard, Sept. 25th, \$5,000; Northern Belle, Sept. 27th, \$9,094.65; Arizona, Sept. 29th, \$1,492.85; Northern Belle, Sept. 25th, \$8,953.74; Minnetta Belle, Sept. 28th, \$2,000; Raymond & Ely, Sept. 20th, \$7,291.99; Endowment, Sept. 29th, \$2,991.60; Con. Virginia, Oct. 1st, \$222,386.99; California, Oct. 1st, \$296,662.53; Martin White, Sept. 23d, \$6,583.79; Northern Belle, Sept. 30th, \$11,557.96; Arizona, Oct. 1st, \$3,923.92; Leopard, Oct. 3d, \$3,500.

Most of the finest buildings in San Francisco owe their origin to the mines. The Palace hotel, Baldwin hotel, the Nevada block and the new Stock Exchange are probably four as fine buildings as there are in the city and each of them was built with Comstock silver and gold. These are only a few of those which could be mentioned in this connection.

It is reported that the Leeds mining company will probably increase the dividend this month. The ore is improving in value, and the supply is unlimited. More pans will be put in with an auxiliary engine.

**ALBERT A. HICKOX**, a stock broker of this city, filed a petition in bankruptcy in the United States District Court yesterday. His liabilities are set down at \$27,073.58—assets \$2,757.69.

## Book Notices.

**WEEKS ON MINERAL LANDS.**—Since the publication of Gregory Yale's work on "Mining Claims and Water Rights," in 1867, we have had no extended treatise on this important subject. The compilation of Mr. Skidmore and Mr. Copp, though both are useful, do not attempt any comments or explanations of the laws of mines. Mr. Weeks' treatise is a systematization and condensation of the materials which constitutes the law relative to the mineral lands of the United States from the date of the first mining Act in 1866, to the present. These materials consist principally of the various Acts of Congress, the Revised Statutes of the United States, the decisions and resolutions of the Commissioner of the General Land Office and Secretary of the Interior, the opinions of the United States Attorney Generals, and the decisions of the courts on the subject. It embraces full discussions of the following subjects: 1st, Introductory. The Legislation of 1866 and its interpretation. 2d, Reservations and Exceptions of Mineral Lands. 3d, Rights of Exploration and Purchase (herein of Citizenship, Corporations, etc.). 4th, Dimensions of Claims, Location, and Possession under the Acts. 5th, Tunnel Rights. 6th, Regulations, Expenditures, Improvements. 7th, Patents. 8th, Adverse Claims. 9th, Placer Claims. 10th, Surveys. 11th, Intersection of Veins. 12th, Mill Sites. 13th, Water and other Vested Rights. 14th, Homesteads and Town Sites. 15th, Segregation of Mineral and Agricultural Lands. 16th, Coal Lands. 17th, General Power and Authority of the Land Department, Appeals, Evidence, and various miscellaneous topics. The book is intended more particularly for the use of lawyers; is bound in "legal calf," and published by Sumner Whitney & Co., in this city. It is the most valuable treatise on the subject we have, bringing everything up to the present time.

**PROF. HAYDEN'S ANNUAL REPORT FOR 1875.**—This is the ninth annual report of the U. S. Geological and Geographical Survey of the Territories, embracing Colorado and parts of adjacent Territories, being a report of progress of the exploration for the year 1875, by F. V. Hayden, U. S. Geologist. This volume completes the southern and southwestern portions of Colorado, and includes a belt 15 miles in width of northern New Mexico and eastern Utah. The force of the survey was divided into seven parties. The areas for exploration were further from the base of supplies than heretofore, rendering the labor greater, but the amount of topographical and geological work accomplished has not been exceeded by any previous year. The report comprises more than 800 pages, and contains a great deal of valuable information not otherwise available. The delay in the publication of the annual report for 1875 has been produced by causes beyond Professor Hayden's control. The great increase of labor incident to the Centennial Exposition drew away much of the force that would otherwise have been expended in the preparation of reports. The annual report of 1876 will follow the present one in a few months.

**USE OF BELTING.**—This is a treatise on the use of belting for the transmission of power, by John H. Cooper. The book contains numerous illustrations of approved and actual methods of arranging main-driving and quarter-twist belts, and of belt-fastenings. Examples and rules in great number for exhibiting and calculating the size and driving power of belts; plain, particular and practical directions for the treatment, care, and management of belts; descriptions of many varieties of belting, together with chapters on the transmission of power by ropes; by iron and wood frictional gearing; on the strength of belting leather; and on the experimental investigations of Morin, Briggs and others for determining the friction of belts under different tensions, which are presented clearly and fully with the text and tables unabridged. The book is written in the plainest language and is exhaustive in character, being, indeed, worthy of a place in every workshop in the country where belts are used. The publishers, Claxton, Remsen & Haffelfinger, 628 Market street, Philadelphia, will send copies by mail, post paid, for \$3.50. The book comprises 310 pages, and is copiously and minutely indexed.

**THE CHEMISTS MANUAL.**—This work is a practical treatise on chemistry, qualitative and quantitative analysis, stoichiometry, blow-pipe, analysis, mineralogy, toxicology, etc., by Henry A. Mott, Jr., E. M., Ph. D., (Van Nostrand). This work will serve as a useful reference book for the general scientific readers, and possesses a special value for the students and laboratory worker. It contains a judicious selection of the most important methods, most of which have been tested by laboratory experience and found to give satisfactory results. These are presented in a concise form with reference to original authors. The numerous table of constants will also be found of great value. The author has accumulated from time to time a large number of valuable notes and tables which he now publishes; so that all the matter has practical value attached to it. A copious and well arranged index is presented, so the work forms one of ready reference. Everything is in a very condensed form and the work is really a valuable one for those interested in any way in chemistry. For sale by Bancroft & Co.

## General News Items.

THE Patent Office fire was entirely accidental. There is no proof whatever of an incendiary attempt.

THE property left by Thiers, besides his library and objects of art, which are left to the State, is estimated at about \$2,700,000.

THE Secretary of War, in his annual report, will recommend that the army be increased to 40,000 men. The English battalion system will also be recommended.

DIVIDENDS were paid by local incorporations last month to the amount of \$2,963,000. The October disbursements will probably be still larger, as some quarterly dividends are to come into the account.

CHARLES CROCKER, the railway magnate, has suggested an excellent method to provide temporary work for the unemployed. He has offered to be one of 50 to subscribe \$1,000 each towards building a new two-mile drive in Golden Gate park.

On the 30th ult., the regular passenger train crossed the new bridge over the Colorado river, landing the United States mails, passengers and express on Arizona's soil. Hereafter all trains will arrive and depart from the depot in Yuma instead of via the ferry, as heretofore. The change is hailed with joy by all, as the transfer by ferry was very annoying as well as expensive. It is generally believed that the company will soon commence the construction of the road up the valley of the Gila, thus developing the opening of the rich mines in the interior of the Territory.

THE INFLUENCE OF THE CENTENNIAL.—We have already noted the spirit of increase and activity which was breathed into many branches of our manufacturing industries by the display given to our goods at the Centennial. It is gratifying to California agricultural producers to learn of movements in other lines in which they are more directly interested. The following note is from the Philadelphia Bulletin: American wines are being exported in considerable quantities since the Centennial exhibition. Foreigners were surprised at the progress made in viticulture in this country, and the superior quality of many of the American wines on exhibition, particularly those of Ohio, Missouri, New York, New Jersey and California. Hardly any article of American production of a superior quality was on exhibition at the Centennial which has not since been exported abroad.

EASTERN OUTLOOK.—The St. Louis Journal of Commerce says: The people of this country are certainly not in danger of actual starvation. The granaries of the West are overflowing. Fat cattle and fat hogs come after full corn cribs. The oyster men of the East unite in saying that for years there has not been so good a prospect for an abundant supply of oysters, and it is said they will be fine in quality and cheap as to price. We can trade corn and wheat for oysters and things, and worry the winter through right comfortably.

METEOROLOGICAL SUMMARY FOR SEPTEMBER.—The report of the U. S. Signal Service officer, of San Francisco, for the month of September is summarized as follows: The mean height of barometer for the month was 29.92; mean temperature, 61°; mean humidity, 71; prevailing winds southwest; highest barometer, 30.114; lowest, 29.775; highest temperature, 92°; lowest, 51°; monthly range, 41°; greatest velocity of wind, 24 miles per hour; total number of miles traveled by wind, 6,939.

Mr. J. W. Mackay, of the bonanza firm, has returned to the Comstock from Paris, where he has been with his family for the past five months.

In the suit of R. F. Knox vs. the Great Western quicksilver mining company judgment has been given for plaintiff.

## To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

## PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this act at short notice.

DEWEY &amp; CO., Publishers.

## Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ore, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kirochich's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, F. E. berg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator and, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnaces building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tallies and setting tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,

Howard between Fremont and Beale Sts., San Francisco.

**Machinery.**

**THE O'HARRA**

**CHLORIDIZING FURNACE**

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—24 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61½

In a furnace of three or four times this capacity the  
cost is reduced by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by pur-  
chase from me, are hereby cautioned against using, or  
making, or selling any device for turning the discharge  
pipes of hydraulic machines which uses the deflecting  
force of the stream of water.

Any such device is an infringement of United States  
Letters Patent, granted to me on the 16th of May, 1876,  
and re-issued September 10th, 1876.

I have commenced suit against Richard Hoskin for in-  
fringing my said patent, and intend to prosecute all par-  
ties using such Deflectors without license from me, there  
being no other way to protect my rights.

Any parties wishing to purchase the right to use this  
device can do so by making application to me.

**HENRY C. PERKINS,**

North Bloomfield Nevada County, Cal.

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT  
for DIAMOND POINTED DRILLS, now brought to the  
highest state of perfection, are prepared to fill orders  
for the IMPROVED PROSPECTING AND TUNNELING  
DRILLS, with or without power, at short notice, and  
at reduced prices. Abundant testimony furnished of  
the great economy and successful working of numerous  
machines in operation in the quartz and gravel mines  
on this coast. Circulars forwarded, and full infor-  
mation given upon application.

**A. J. SEVERANCE & CO.**

Office, No. 320 Sansone street, Room 10.

## San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER.

Several first premiums received  
for Quartz Mill Screens, and Per-  
forated Sheet Metals of every  
description. I would call special  
attention to my SLOTT CUT and  
SLOTT PUNCHED SCREENS,  
which are attracting much at-  
tention and giving universal  
satisfaction. This is the only  
establishment on the coast de-  
voted exclusively to the manu-  
facture of Screens. Mill owners using Battery Screens exten-  
sively can contract for large supplies at favorable rates.  
Orders solicited and promptly attended to.

32 Fremont Street, San Francisco

## San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of  
the latest and most improved kind, and are again prepared  
to fill orders for Rope of any special lengths and sizes. Con-  
stantly on hand a large stock of Manila Rope, all sizes;  
Tanned Manila Rope; Hay Rope; Whale Line, etc., etc.

**TUBBS & CO.,**

611 and 613 Front Street, San Francisco

## MINING CLAIMS IN MONTANA.

Some good mining claims near Sheridan, Montan  
Territory, can be purchased at present on very favorable  
terms. Positive information can be obtained by address-  
ing

**D. B. NOBLE,**

Sheridan, M. T.

## ARITHMETIC MADE EASY.

## ROPP'S EASY CALCULATOR

Is a new publication that must prove of incalculable  
benefit to Farmers, Mechanics and Business Men. It is  
so rapid and original as to startle the most scholarly,  
and yet so simple and practical that the most illiterate  
in figures can instantaneously become his own account-  
ant. It enables thousands to accomplish in a minute  
what they could not learn to calculate in many months.

The first part contains an entirely new system of tables,  
which show at a glance the exact value of all kinds of  
Grain, Stock, Hay, Coal, Lumber, Merchandise, etc.,  
from one pound up to a car load, and for any price that  
the market is likely to reach; the interest on any sum for  
any time at 6, 7, 8 and 10 per cent; correct measurement  
of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Gran-  
aries, Bins, Wagon Beds, Corn Crib; a Time, Wages  
and many other valuable tables.

The second part is a practical arithmetic, and embodies  
a simple mechanical principle which enables any one  
familiar with the fundamental rules to become a light-  
ning calculator; and by which over two-thirds of the fig-  
ures and labor required by the ordinary methods, and  
fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well  
and elegantly bound in pocket-book shape and is accom-  
panied by a Silicate Slate, Memorandum and Pocket for  
papers. It is by far the most complete, comprehensive  
and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on  
receipt of price, by P. O. order, registered letter or  
receipted by express. Address

**DEWEY & CO., San Francisco.**

We have the best Imitation Gold Watch in the Market for Trading  
Purposes. The metal is a composition of other metals, so closely resembling  
big gold that the best judges find it difficult to detect the difference, except by a  
chemical test, and it has the virtue of being  
inexpensive to make it the best substitute  
for gold known. GENUINE AMERI-  
CAN MOVEMENT, EXPANSION BAL-  
ANCE, BEAUTIFULLY ENGRAVED OR  
ENGINE TURNED HUNTING CASES,  
and equal in appearance to a COLD  
WATCH THAT COSTS FROM  
\$150 TO \$200. It sells and trades  
readily, for from \$60 to \$100, and if you  
wish a watch for your own use or to make  
money on, try this. Owing to our large  
sales, we are enabled to reduce the price  
of them to \$12 each with an ele-  
gant Chain attached. They are used on  
Railroads, Steamers, and in Manufactories, and  
other places where accurate time is required,  
and gives general satisfaction. We send them  
by Mail or Express, on receipt of \$12, to any  
part of the Country, or it will be sent C.O.D.  
when the customer desires and remits \$3 in ad-  
vance. These Elegant CHAINS weigh about  
Fifty Pennyweights, and the same pattern in  
pure gold would cost \$100. We sell these Chains  
at \$3 each. But we will send the Watch and Chain for  
\$12, sent by Mail in a Registered Package, post-  
paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

DEWEY & CO.

HARD ON THE PUBLISHERS.—Some of our subscribers when called upon by our agents insist that they have sent us notices through (perhaps) a neighbor, the postmaster, or a letter, and we have taken no notice of their orders; for which they feel hard towards us. Now, we never received such notices without responding to them. It would be suicidal to our interests to ignore them. The fact is that it too frequently happens that people misdirect their letters; too frequently forget to put the right (or any other) kind of stamps on their letters; they too often send a copy of the paper back, which may never reach our business office, or if it does reach us, may lack the name of the town and county in which the subscriber lives, in which case we cannot (if we have his name) tell what part of our list to find it, to cross it off or change it, without looking over some 10,000 names. Postmasters and their clerks make omissions and mistakes as well. When you have business with this office remember postal cards and letter stamps are cheap, and ask no one to do that which you can well do yourself.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia, & 59 Gold St., Cor. Ann. N. Y.

## Straw and Corn Cutting Machines.

The advanced state of agriculture has produced a demand for improved machinery and appliances, by which the preparation of feed and the cost of raising stock can be reduced to a more economical system. Hence it has been the study of numerous inventors how to construct a machine for cutting hay, straw, etc., in a first-class manner, and in combination will reduce even corn stalks and the coarse material usually found in feed, fine enough for all kinds of stock to eat, requiring that class of feed, and that the machine will not destroy the tender parts while reducing the coarser portion to a proper degree of fineness. That the machine will not be cumbersome and too complicated in construction, as well as to be too difficult to keep in running order, and too laborious to operate; to perform these several operations at once, also that it will meet the wants of all requiring that class of machinery, such as paper manufacturers, collar makers, egg packers, stock breeders, dairymen, farmers, liverymen, and numerous others.

The machines illustrated on this page, manufactured by J. Dick & Bros., Canton, Ohio, embrace the foregoing requirements in practical form:

Fig. 1 is a fair representation of the No. 1 Dick's superior hay, straw and cornstalk cutter and splitter, arranged for horse or steam power. It has a pulley on the main shaft to receive a belt. It will cut from 3,000 to 5,000 lbs. per hour, according to the material and length of cut. It has two sets of feed rolls and two boxes. It is so arranged as to cut on both sides of the main shaft; by this device the knives cut from two boxes instead of one. This machine cuts 19 inches wide and three inches thick, with 12 inches long. The cut can be changed to eight different lengths, between one-quarter and one-eighth inches. The shear plates are made adjustable, and are independent of the working parts. In case of wear they can be readily taken out and ground and are easily replaced and adjusted. All the working parts are encased, to prevent straw, etc., from getting in contact with the machinery, also to guard against accident. The encasing is all independent of the frame of the machine and can be readily removed if desired. This machine is built with two or three knives as the purchaser may wish.

Fig. 2 gives a perspective view of the machinery and the arrangement of folding the feed boxes over the machine. Each of the feed rollers are set, driven independent of each other by endless space chains, so as to give them perfect freedom in adjusting themselves to the irregular thickness of material passing between them. In the cutting of corn stalk, especially with the ear on, it is difficult to feed even thickness, as it often happens that on one end of the feed roller several corn stalks and ears of corn will pass between them, at the same time on the other end of the roller will be comparatively nothing. By this device of driving the feed rolls, the machine cannot be injured by over feeding. The tension springs that give pressure to the feed rollers are made of tempered steel and are mounted underneath the feed roller, pressing on the center of cross-bars. These cross-bars are hinged to iron rods which are connected with the bearings on each end of the feed roller; by this arrangement the ever-changing position of the rolls is not interfered with by the tension springs. The feed gears are made interchangeable and can be changed *vice versa*. By this device a great many different lengths of cuts can be made with but few wheels. All the working parts are made to take up in case of wear. The feed gears are provided with a new plan for keeping them lubricated; the oil is applied through the center of the bearings, and cannot go to waste unless passing through the bearings first and performing its duty.

Figure 3 gives a view of the fly wheel as constructed for all the machines, hand and power, of different sizes. This wheel is mounted on the main shaft; on this shaft is mounted the driving pulley and the bevel pinion that gives motion to the feed gears. On the fly wheel is placed the whole cutting apparatus—

the knives, two or three in number, as the case may be, is supported on adjustable supports. These supports are provided with inclines or clutches and are made to revolve on similar inclines on the spokes of the fly wheel. By partly revolving these supports the knives can be adjusted to or from the shear plates, as the case may require, and firmly secured in their proper position by two strong bolts passing through each knife, the supports, and the arm of the fly wheel. The knives are straight blades. This form of knife is readily adjusted and easily kept in order.

Fig. 1, Dick's Straw and Corn Stalk Cutter and Splitter.

Preceding the cutting knives are a series of steel blades, arranged on curved bars. These blades are set closely to each other so as to cut, split and crush corn stalks, ears of corn, and all coarse material into minute particles. These blades operate at a right angle, or nearly so, with the cutting knives, and are arranged in curved lines from the main shaft. By this device the blades precede each other and will operate easy, and cannot clog up so as to prevent

Fig. 2, Perspective View of the Mechanism.

them from performing this work. For cutting hay, straw, etc., these splitter bars are not required and can be readily detached by loosening two bolts in each bar, thus leaving only the cutting knives attached to the fly wheel. The main bearings are filled with babbitt metal in all the machines, and can be readily refilled in case of wear.

The Water Commissioners have decided to recommend the Blue lakes scheme for supplying San Francisco with water.

## New Mining Districts.

At a meeting of miners at Royal City, on the 25th ult., it was unanimously agreed on the vote of the miners to segregate that district from Bristol district, the new district to be called the Jackrabbit mining district. The boundaries of the Jackrabbit mining district to be bounded on the southeast by the Highland mining district, on the northwest by the Last Chance district, on the south by the summit of

the mountain to the valley. This district is in Lincoln county, Nevada, and has lately attracted considerable attention.

Fine Gold Gulch district has been formed at Fine Gold Gulch, 35 miles northeast of Borden, Fresno county. C. E. Strivens has been elected Recorder. The boundaries of the district are as follows: Commencing at John Williams' ranch; thence west to Harbert's mill; thence in a westerly direction to Johnson's ranch;

Fig. 3, The Fly Wheel.

thence to the San Joaquin river; thence up the San Joaquin river, following the meanderings of the stream, ten miles, and from thence northerly to the place of beginning.

THE Los Angeles *Republican* says: Captain Kraszynski, of Andrew station, informs us that on Friday last the well on the Pico district known as "Pico No. 2," struck oil at a depth of 200 feet, and at last accounts was flowing 300 barrels per day.

## The Hayden Surveys.

The work done by the Hayden Geological and Geographical Survey has been probably better appreciated by the people at large than any similar work ever done in the United States. As a general thing the public seems to be opposed to the expenditure of public moneys for things of this kind, for the results attained do not seem to the average mind to be commensurate with the expense. Of course this conclusion is erroneous, as any well-informed person knows. However, in this case, the survey has been, and is, very popular with all classes of people, and the reports have been properly appreciated by all. To scientific men they are of deep interest as the sections of country examined by the survey have been entirely new, and the discoveries important. The publications have been issued in first-class style and are satisfactory in every respect. To show how the work of the survey is appreciated abroad we publish the following extract from a letter from J. Barrande, the eminent paleontologist of Prague, Bohemia, to Professor F. V. Hayden, the chief of the survey:

In 1876 I received of you a series of various publications, for which I beg you to accept my warmest thanks. Among those publications there are two which are especially distinguished by their extent and the accompanying illustrations. One is Mr. Meek's last work on the invertebrates of the cretaceous and the tertiary formations of the upper Missouri; the other is Mr. Cope's work on vertebrates of the cretaceous lands in the West. These two magnificent quarto volumes give the measure of the grand plan which is to immortalize the work of your United States Geological Survey of the Territories.

You have laboriously and successfully conducted that survey over an immense area, and you continue to do it with an equal success in the co-ordination and the publication of the incomparable mass of observed facts. I am happy to have the chance to express to you my congratulations for this double success.

The beauty of the plates and the typographical luxury of your two large quarto volumes honor the artists of your country, and contribute to ennobling the monument erected by you to science. That monument will testify that the supreme legislature of the United States, by exercising a sovereign munificence in the name of a great nation, well understands that a narrow parsimony would be very much out of place and show very little patriotism in regard to securing a national glory. After all, pacific glories of science cost much less than bloody laurels, and secure more desirable sympathies among other nations. Honor to your intelligent legislators! The day will come when they will show you more positively their gratitude.

HALE & NORCROSS.—The total expenses of running the Hale & Norcross works, underground and on the surface, for the month of September was \$16,820.13. There were consumed for running the pumping engine alone 521 cords of wood, or an average of 17½ cords per day; in all 655 cords were consumed. On the 1st instant there were on hand at the works 1,061½ cords of wood. The number of days' labor performed was 1,464½; and the average wages per day was \$4.41½. During the month the pump was stopped 47 hours and 16 minutes, or one hour and 34½ minutes per day. The pump made 299,420 strokes during the month, being an average of 6 97-100 per minute, and hoisted 14,976,000 gallons of water.

The mine owners of Gold Run have concluded to discharge all the Chinese in their employ, and work their mines in future exclusively with white labor at reduced wages. The wages paid miners to be \$35 per month, and furnished with board and sleeping apartments. It is said Mr. Stone, Superintendent of one of the Gold Run mines, is now working the men he employs on this lay-out, and the miners working the Hayward mines at You Bet are hired on the same terms.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Notes from the Mountains.

EDITORS PRESS:—The country for 14 miles from Stockton, on the Copperopolis road, is, I think, a portion of the best in the State. The soil is adobe, and, judging from the crops I have seen, it must be rich. But, after striking the sand plains the only product of the soil seems to be gravel stones. At Telegraph City, where there is a population of one family, we enter the mining region. The gulches which used to yield the "dust" and echo in response to the gold-seeker's clamor are now still, and the sound of the pick, shovel and pan are heard no more. A few miles more brought us to Thos. McCarty's place where we stopped for the night. Mr. McCarty is one of the old pioneers, and one of the first locators of copper mines in this section. In the morning we had the pleasure of riding to Copperopolis (four miles) behind a five-horse team.

The copper mines of this place once gave employment to about 800 men. But now, as the strangers wander about the place the stillness seems greater than that of a New England Sabbath. The coming of the daily stage, between Milton and Sonora, caused the usual excitement, and after horses had been changed, and the Union hotel table unloaded, we took our seat with the driver, Mr. Shine, on the four-horse stage for Sonora, and away we started at 12:45 P. M. That is what I enjoy, a ride up the mountains being entertained by a good driver.

Eight miles from Copperopolis we came to the Stanislaus river, which we crossed in a ferry-boat, and here we saw men engaged in river mining. Eight miles more we came to Turtle Town, where several quartz mines are located, and here also the stage horses are changed; we are in the mining country now, and as we come in sight of the old placer diggings of Springfield and Columbia they present a peculiar appearance. The earth has all been washed away from the great, gray boulders, and they look as if they were guarding some great enterprise.

Thousands of people have searched and obtained gold in greater or less quantity, but now, as we ride through on the stage, while the shades of evening fall, we only see the works of a few miners who yet linger about the places which once knew a multitude. At 5:30 we arrive in Columbia, where this is written.

I have also had the pleasure of visiting three of the quartz mines of Tuolumne county. Soulsbyville I came to first, and as I passed through the camp I noticed three new houses going up, also a new hall. The mine has been under the supervision of Mr. John Leechman for about 19 months, during which time the mill has not been idle a day for want of quartz. The mill formerly ran ten stamps, but recently five stamps have been added. Mr. Leechman is a very pleasant man, and it is through his energy and ability that this mine has become the leading mine of this county, as well as one of the first in the State.

The Ohio mine was the next. This mine is superintended by Mr. H. A. Raudall, but he being absent we were shown around by Mr. James Johnson. This mine is being opened, and if it had not been for the accident by fire of several weeks since, rock would have been taken out before this. Five weeks after the fire everything was in working order. Everything had to be rebuilt except the wheel and the lagging of the shaft.

From this mine we took the Indian trail to Confidence. This mine at present is quiet, although the pumps are kept going night and day, so the mine will not fill with water. We understand this mine was paying when they ceased working. The mill is in good repair, drives 40 stamps, and is considered to be one of the best mills in the State. Mr. Wm. Symons, the Superintendent, gave us a cheery welcome, and seems to be confident that are long the Confidence mine will make things lively in that camp again. I hope so, for not only are the miners benefited, but the mountain ranchmen also reap a golden harvest when the mines are running. I notice with pleasure that the MINING AND SCIENTIFIC PRESS is looked upon as authority on mining matters in the mountains.

R. A. EASTON.

### Calaveras County Mines.

EDITORS PRESS:—I hope the following items from our camp will prove acceptable: The San Bruno is owned by Garland, Kellogg & Harris. Shaft, 480 feet deep; 31 men employed; about 200 tons ore on dump; taking out about 12 tons per day. The ore from this mine works about \$80 per ton. John L. Hoey, Esq., Superintendent.

Moute Cristo is owned by same parties as above; worked by tunnel, which is now in 355 feet; six men employed, and are taking out ore that shows large quantities of free gold. J. L. Hoey, Superintendent.

Good Hope belongs to the same company,

having the same Superintendent. Will commence operations on Monday next. Four men employed in getting engines and pumps in working order.

The Banner mine, formerly the Grasshopper, has recently become the property of Col. Johnson, of the Tiger mine. The Banner has a record of taking out \$18,000 in sinking 80 feet. It has been lying idle for the past six months, but has started up with a new engine and eight-inch Cornish pumps. About 20 men are employed. Col. Johnson personally superintends the works.

The Holmes mine employs eight men and is being worked by tunnel—contract work.

The Dom Pedro is owned by Peter Cass; vein is about seven feet in width; six men employed; has just finished crushing about 100 tons of ore, which paid \$13 per ton. Peter Cass is the Superintendent. The mine is a new discovery, and is only down about 60 feet. The ore taken from the mine to-day shows free gold.

The "Harryhausen" mine is a new discovery, and is only down about eight feet, but the prospects from it are very remarkable, in fact, fabulous; one bucket of rock prospected over \$40. This discovery has created a great deal of excitement in the camp. There are several other mines in this district, but of them I will write in my next.

### Garland's Mill.

This is one of the finest mills in the State, and has all the modern improvements, including Cochran's self-feeders. The mill is owned by the Garland & Kellogg Co. Harrison Longley, Esq., has charge of this portion of the company's property, and visitors to the camp are always cordially received and shown through the mill by him. The mill is now engaged in crushing ore from the Woodpecker mine.

### Mosquito Gulch.

Lies about 10 miles west of Mokelumne Hill, on the West Point road, and at the present time is as lively a camp as any in the State. It consists of about 40 buildings of various sizes, from an 8x10 miner's cabin to a three-story hotel. Longley's hotel is adjoining Garland's mill, and is run in first-class style by H. Longley, Esq.

J. L. Hoey, Esq., Superintendent of Garland's and Kellogg's mines, is also proprietor of the only store and saloon the camp contains. He is also Postmaster and Wells-Fargo's agent, also stage agent. He is ably assisted by Col. Sam Tiffeld.

Johnny Steel, the *par excellence* of the camp, is carpenter, wagon builder, etc. Johnny can make anything from a hair pin to a gold watch.

The Briggs house is kept by Wallace Briggs, and is the "bon ton" house of the burg.

The Banner hotel, last, though not least, is kept by that old Rincon hotelman, Dave Lampson, and is the Palace hotel of Mosquito. Mrs. Lampson personally superintends the interior departments and makes her guests comfortable.

ONALED.

Mosquito Gulch, Calaveras Co., October 2d.

### Mining in Victoria.

The *London Mining Journal* has been favored by Mr. Thomas Couchman, Secretary for mines and Chief Inspector, with the Mineral Statistics and Reports for 1876. The Minister of Mines—Mr. William McLellan—remarks that the non-discovery of new areas of auriferous drift during the past year, and the want of water for sluicing operations, caused by the extreme dryness of the season, have operated prejudicially upon the yield of alluvial gold, but it is gratifying to find that quartz obtained from deeper levels of the vein mines continues to give satisfactory yields. This should act as an incentive to the further exploration of those neglected mines which gave satisfactory returns of gold at shallow levels. The Department is again indebted to mine owners, mine managers, managers of banks, and others for assistance courteously given to its officers for granting them access to their books, and otherwise furnishing information required for the compilation of the returns. Over 1,000,000 tons of quartz are included in the returns this year—the exact quantity is 1,011,808 tons 4 cwt.—which is the largest quantity of quartz yet returned in any year.

The reluctance displayed by mine-owners in years past to the publication of the results of their crushing operations either now no longer exists, or exists but in isolated cases. The total yield of gold in the returns of quartz, quartz tailings, and pyrites crushed and treated now approaches so nearly to the estimated amount of gold raised from quartz reefs as to afford very satisfactory proof of the accuracy of the several estimates, and there can be but little doubt that they are very nearly correct. There are no such means of checking the estimated yield of alluvial gold, in consequence of so few of the mine-owners in this branch of mining keeping records of the amount of wash-dirt and cement passed through the machines. The estimates for 1876 show that the yield of gold was less by 100,000 ozs. than the quantity raised in the preceding year. It appears, moreover, that during the past nine years the quantity of gold obtained from the alluvial deposits has fallen off annually, and that the yield of last year is less by two-thirds than the yield in 1868. The general decrease is due to the gradual and inevitable exhaustion of the gold in the drifts of the first discovered gold fields, and to the non-discovery of new mining areas of sufficient importance to compensate for the reduced yields of the older fields. The yearly yield of gold from quartz mines has fluctuated

between 585,575 ozs., the minimum in 1870, and 691,826 ozs., the maximum in 1872. Although the average yield of gold per ton was less in 1876 than during the preceding five years, the statistics show that, taking the past 15 years, it is about equal to the mean for that period. The quantity of pyrites and blanketings operated on during the past year is a little less than the quantity treated during 1875; the average yield of gold per ton is about the same. Over 5,000 tons were treated in the Sandhurst district alone. Ararat is the only mining district not represented in this return.

The mining district giving the highest average return of gold per ton is Gippsland, and the next is Ararat, but the quantity of quartz crushed in these districts as compared with the Sandhurst and Ballarat districts is relatively small. The quantity of wash-dirt panned or sluiced during the year 1876, according to the returns made by certain companies and individual miners, was 574,164 tons 2 cwt., the yield of gold from which was 27,116 ozs. 13 dwts. 22 grs., or an average of 22.67 grs. per ton. Information has been obtained respecting the crushing of 35,938 tons 7 cwt. of cement, which yielded 8,171 ozs. 15 dwts. 4 grs. of gold, or an average of 4 dwts. 13.14 grs. per ton. The number of persons employed on Dec. 31st, 1876, was—alluvial miners, 26,558; quartz miners, 14,452; together, 41,010. The number of alluvial miners is still decreasing. The number now employed is about 10,000 less than in the year 1872; since the same year the number of miners employed in quartz mining also has diminished by over 2,000, but the decrease in both classes of mining in 1876 as compared with 1875 is only 707. In 1872 there were 14,158 Chinese engaged in mining pursuits, whilst in 1876 there were but 11,167. The Chinese miners have decreased in number annually since the year 1861, when they amounted to 24,544. Although the Chinese miners do not in this colony become absorbed in other industrial pursuits, like European miners, it is a remarkable coincidence their decrease in number is almost exactly in the same relative proportion. Dividing the value of the gold exported and received into the Mint amongst the mean number of miners employed in the year 1876 the average is £89.19s. 7d. per man per annum.

During the past five years the number of steam-engines employed in alluvial mining has decreased by 90, and the number employed in quartz mining has increased by 10. A greater number of steam-engines was employed in quartz mining during the last year than in any preceding year. The estimate of the value of the machinery and appliances in use on the several gold fields of the colony for the past five years show: 2,098,574*l.*; 2,131,188*l.*; 2,075,936*l.*; 2,033,629*l.*; and (in 1876) 1,989,500*l.* respectively. The approximate area of auriferous ground over which mining operations extended up to the end of 1876, is 1,134 square miles, and the number of distinct quartz reefs proved to be auriferous is 3,307. The total area occupied as mining claims under the provisions of the by-laws of the several mining boards, and the area held under leases from the Crown, on Dec. 31st, 1876, were—claims, 52,388 acres; under leases, 19,249 acres.

Quartz mining continues to be followed as a remunerative industry year by year at increasingly greater depths, notwithstanding the greater cost of the appliances necessary for working the lodes. One of the shafts at Stawell is 1,290 ft. in depth, and others 1,706 ft., 1,500 ft., 1,262 ft., 1,141 ft., 1,050 ft. At Sandhurst, Clunes, and Ballarat there are also shafts ranging in depth from 800 ft. to 1,158 ft. The quarterly published reports of the mining surveyors show that about 11,500 tons of quartz obtained at Stawell, at depths varying from 430 to 1,060 ft. from the surface, yielded 1 oz. 3 dwts. to 5 ozs. 14 dwts. per ton; that 5,890 tons of quartz obtained at Sandhurst, at depths varying from 500 feet to 1,000 feet, yielded from 1 oz. 14 dwts. to very nearly 2 ozs. per ton; and that quartz obtained from the deep mines at Blackwood, St. Arnaud, Tarrangower, and Stringer's creek has given from 13 dwts. to 3 ozs. 15 dwts. of gold to the ton.

With regard to metals and minerals other than gold produced in the colony the statistics also afford much interesting information. Silver—There were 3,388 tons 10 cwt. of argenteiferous ores raised during the year, and 26,356 ozs. 7 dwts. 19 grs. of silver were obtained, of which 25,839 ozs. 16 dwts. 7 grs. were parted from gold smelted at the Mint. Tin—The exports of tin during the year were 34 tons 9 cwt. Copper—There were 37 tons of copper ore raised during the year. Antimony—There were raised during the year 2,529 tons 5 cwt. 2 grs. of antimony ores, and 606 tons 19 cwt. of antimony ore, 474 tons 2 cwt. of antimony regulus, and 254 tons 4 cwt. of crude antimony were exported. Lead—The quantity of lead ore raised during the year was 17 tons 6 cwt. Iron—Of iron ore 5 tons were raised. Coal—There were 1,095 tons of coal raised during the year. Lignite—The quantity of lignite raised was 315 tons 6 cwt. Flax—There were 1,735 tons 1 cwt. 3 grs. of flagging quarried. Full information relative to the exploration of mines where metals and minerals other than gold were raised is given in the report, and there are many valuable remarks with regard to the metalliferous minerals.

With regard to the number of casualties which occurred in connection with mining operations during the period reported on, the report of the Chief Inspector shows that during 1876 there were 209 accidents in the colony, as compared with 275 in 1875, and 296 in 1874.

The number of miners has decreased each year, but a much greater diminution is shown in the number of accidents. In the year 1874 the mean number of miners employed was 46,512, and the number of accidents 296; 90 persons were killed, and the total number of killed and injured amounted to 335. In 1875, 42,058 miners were employed. There were 275 accidents, 83 persons being killed, while the total number of killed and injured amounted to 300. In 1876 there were 41,531 miners employed, and 209 accidents; 55 persons were killed, and the total number of killed and injured amounted to 225. In alluvial mining there were during the past year 11 fewer men killed and 20 fewer injured than in 1875, and 7 fewer killed and 22 fewer injured than in 1874; in quartz mining there were 17 fewer killed and 27 fewer injured than in 1875, and 28 fewer killed and 53 fewer injured than in 1874; 31 of the fatal accidents occurred to men engaged in alluvial mining, and 24 to men employed in quartz mining; 12 deaths occurred from accidents on the surface, and 43 below the surface; 42 of the killed were Europeans and 13 were Chinamen. More than one-half of the killed were married men, who left 87 children. The reduction in the number of accidents is attributed to the exercise of greater precaution in the working of mines since the passing of the Regulation of Mines Statute in 1873.

The Chief Inspector is well justified in congratulating himself upon the improvement shown. Although the number of miners employed in 1876, as compared with the preceding year, was reduced only 2.5 per cent., the reduction in the number of killed amounted to 33.7 per cent., and in the number of injured to 21.6 per cent. The deaths were 1.15 per thousand of the mean number of alluvial miners employed during the year, and of quartz miners 1.52 per thousand. In other words, one death occurred in every 869 miners engaged in alluvial mining, and one in every 608 men engaged in quartz mining. The average death rate per thousand of both classes of miners was 1.32 per thousand, or one death to every 755 miners. This is not so high a proportion of fatal casualties as that shown in the latest return relating to British metalliferous and coal mines, so that the Victorians have good reason to be thankful, and encouragement to endeavor to secure equal safety in future.

### Shipments of Gold Dust from Fresno.

Through the courtesy of Mr. Louis Einstein, and by permission of Wells, Fargo & Co., we have been enabled to glean some statistics relative to the shipments of gold dust from Fresno since the first of last January. We find that in 51 separate shipments, averaging \$200 each package, \$10,101 have been sent below through the Fresno office alone. Besides this, large amounts have been sent marked as sealed packages of coin, and some have been carried out of the county both by whites and Chinese. This, in reality, represents only the gold dust gathered by the Chinese on the San Joaquin river and in various small gulches, and is not an estimate of the gold product of the county. These shipments have been almost exclusively by Chinese, and have come mainly from the old mining camp and county seat, Millerton. Recent discoveries and extensive preparations for working some old claims by white men, give promise of increased shipments next season. Besides several quartz mines are opened or being developed which promises handsome returns. Treasurer Thorn's mine, a few miles south of Big Dry creek, which formerly yielded \$16,000 a year with an arastra, but which has been idle for some time, will probably be reopened during the coming year. In the opinion of some whose judgment should be good, the Jensen mine on Dry creek, is a bonanza in itself, and some others in that vicinity need only a little capital to work them profitably. The Confidence mine, near Fresno Flats, and also a new discovery in that vicinity show some of the finest ore we have ever seen. Recent discoveries in the extreme upper King's river country indicate valuable deposits of gold, silver and copper. It is quite certain that the mining resources of this county are considerable; and it is to be hoped that white men's money and white labor will develop them, and thus allow the county to reap its legitimate benefit.—*Republican*.

RESTING SPRINGS.—A correspondent of the *Colton Semi-Tropic*, writing from Resting Springs district, San Bernardino county, says: The mining outlook for this county is brighter at present than it has been in several years. The Resting Springs mines are proving to be, in every way, a decided success, and are constantly improving in richness and general appearance. There is no longer any doubt of their proving a permanent and profitable investment for the owners. We learn from a private letter from O. G. Leach that, while out walking, a few days since, with a gentleman named Cunningham, in the vicinity of Resting Springs, they discovered one of the richest mines in the district. Mr. Leach says they intend to commence work on it immediately, as they have an excellent showing of high grade ore that will pay to ship to San Francisco. Mr. Leach is good authority on such matters, having spent the greater portion of his life in mining and milling, and is at present engaged in assaying for the Resting Springs mining company. We also learn from miners from the Ivanpah mines that the mines never looked better than at present, and, under judicious management, they would pay good dividends.

## MECHANICAL PROGRESS.

## Marine Steam Boilers.

The building of marine steam boilers is a question of interest to mechanics on this coast. We notice that at the last meeting of the British Society of Naval Architects, there were several papers presented on the subject. Mr. Haswell, in treating the subject in detail, submitted the following rules for the proportions and construction of a marine steam boiler with multifold tubular return: Construction.—For a combustion of 16 pounds of bituminous coal per hour, with a depth upon the grates not exceeding nine inches, heating surface 36 times the area of the grates and with fresh water. (When salt water is used one-twelfth is to be added to the surface). Volume of water from and at  $212^{\circ} 10^{\circ} C + 25 = V$  and by inversion  $\frac{V-25}{10} = C$ ,  $C$  representing the coal in pounds per square foot of grate per hour, and  $V$  the volume of water evaporated in pounds. For a like combustion of coal, and heating surface 50 times the area of the grate.— $11.2 C + 25 = V$  and  $\frac{V-25}{11.2} = C$ . For a combustion of 30 pounds of bituminous coal per hour, with a depth upon the grates of 12 inches, heating surface 36 times the area of the grate and with fresh water.—Volume of water from and at  $212^{\circ} 9.8 C + 25 = V$  and  $\frac{V-25}{9.8} = C$ . For a like combustion of coal, and heating surface 50 times the area of the grate.— $10.9 C + 25 = V$  and  $\frac{V-25}{10.9} = C$ . Mr. Haswell gave some practical suggestions as to the construction of marine boilers, and said, in conclusion, that for use in salt water the thickness of plates and the diameter and area of bolts and stays should be increased one-sixth. Wrought-iron bolts and stays are reduced in strength 25% by cutting the thread of bolts, 20% by welding and 18% by exposure to sudden strain. The mean tensile resistance of boiler plates is 55,000 pounds per square inch, and with the fiber it is from 8% to 10% greater than across it. Rivet iron at a temperature of  $60^{\circ}$  should have a tensile resistance of 60,000 pounds per square inch.

## Strength of Boilers.

Mr. J. Milton, Surveyor to Lloyd's Registry, referred to the effect of the introduction of the compound engine in reducing the consumption of coal, stating that this consumption might be still materially lessened. Higher pressure would accomplish this, and how safely to obtain higher pressure is an important practical question. Not less important than the actual factor of safety is the question how it should be measured. After stating that certain parts of boilers are subject to greater strain than others and therefore liable to give at a lower pressure, Mr. Milton referred to several particulars in which many of the marine boilers of the present day suffered from defective construction, which made their actual margin of safety much less than their supposed one. Yet such boilers run safely. Boilers are subject to certain strains arising from the unequal expansion of their different parts. If ordinary wrought-iron plates are subjected to stress, they alter in length a certain amount according to the quality of the iron, the more ductile irons altering more for the same amount of stress. Difference of temperature has an important influence. The only way to strengthen furnaces from excessive strains is either to prevent the difference of temperature or else to allow the crown freedom to expand. The better way is to flange the furnace crown on to the tube plate with a large radius. The shell of the boiler is subject frequently to variations of temperature in its several parts, thus inducing unequal pressure. To reduce strains thus occasioned, a soft ductile iron should be used, allowing a given stretch with less stress than a hard plate, and the strength of the circumferential seams should be made as nearly as possible equal to the solid plate, or provision should be made for such a circulation of the water in the boiler as will prevent the difference of temperature from coming on the material. Landore steel promises to be the best material for use in marine boilers, in respect both of strength and ductility. With respect to the circulation of the water several plans have been adopted. Of two plans which give equal results, that which is provided for in the design of the boiler must have preference over one requiring any special attention on the part of the engineer.

## American Skill in Silver Working.

It is quite a gratifying thing to know that Americans are not deficient in that skill in metal working which approaches the borders of the fine arts. It is said in the *Silversmith and Watchmaker* that Europe was quite surprised to see, at the Centennial, that American workmen were skillful enough to execute a piece of work like the Bryant vase, which we described last year in the MINING AND SCIENTIFIC PRESS. It will doubtless be interesting to read of some of the processes by which this vase was produced. We quote from a writer in the *Silversmith*: "As far as handcraft is concerned the 'Bryant vase' showed that hammered or repousse

work was well known to our artisans. European work of the best class, not excepting the celebrated Milton shield, wrought by Morel La Denil, or the finest attempt of Vecht or Attarge is inferior to this, for most of these were on flat surfaces, while the triumphant American piece was executed in relief on a vase, every part of which was hammered out. This, perhaps, might need a few words of explanation, yet every one will understand that it is evidently much easier to hammer out ornament on a plate of metal than on a vase, the inside of which is more difficult to reach with a hammer. The method the Tiffany's used in producing the vase is, nevertheless, simple in theory, and I will endeavor to explain it. An ingot of silver of sufficient size is hammered out into a round, flat piece of even thickness, which will be beaten into the shape of the body of the vase. The rim of this silver disk is first hammered up, giving the piece the appearance of a deep saucer; on the edges of this saucer parallel flutes are next struck with a quilling hammer. The object of this is to facilitate the difficult operation of 'drawing up' the sides. This is produced by hammering up the silver by a series of blows, striking the metal, not on an anvil, but rather over the edge of a peculiar-shaped anvil called a stake iron, the hammer falling on the silver a little higher than the spot that rests on the anvil. The workman continues turning the piece, which he holds with one hand while he strikes with the other, hammering the bottom of the saucer with a specially shaped hammer called a 'dipping up' hammer. The silver is also worked out or 'lowered.' By judiciously combining the two processes of drawing up the sides and lowering the bottom, the shape of the lower part of the vase is obtained. The malleability of metal allows the craftsman, by the use of his hammer, to draw in the metal at the top, thereby completing the shape. Great skill is required to keep the thickness of the silver even during the operation. Sometimes hammers made of buffalo horn are used in particular parts of the process.

"I will now show how the raised ornament is produced: The next operation is that of 'snarling.' This euphonic term signifies the process by which the requisite amount of silver bumps will be produced on the surface of the metal to allow the ornament to be worked up in relief. In many cases, for instance, when the neck of a coffee-pot of Persian shape is hardly one inch in diameter, it seems at first sight, impossible that a hammer could be introduced to beat out the ornament. This work is done with a snarling-iron. Suppose a piece of iron 18 or 20 inches long, terminated at one end by a short elbow bearing a small, rounded knob, and at the other by a flat piece, also bent at right angles with the rod, which can be securely fastened to a vise; this iron is introduced into the body of the vase, on the outer surface of which the ornament to be produced has been sketched; the vase is held in a horizontal position; the rounded knob brought in contact with the inner surface; an apprentice, armed with a heavy hammer, strikes the part of the tool held in the vise, and the concussion of the blow, carried along the snarling iron, causes a bump to be raised on the outer surface of the silver; soon a continuous series of bumps is produced on the vase which sketch out the relief of the ornament, roughly, it is true, but very much in the same way as a modeler first disposes lumps of modeling-wax on a pattern he has to ornament with flowers or figures. When the snarling is done, that is, when the entire relief of the ornament has been beaten out with the snarling iron, the work of the chaser begins. Into the vase is poured a hot cement, consisting principally of pitch; when this cools the vase is filled with a solid, yet slightly elastic body, which yields to the blows that may be given to the outer surface of the metal. The chaser's skill consists in finishing the outside of the piece, denting it with blows from small punches and flat tools struck with a light hammer. He pushes back the silver where the snarling iron has pushed it out too far, and soon produces the delicate ornaments people so much admire on fine repousse work."

A LUBRICATING PLOW.—We read in *Mines, Metals, Arts, etc.*, of an invention which is said to be practical, but which we should prefer to see at work before investing therein. It "consists in the combination with the mold-board of a plow, of a fountain attachment, introduced between the mold-board and share; also lubrication from the colter on its sides, and to the plow point, through which oil, water, or other liquids may be supplied, whereby the face of the mold-board is caused to pass smoothly and easily through the soil, without the sticking and adhering of the soil, as always happens without their device. The fountain consists of perforations, or thin slit openings, between the mold-board and the share, which are connected by proper tubes with a tank of oil (or water, which is just as good) to a reservoir, which may be attached to the handles or beam, or preferably to a tank or cask on the riding wheels of the plow, whence the lubricating liquid is supplied to the tubes and oozes or passes out through the slits into the colter, share and mold-board, and permitting not only sticky or waxy land to be turned over and broken up, but as well applies to the hard clay soils of any country, in the time for summer and fall plowing." It is said further that "the reservoir may contain 50 gallons of water, or a day's supply in plowing one and a half or two acres." But what do the horses think of the draft of a plow weighted down by 400 pounds of water?

## SCIENTIFIC PROGRESS.

## Study of Earth Worms.

This most curious case of the intimate relations of animals to plants, and of both to the processes of sub-aerial change taking place on the earth's surface, has recently been worked out in great detail by Von Hensen, who, strange to say, does not seem to have heard of Darwin's labors, which he confirms and supplements. He states that the adult worms come to the surface at night, and, with their tails in the mouths of their burrows, survey the country round and collect food in the shape of leaves and twigs. These are heaped up around the entrance, the leaves being rolled up separately and partly drawn into the tube, where they soon become macerated and partially decomposed, so as to form such savory meat as the worm's soul loveth.

Von Hensen's observations were conducted in a garden with a layer of mold nine inches deep and a subsoil of yellow diluvial sand. The worm-tubes were not easily traced in the mold, but were perfectly clear in the sand, running vertically downward to a depth of from three to six feet. The tubes were often found to be lined with stones about the size of a pin's head, brought from the surface, and fruit kernels were also found in them. But the point of chief importance is that the walls of the burrows were found to be beset with little black masses of a characteristic shape—the excrements of the worms. Besides these fresh inhabited tubes, others were found in which the cavity was filled with black earth, the black color being diffused into the surrounding sand, and these again passed insensibly into mere black stripes—veins of mold running in the sandy subsoil.

In about half of the uninhabited tubes were found the roots of plants growing on the surface. These followed exactly the direction of the tubes and gave off fine root-hairs through the black walls of the latter. From an extended series of observations, Von Hensen states that the roots of annuals can only penetrate into the subsoil through channels opened out to them by earth worms; and he observes that this penetration must be of service to the plant, as the subsoil retains moisture longer than the surface layer of mold.

The contents of the intestines and the excretions of worms show a great similarity in microscopical and chemical characters to "vegetable mold" (*Blattererde*), formed by mixing together rotting leaves and sand and leaving them for about two years, after which time the leaves are found to have undergone complete decomposition, a very few shriveled cells being discoverable among sand grains and brown organic molecules.

To ascertain the precise part taken by the earth worm in the production of this vegetable mold, Von Hensen placed two worms in a glass vessel filled with sand, on the surface of which was spread a layer of fallen leaves. The worms set to work at once, and after about six weeks the surface of the sand was found to be covered with a layer of mold nearly half an inch deep, while many leaves had been carried to a depth of three inches. Worm-tubes ran in all directions through the sand. Some were quite fresh, others had a wall of mold an eighth of an inch thick, others again were completely filled with mold. In short, the soil of the vessel was already perfectly well prepared for the growth of plants.

A single worm weighs about 46 grains, and produces, in 24 hours, nearly eight grains of excrementitious matter. There are, on an average, about 34,000 worms to an acre of ground, the combined weight of which is over 220 pounds, and which together pass through their bodies and reduce to a fine state of division about 37 pounds of mold in 24 hours. Besides this they produce a uniform distribution of the mold, open up passages in the subsoil for roots and render the subsoil fertile. They thus perform for the agriculturists an office which is not only valuable and extensive, but quite inimitable.

INFLUENCE OF WINE BOTTLES ON WINE.—It has recently been determined in France that wine may be injured through the glass of the bottles in which it is contained being too alkaline. According to analyses given the *Revue Industrielle*, glass for wine bottles should yield per 100 parts: silice, 58.4; potash or soda, 11.7; lime 18.6; clay and oxide of iron, 11; other ingredients, 0.3. Glass in bad bottles has been found to contain, silice, 52.4; potash or soda, 4.4; lime, 32.1; clay and iron, 11.1. It seems that the wine suffers principally from excess of lime. Thus, in glass composed of silice, 45, soda, 15; lime, 30, and clay, 15, for example, the wine became thick and lost its aroma. The best bottle glass contains from 18 to 20 parts lime and 59 to 60 silice; the worst, 50 to 52 silice and 25 to 30 lime.

HISSES AND THE TELEPHONE.—Sir William Thomson, referring to the telephone, said that hissing sounds cannot be carried by it as far as the graver tones. With short connections, sounds of all descriptions and tone are reproduced accurately at the receiving station, but when the stations are far apart over tones are lost and only the fundamental tone is reproduced.

## Mars' Moons and the Nebular Hypothesis.

When science brings to light new facts is the quick impulse of the scientific thinker to test by them theories and hypotheses which have won credence. Thus, when Prof. Kirkwood, of Indiana, takes up the discovery of the satellites of Mars and reviews the nebular hypothesis in the light of them, we are all attention. From a letter which Prof. Kirkwood writes to the editors of the *American Journal of Science* we quote these paragraphs:

From eight measurements of the position and distance of the inner satellite of Mars as taken by Prof. Hall within three days from the date of his first observation, Prof. Newcomb found the period to be seven hours and thirty-eight minutes. On the theory, therefore, of a circular orbit the satellite is within 8,400 miles of the planet's surface. Prof. Hall remarks that the diameters of the Mars satellites are extremely small, probably not more than 50 or 100 miles. It is interesting to observe that even with the larger limit the bodies are smaller in comparison with their primary than any other secondaries in the solar system. According to Proctor Mars revolves on its axis in  $24^h 37^m 22.735^s$ . The inner satellite, therefore, completes three orbital revolutions in less than a Martial day. How is this remarkable fact to be reconciled with the cosmogony of Laplace?

Although the period of no other satellite is less than that of the rotation of its primary, the case can hardly be regarded as wholly unique. The rings of Saturn are clouds of extremely minute secondary planetoids revolving about the primary in approximate accordance with Kepler's third law. The periods of those in the outermost ring, like that of the exterior satellite of Mars, are somewhat greater than the rotation period of the primary. Those near the outer edge of the interior bright ring revolve in the same time with Saturn, and those at the inner visible edge of the dusky ring complete a revolution in about eight hours. "These rings of Saturn, like everything cosmical, must be gradually decaying, because in the course of their motion around the planet there must be continual impacts amongst the separate portions of the mass, and of two which impinge, one may be accelerated, but it will be accelerated at the expense of the other. The other falls out of the race, as it were, and is gradually drawn in towards the planet. The consequence is that, possibly not so much on account of the improvement of telescopes of late years, but perhaps simply in consequence of this gradual closing in of the whole system, a new ring of Saturn has been observed inside of the two old ones, what is called from its appearance the crape ring, which was narrow when first observed, but is gradually becoming broader. That is formed of the lagards, as it were, which have been thrown out of the race, and which are gradually falling in towards the planet's surface."

The process by which, in the case of Saturn's rings, the period of revolution has become less than that of the planet's rotation is here clearly indicated. It is not impossible that a similar process may have been in operation during the forming period of the Martial system. Unless some such explanation as this can be given, the short period of the inner satellite will doubtless be regarded as a conclusive argument against the nebular hypothesis.

ARTIFICIAL COLOR IN BRANDY.—It is a well known fact, says *Fresenius' Zeitschrift*, that the longer brandy is permitted to remain in the cask the darker it gets in color—due to the taking up of the coloring matter in the wood. Liquor dealers have a strong inclination to have nothing but old brandy, so-called, in stock, therefore color their young liquor by means of burnt sugar (caramel). This falsification is at once apparent to the practiced tippler, but a chemical test is nevertheless very desirable. Herr E. Carles discovered that the falsification referred to can be detected by means either of the albumen of an egg or sulphate of iron. If to two samples of brandy, the one colored by natural means, the other by sugar, one-sixth of their volume of albumen be added, they will become turbid. On clearing, either by being permitted to stand quietly or by filtration, the artificially colored liquor will retain its color while the unadulterated will be almost colorless. The addition of a concentrated solution of sulphate of iron will not affect the tampered liquor, while the true article will be colored to a blackish green color, more intense as the brandy is aged.

SOCIAL INSECTS.—In an article in the *Popular Science Monthly*, E. R. Leland writes: "The life of ceitons or carnivorous ants is not all work, however; they seem frequently to be employed in a way that looks like recreation. This always takes place in a sunny nook. The main column of the army and the branch columns are in their ordinary relative positions, but instead of pressing forward eagerly and plundering right and left, they seem to be smitten with a fit of laziness. Some walk slowly about, others brush their antennae with their fore feet, but the drollest sight is their cleaning one another. Here and there an ant may be seen stretching forth first one leg and then another to be brushed and washed by one or more of its comrades, who perform the task by passing the limb between the jaws and the tongue, finishing by giving the antennae a friendly wipe."

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**COVER.**—Amador Ledger, Oct. 6: The mill is idle, but there is considerable activity at the mine. Sinking the new shaft is proceeding vigorously. Large piles of ore are accumulating on the dumps, and everything connected with the mine looks prosperous. One new feature is the fling of new drilling machinery of the most improved pattern to work by compressed air.

**LINCOLN.**—We learn that a number of mechanics have been engaged lately in repairing the shaft. This looks as though work was to be resumed at no distant day.

**KENNEDY.**—Assessments are yet the order of the day with this mine. At the works the taking out of rock progresses. The dump of the mill is full of quartz. It is said that the ore prospects well, but a crushing mill will have to be made before its paying quality is placed beyond a doubt. **GRANITE.**—This is the old black mine, on the east side of the river, which so much was said last year. The new 10-stamp mill, in process of erection by Knight & Co., of Sutter creek, will be finished inside of two weeks. Some time must elapse, however, before the crushing of rock can be commenced. The laying of pipe and cutting branch ditches will consume both time and money. Good judges say that when once the mine is put in working shape, it will steadily repay all the preliminary expenses. The quartz prospects well, and there is any quantity of it.

**COMET.**—In the Comet a well-defined ledge has been struck at a depth of 170 feet from the surface. The ore-body is 18 inches wide, and seems to widen as sinking progresses. It prospects well.

**ANOTHER MILL.**—Amador Dispatch, Oct. 6: A 10-stamp quartz mill is being erected about a mile above Drytown, on Dry creek, by Mr. Davis, of Plymouth, at which place he has recently discovered a rich vein of quartz. The mill will be used principally to do custom work until Mr. Davis gets his mine opened.

**THE KENNEDY.**—The Kennedy mill is now about full of rock, and preparations are being made to commence crushing.

**THE PENNSYLVANIA MINE.**—The shaft in this mine near the Gover, is now down about 100 feet, where the lead is seven feet wide, and the rock yields \$12 per ton.

**POTOMI MINE.**—Preparations are now being made to thoroughly work the Potomac mine, near Drytown, which has been lying idle for some time. The old shaft was down about 270 feet but allowed to fill up with water, and the old timbering to decay. The water has all been hoisted out, and the shaft retimed about half way down. A site has been graded for the erection of a new mill. The rock at the bottom of the shaft is of a fine quality.

### CALAVERAS.

**BANNER.**—Calaveras Chronicle, Oct. 6: The new machinery lately put upon the Banner mine at Mosquito was in motion last Monday. Excepting a little "stiffness" incident to new machinery, but soon working admirably. The pumps are rapidly freeing the mine of water. The Banner—better known, perhaps, as the "Grasshopper"—has a reputation for richness second to no mine in the county.

**WORK RESUMED.**—Operations have been resumed in the well-known Dursey gravel mine in Chili gulch, after an enforced idleness of several months for lack of water. There is no water for milling purposes, but the hands have been set at work running levels and getting ready.

**TIGER MINE.**—We have it from reliable authority that work will shortly be resumed on the well-known Tiger mine, at Rich Gulch. We learn that the proprietor, C. H. Livingston, Esq., has finally consented to the placing of the mine in the hands of a joint stock company, in obedience to the wishes of some San Francisco capitalists. The intention is to erect a 40-stamp mill this fall, and work the mine systematically and on a large scale.

**RICH ROCK.**—A small lot of quartz from the ledge recently discovered near Mosquito, by Henry Harryhausen, crushed in Garland's mill, paid upwards of \$70 per ton. The rock was a small lot worked more for the purpose of proving the vein than anything else, and came from near the surface.

**ASBESTOS.**—Some very fine samples of asbestos—in fact, the best specimens of the article we ever saw—have been left with us by Mr. Robert Hoskinson, of Lower Rich Gulch. The fibres of the mineral refined are not extraordinarily long, but they are as fine, soft and pliable as silk.

### FRESNO.

**FRESNO G. M. CO.**—Fresno Exporter, Oct. 3: Work on this mine is going ahead briskly. The vein has been prospected sufficiently to satisfy the stockholders that it is extensive and rich. The President of the company, W. D. DeFrees, has gone to San Francisco to purchase the machinery for a quartz mill. As soon as the machinery arrives a five-stamp mill will be erected. The engine will have a capacity for running 10 stamps, and should the mine develop as favorable as now anticipated, the additional five stamps will be put in. The flattering prospects of the Fresno gold mine has created an interest in quartz mining in its neighborhood, and several mines have been located and prospecting is still going on. From present appearances, the long neglected quartz interests of Fresno county will be thoroughly tested. The indications are favorable for the early opening of a number of rich quartz mines.

**RICH.**—We are informed that Sam and E. Dennis' quartz mine, on the Fresno river, is turning out exceedingly rich. They are taking out from \$18 to \$20 per day, crushing the rock with an ordinary sledge hammer and then panning it out.

### INYO.

**SUSPENSION.**—Coso Mining News, Oct. 6: The Cuervo mining company, that has been operating here so successfully for several months, under the very efficient management of Mr. W. H. Rodda, Superintendent, has suspended operations on account of some legal matters necessary to be settled. We are assured by Mr. Rodda that the suspension is but temporary. He goes down to the day-to-day to make arrangements for operating on a more extensive scale at an early day. The Cuervo is one of the finest properties in Inyo county. The company closes its business with a clean record.

**BULLION SHIPMENTS.**—For some time there has been no bullion shipped from the Rex Montis mine, for the reason that the charcoal supply for melting had become exhausted. This difficulty was overcome by burning some more, and last Thursday there arrived here, upon the stage, 13 bars of fine bullion, weighing 395 pounds and valued at \$10,500. On the 2d inst. the Emigrant company shipped 99 pounds of fine bullion, valued at \$1,250. Same day the Minuetine shipped 224 pounds fine bullion, valued at \$3,500.

### LAKE.

**GREAT WESTERN.**—Democrat, Oct. 6: Having occasion to go to the Great Western quicksilver mine, the other day, we were surprised at the amount of work going on in that section. A steam saw-mill, running to its fullest capacity, keeps a large force of men working constantly at work. The mine is running a large force of men under the supervision of Mr. Roca. Following are the shipments from this place during the last two weeks: Great Western quicksilver mine to H. M. Newhall, San Francisco, 238 flasks of quicksilver; Sulphur Banks quicksilver mine to Parrott & Co., S. F., 329 flasks; Napa Con. quicksilver mine to D. Meyers, S. F., 76 flasks; T. Wright to John Hanscom, S. F., 14 flasks of quicksilver. There is also 100 flasks being unloaded to-night.

### MONO.

FROM BENTON.—Coso Mining News, Oct. 6: From Mr.

E. R. Miner, Wells, Fargo & Co.'s agent at Benton, we learn that times at Benton are about as lively as ever, with better prospects for the future. Two mills are running on good ore, but the Diana mill had been compelled to suspend for a short time for want of chemicals. A large pump has been put upon the Comanche mine to pump out the water, which is 40 feet deep in the shaft. Albert Black, who sold out his interests in mines and mills there for \$120,000, and spent the entire summer with his wife in the East, returned last spring, and is now engaged in the saw-mill business, besides having interests in the Diana, being President of the same. Lumber is furnished from this mill to supply the wants of Marietta, Belleville and other places in the vicinity. The Laura mine has, the present summer, turned out some very fine ore and in sufficient quantities to pay for running the mine for a year and having a surplus on hand. The ore from this mine was worked by the Comanche and Indian Queen mines, by dry process and the White furnace for roasting. Mr. Miner does not recollect distinctly a surplus of bullion shipments for this year, as reported by him, but says they will average upwards of \$30,000 per month for all the mines at Benton, being something of an increase over those of last year. There has been an increase of population and business houses this year at Benton, and altogether the prospects for a better future are any thing but discouraging.

### MONTEREY.

**SILVER.**—Monterey Democrat, Oct. 6: In relation to the discovery of a very promising silver-bearing ledge at the headwaters of the north fork of the Little Sur, we have very recently obtained some reliable information, and we are gratified to note that it is now being vigorously worked and the development is very flattering. The ledge is about four feet in thickness on the top.

### NEVADA.

**CLEAN-UP.**—Nevada Transcript, Oct. 6: The Eureka Lumber Company, as we were informed, made a cleaning up of what is known as the McCarty ditch, near Columbia fill, this week. The yield is said to have been immense, better than any former yield in the same diggings. What the gross proceeds were in dollars and cents we dare not state, as it was given to us in confidence, but we may say it was high up in the thousands.

**SOUTH FORK MINE.**—San Juan Times, Oct. 6: The North Fork mine, an incorporated company, located at Forest City, held their annual meeting on Monday, the 1st inst. The mine is divided into 1,000 shares, quite a number of which are held by divers citizens of this place. The following named persons were elected Trustees for the ensuing year: J. B. Hunter and John Hill of this place; Mr. Hiseock, of San Francisco; John Nelson and Mr. Howell, of Forest City. A proposition was made by Judge Davidson, of Downsville, on behalf of certain English capitalists of London, to bond the mine in the sum of \$300,000 for four months, commencing October 1st, which was accepted by the company. The face of the tunnel is about 100 feet from the ledge which was struck in the tunnel. The quartz ledge at the face of the tunnel is about 14 feet wide, and assays \$320.50 to the ton in gold and silver. The enormous Eld Mountain mining company, which adjoins the North Fork, ask \$200,000 for their mine, and that mine is about half worked out. On the whole, Forest City and that section of the country has a bright outlook. Wish we could say the same for San Juan and vicinity.

### PLACER.

**QUARTZ FERRA.**—Placer Herald, Oct. 6: The Excelsior mine, near the Eclipse mill, owned and worked by the Werry brothers, is turning out some good rock. The rock has paid very well from the top down, but it is best at the bottom of the shaft, which is now about 100 feet deep. The Messrs. Werry have the mine bonded to a San Francisco company for \$13,000. The Eclipse company, under the management of Mr. Vincent, are running their mill very steadily on custom rock, and are doing, we understand, very satisfactory work. The Pugh mill, also, near Ophir, is kept busily engaged on custom work, and, as usual, gives general satisfaction. Robinson & Hersh, on Posterior flat have their shaft down about 80 feet, on a ledge that promises well. Their gold and silver yield is \$21 per ton, which is very good considering their ledge is fair ore. The Kaiser boys, whose mine is on the hill north of Ophir, and which, while back was paying so handsomely, are at present not doing much. At the Good Friday, a small force is at work taking out rock, though with what results we did not learn. Other ledges are being prospected in the Ophir district, and some of them under our information, are rich in gold and silver.

**LOWER HILL MINES.**—Dutch Flat Forum, Oct. 4: The work of extracting gravel from the Swamp Angel mine has been at a standstill for one month. This is owing to a lack of water for two reasons. First, the springs having become very low failed to furnish sufficient water to run the air blast; second, the supply of water purchased from the Little York G. M. & W. Co. to wash with once a week, for some reason was cut off entirely. The latter first is being remedied by supplying the drifts with air by means of a fire blast, the second by the construction of a large tank, which is nearly completed. The water caught in this manner will be utilized in washing twice a week, in place of once as heretofore when supplied by the ditch. The East New York tunnel is advanced 500 feet, the rock now encountered being favorable for making good progress. The Wilcox Cat, it is thought, would have been tempted before this time had not the owners been compelled to abandon the raising of the incline for the present, owing to a lack of air. This will be remedied in a short time, when the Cat will be compelled to yield up peacefully the rich treasures so long looked up in her bowels. The tunnel in this mine is completed a distance of 100 feet.

**Too Low.**—The Mule Spring Ranch mine, the next below, and located as the Planet, on the Bear river side of the divide, has a frontage of 1,500 feet. The construction of a tunnel was commenced in this mine some time since, and was completed a distance of 300 feet, but from recent surveys it was found to be considerably too high; it has, therefore, been abandoned, and another started 100 feet lower.

The property known as the Leary mine was recently purchased by W. P. Dewey, of San Francisco. Mr. Dewey in having the ground surveyed, had also a survey made of the grade of the channel, from the Swamp Angel mine to a point below the Leary ground, showing by this that the tunnel constructed by Mr. Leary, a distance of about 300 feet, was too high. The contract to run the tunnel on a lower grade has been let to some Dutch Flat miners, and the work of constructing the same is now under full headway, running day and night.

**LIBERTY HILL MINES.**—The Little York G. M. & W. Co. are making active preparations for the approaching season. The bedrock out in the Liberty mine has been completed, and the greater part of the flume laid. Seven hundred feet of powder drifts have been blown and exploded, pulverizing the banks in a satisfactory manner for washing. A tunnel 700 feet in length, tapping the ground known as the Union mine, is being enlarged, and in which will be constructed a five-foot flume, through which they will wash the coming winter.

**REMINGTON HILL MINES.** The tunnel started by the Rhode Island company recently and held to run towards the line of the Wide West mine, is already completed a distance of 250 feet. At this point there is still three feet of bedrock to contend with. The gravel overhead is of sufficient richness to pay good dividends for drifting. The tunnel will be advanced 60 feet further, when side drifts will be opened for the purpose of breasting out. A large part of the work is being done by the Wide West mine. The proprietors of this valuable property, Messrs. McCann & Meyers, are sparing neither pains nor expense to have all things connected with their mine fitted up in an advantageous manner for the winter's work.

### SANTA BARBARA.

**OIL.**—Santa Barbara Advertiser, Oct. 7: The Santa Barbara oil company are now drilling night and day. They have reached a depth of 125 feet, and are still pushing down. They have a large tank up to receive the oil, when they shall require it.

### TUOLUMNE.

**IMPROVED MINE.**—Tuolumne Independent, Oct. 6: A San Francisco company, preparing to mine Chapman hill, near Yankee hill, with the new hydraulic gravel elevator. One of these machines is on the way, and was expected to arrive at Columbia yesterday. Mr. Barron, the active Superintendent, is preparing the claim for the new machine, and expects to have everything ready for operation by the time a full supply of water is obtained. From prospecting, it is ascertained that there is a large sink of gravel in the hill, which in times of high water, will pay well wherever tapped by means of shafts. Water, and other difficulties of working by that method, caused it to be abandoned as unprofitable, although the gravel was known to be good. There being no dump, and too much debris to remove by hoisting, it was decided by the present company to put on one of the newly invented hydraulic gravel elevators. By this machine, water and gravel can be sluiced uphill, and mines worked that had no dump. [This machine was described and illustrated recently in the MINING AND SCIENTIFIC PRESS.—Eds. Press.]

**RICH QUARTZ.**—Ozden & Co., at their claim in the gulch below Bix's brewery, Columbia, are taking out good pay. But what is better, they are actually being finding small pockets, and lately have struck a series of good ones. One day last week they emptied one of \$319.50 in gold. It is the opinion of old quartz miners that these young men will develop a regular lode of great value. That locality has been rich in gold for the past 25 years, and placer mining below has proved highly remunerative. The fact is that the gravel below has been fed with gold from rich quartz ledges, and Ozden & Co. seem to be proving this theory correct. They are now down between 50 and 75 feet.

## Nevada.

### WASHOE DISTRICT.

**CONSOLIDATED VIRGINIA.**—Gold Hill News, Oct. 10: Daily yield, 500 tons, from the regular producing sections, keeping all the mills steadily running with a surplus on hand. A considerably increased milling capacity could easily be kept supplied. The principal improvement mentioned in the mine is at the 1200-ft level, where a new body of ore, some 20 feet in width and assaying over \$100 to the ton from average car samples, is being developed. This new body extends to the southward and eastward from the main ore channel, and is a very important development in that direction. The diamond drill boring from the 1550-ft level to tap the water in the southeast portion of the 1400-ft level has not yet effected its object, but is expected to very shortly. At the 1750, or lowest level, recently opened, the main drift cross-cutting the vein westward continues in quartz and porphyry, and has not yet run through into the west ore vein as shown in the level above. The ore in the other cross-cuts at this level thus far does not turn out as high grade as desired. Considerable timbering in the main C. & C. drift at this level is found necessary and being done at present. At the 1650-ft level the main drift westward the Consolidated Virginia shaft is in porphyry and low grade ore. It will be nearly two months before the connection is made. The south branch drift, to open up the ore stores in that direction, is pushing ahead in hard rock. The ore stores and breasts at this level continue their rich yield, especially as they are further developed to the north and west. The ore stores and breasts of the 1400-ft level are showing and yielding plenty of high grade ore, and the same may be said of the 1300-ft level. Large ore reserves at this point which can be taken out whenever required.

**CALIFORNIA.**—Daily yield, 675 tons, the various ore stores and breasts looking well, and yielding as usual. The main drift south at the 1400-ft level from the Ophir mine is in 375 feet, following the west wall. At the 1750-ft level the main west drift cross-cutting the vein is in 113 feet beyond the winze, with the face of the drift in low grade quartz and porphyry. It is about passing through into the west ore vein. The drift will be pushed through to the west end of the ore channel as speedily as possible, and breast and low grade ore will be developed. At the 1650-ft level the main west drift is in 113 feet, following the west wall. At the 1750-ft level the main west drift cross-cutting the vein is in 113 feet beyond the winze, with the face of the drift in low grade quartz and porphyry. It is about passing through into the west ore vein. The drift will be pushed through to the west end of the ore channel as speedily as possible, and breast and low grade ore will be developed. At the 1650-ft level the main west drift is in 113 feet, following the west wall. At the 1750-ft level the main west drift cross-cutting the vein is in 113 feet beyond the winze, with the face of the drift in low grade quartz and porphyry. It is about passing through into the west ore vein. The drift will be pushed through to the west end of the ore channel as speedily as possible, and breast and low grade ore will be developed.

**BEST & BELCHER.**—The connection between the Gould & Curry 1900-ft level and the Savage yield is now being completed, the drift south at that level is being extended into the Best & Belcher. It will be continued through that mine to the Consolidated Virginia, thus establishing an important connection.

**CHOLLAR-POTOSI.**—Daily yield 75 tons, the average assay of which is \$22.50 per ton. The main drift east at the 1750-ft level continues pushing ahead in very hard rock. **YELLOW JACK.**—The main drift east at the 1750-ft level toward the new shaft is now in 355 feet from the winze; face in porphyry with fine quartz seams. The main shaft drift at this same level is in 335 feet, with the face almost wholly in very favorable looking quartz. At the new working shaft to the eastward, the powerful new machinery was started into operation yesterday, and everything looked bright. The main drift east at the 1750-ft level, which was named last night, the new "kicker" or "skip" raising the rock and water and dumping the same in a very effective style.

**JUSTICE.**—Daily yield of ore from 334 to 400 tons, which is taken from the various producing portions of the mine, from the 1000 to the 700-ft level. The stores are looking as usual and yielding the usual quality of ore. The upraise from the 700-ft level to the 1000-ft level has been attained a height of 185 feet on the inclination of the vein. The 1150-ft level south drift is making good progress, with the face in quartz carrying streaks of ore.

**CON. EAST JUSTICE.**—This is a consolidation of some valuable mining locations lying to the eastward of the Alta, northward from the Sucker and Silver Hill mines, and east of the Teller mine. It is a fine body of ore, and is east or bonanza ore channel of the Comstock. All preliminary preparations having been completed, work is actively commenced by sinking of a three-compartment shaft at the most eligible point.

**GOULD & CURRY.**—Connection between the south drift at the 1900-ft level and the drift north from the Savage joint winze was made on Monday evening, a small opening being made. Since then the opening has been enlarged to the full size of the drift, and a fine and very much needed circulation of air is established, the draft being southward and up through the joint winze. Sinking the main Gould & Curry incline is discontinued at present on account of too much water.

**WHITE LEAD.**—This company is among the most recent incorporations in the mining group. Its ground is located about 1,200 feet east of the Alta and the same distance north of the Sucker. It shows a well-defined ledge running the entire length of the claim, and it is evidently the white lode from which mining experts expect so much.

**JULIA COV.**—The main drift south, at the 1900-ft level, is pushing ahead at the usual lively rate in good, healthy quartz, giving a fine yield. Cross-cutting a 500-foot west wall, the shaft, has reached the ore vein, 70 feet west from the main drift south, and is 20 feet into the ore vein, showing low-grade quartz thus far. It has 70 or 50 feet to go in order to reach the west wall.

**SAVAGE.**—The work of putting the pumps in place is being urged forward as energetically as possible, and the prospects are good for completion this week.

**LETITIA.**—Everything in this mine is going well, and the engine will be started up to-morrow morning. The hoisting or gallow frame is built strongly and is 20 feet higher than the old one.

**BULLION.**—Sinking the incline below the 1500-ft level is making four feet a day, no water being encountered. The east cross-cut on the 1700-ft level is making fair progress in more favorable conditions than heretofore met with. **IMPERIAL COV.**—Good work is being done sinking the south winze below the 2125-ft level to connect with the north drift from the 2200-ft level of the Yellow Jacket.

**SOUTH COMSTOCK.**—Work actively resumed with three shifts of men. The water is all out and cross-drifting at the 200-ft level is commenced to intersect the vein.

**BELCHER.**—Face of south drift at the 1900-ft level in porphyry and streaks of quartz carrying some ore. **SILVER HILL.**—The drift south at the 1750-ft level is progressing well, and the mine from the 1500-ft level to connect with it is making good sinking progress.

**CROWN POINT.**—The ore yield from the 1600-ft level of the old upper mine holds out better than was expected and is likely to extend some distance downward.

**FRANK.**—At the 1150-ft level the main drifts north and south are making the usual good progress. Face of south drift in hard rock; north drift in softer material.

**TRIX PRICKS.**—Preparations are being made for resuming sinking in the new shaft; also for the erection of steam hoisting works. The old mine drifts and cross-cuts are being cleaned out.

**HOMERSTAD.**—On account of doing certain necessary work on the surface but little progress has been made in sinking the main shaft during the past week.

**SILVER HILL.**—The shaft at the 50-ft level is completed, and drifting toward the ore vein is well started.

**UNION COV.**—Repairs on 1300-ft level completed and work in east cross-cut commenced.

**EXCELSIOR.**—The consolidation north drift on the 2000-ft level is making excellent headway in a mixture of porphyry and quartz.

**LADY HIRSH.**—The financial difficulties of the company will soon be properly arranged, when the new machinery will be started up and then the development of the mine will be actively proceeded with.

**ORION.**—Work on the 1900-ft level is being pushed ahead without change of material encountered.

**CALIFORNIA.**—Some improvement is noticeable in the drift north at the 1400-ft level.

**ALTA.**—Still cross-cutting on the 1050-ft level. Cross-cut No. 1 has good ore. Cross-cuts Nos. 2 and 3 do not show so favorably.

**OVERMAN.**—Drifts south and east on the 1300-ft level making good progress and promising well.

**HALE & NORCROSS.**—Pumps and machinery working well, and good progress will be made in reducing the water when the Savage pumps assist, which will be the last of this week.

**NEW YORK.**—Sinking the shaft below the 500-ft level continues. The bottom is in very promising vein matter.

**SECOR.**—The bottom of the shaft is in soft vein porphyry streaked with quartz giving low assays. The prospect is very encouraging.

**SUNNY TOWN.**—Total length of tunnel to-day, 13,023 feet. Main face of header soft ledge porphyry, clay and quartz.

**NIAGARA.**—Cross-cutting at the 500-ft level develops some very fine stringers of ore, giving high assays.

**JOE SCATES & GEORGE DOROLANS.**—Sinking the main shaft is progressing well, all in fine looking quartz.

### BRISTOL DISTRICT.

**MAYFLOWER.**—Pioche Record, Sept. 29: The Mayflower mine of Bristol district has now reached a depth in the incline of 175 feet; have been running in ore the last 45 feet; have made an upraise from the main incline at a depth of 150 feet, the upraise being 23 feet, all in ore. The face of the main drift is in all in ore, to the height of the drift. From samples taken from the mine by E. B. Dorsey, assays were made ranging from \$58 to \$235. The mine is worked regularly by day and night shifts. The company is a home corporation.

### ELY DISTRICT.

**RAYMOND & ELY.**—Pioche Record, Sept. 29: No especial changes to note in the mine; work continues about the same as usual, with rather more than the usual quantity of ore being extracted. The ore now being extracted is working well at the mill.

**PERKINS.**—The Bullionville furnace has been closed down and is being thoroughly overhauled and relined. This will take over a week's time.

**PIOCHE BELLION.**—Wells, Fargo & Co. shipped during the week bullion valued at \$11,534.

**YESTERDAY** was pay-day of the Raymond & Ely employees.

### JACKRABBIT DISTRICT.

**THE SALE CONSUMMATED.**—Last Wednesday the sale of the Jackrabbit mine to M. J. McDonald and James M. Day by Garrison and Emory for \$40,000 and a one-tenth interest in the stock of the incorporation was finally completed. The deeds signed, acknowledged and delivered. E. B. Dorsey had been sent to Pioche as an expert to report on the mine to McDonald and others about to purchase, and he was agreeably surprised and pleased at the extent and body of ore disclosed to sight; it made a favorable impression as to its value, so that he reported favorably of the purchase being made, on receiving which report the bargain was closed and possession given on Wednesday. Mr. Dorsey was formerly Superintendent of the Mexican mine and mill at Virginia. On Thursday E. B. Dorsey was appointed to take charge of the mine and work commenced in good shape. A large amount of ore is now sacked on the dump and will soon be sent to the mill.

**ROYAL CITY.**—Owing to the recent sale of the Jackrabbit mine and taking charge of it by a San Francisco company, the rush and business incident to a promising new mining camp is taking place at Royal City.

### TUSCARORA DISTRICT.

**SILVER PRIZE.**—Tuscarora Times, Oct. 6: Quite an excitement was created in town, on Wednesday, by the striking of a rich stratum of gold-bearing quartz at the bottom of the incline of the Silver Prize. The ore was not only rich in free gold, but also carried horn silver, intermixed with sulphurates. Some very fine specimens were obtained. The incline of the Silver Prize is now down about 120 feet, and has a continuous ledge from the top, widening out to about three feet at bottom.

**TUGA AMERICA.**—On the 30-ft level the drift is in upwards of 300 feet, the full length showing from one to three feet of good milling ore.

**NAVJO.**—Main shaft down 175 feet, encountering a large volume of water, making progress necessarily slow.

**GRAND PRIZE.**—The hoisting-works building nearly completed and machinery been running several days. Water still running on from the lower levels.

**RICH ASSAYS.**—On Monday last, while drifting on one of the lower levels of the De Fries mine, a body of good milling ore about four feet in width was encountered.

**TUSCARORA.**—A contract has been let to sink a new shaft, and work was commenced on the same yesterday. In the old workings the ledge looks promising and shows considerable mineral.

The Grand Prize company have shipped, during the present week, nine bars of bullion, valued at \$13,313.

The Leopard company have shipped two bars of bullion of the value of \$3,516.51.

### WHITE PINE DISTRICT.

**GOLD ASSAYS.**—White Pine News, Oct. 6: Col. Tyson, of the King mining company, who began working during the week in making assays of the ores of the company and those of adjacent mines, informs us that he is well pleased with the result of his experiments. Assays from the ore vein recently struck in the bottom drift of the King give respectively \$216 and \$345 per ton.

**PAY DAY.**—The Jennie A. employees were paid off last Tuesday. The amounts that are monthly paid out by this company and the King is a great help to this camp just at this time, and we hope to soon see their forces increased.

**BULLION SHIPMENT.**—Last Tuesday the Eberhardt & Aurora shipped by Wells, Fargo & Co. bullion valued at \$11,655.92. The Stafford company shipped \$6,075 the same day.

## Arizona.

**ITEMS.**—Arizona Enterprise, Sept. 29: The Alchabarro, Tazulito, Bonito, Unicorn and Sentinel are reported to have been sold to Messrs. Hoffman and De Grano. In the lower north tunnel in the Peck mine some exceedingly rich ore has been struck. Two bars of bullion were shipped yesterday by the Peck company. They were valued at \$3,224.63. Work is progressing rapidly on the Tiger.

(Continued on page 238.)

## THE ENGINEER.

### Painting Iron Work.

At a recent meeting of the Liverpool Engineering Society, an address of much practical value was delivered by C. Graham Smith, President of the society. We take therefrom a few paragraphs on painting iron work: The paints used for iron work are of every description, name and quality. The usual varieties employed for preserving it against corrosion may be divided into lead, iron oxide, silicate, and tar paints. Differences of opinion exist as to the relative merits of the first three descriptions, but the experience of several foremen painters connected with establishments in this town, is decidedly in favor of lead paints when of good quality and mixed with good oil without spirits. Unfortunately there are no reliable practical tests to insure good materials alone being used; consequently both the colors and the oils are often inferior in quality, and much adulterated. For these reasons and on account of cheapness iron oxide paints are by some preferred.

A little white lead mixed with the red makes it go farther, and easier to work into corners. If the coats are put on with pure red lead owing to its weight it is liable to run off; but the last coat should consist of red lead alone.

The tar paints are more often used for iron work which is not to be seen, such as water pipes, floor plates of bridges, and girders which are to be built into masonry or brickwork. It is cheap, and answers well for such purposes, and for sea work as it is said not to foul so readily as lead or other paints of a finer description.

A good rough paint of this class may be made by heating ordinary coal tar, and mixing with it finely sifted slacked lime, in the proportion of between half a pound and a pound of lime to a gallon of tar, adding sufficient naphtha to render it of a convenient consistency for laying on. This composition should be applied while hot, but care should be taken not to make it too hot, nor to keep it over the fire too long, or it will lose its essential oils and be reduced to a substance in all points resembling pitch. Some positions admit of the paint being sanded, in which case it should be done as it adds to its durability.

Before painting iron work it is usual to give it a coat of boiled linseed oil applied hot, this forms a kind of varnish and is found to be an excellent preparation for the after coats of paint. Opinions differ as to when the coat of oil should be applied. Some engineers specify that the iron shall be brushed over or dipped in oil while hot from the rolls. The efficacy of this method is doubtful as the iron in undergoing its workshop manipulation is subject to rough treatment, and portions of its surface are sure to become exposed. Others specify that the iron shall be brushed over with hot oil just previous to the various portions being placed together. This answers well for ordinary work, as by the time it has gone through the workshops the blue shales have to some extent been knocked off.

These blue shales are in a greater or less degree inseparable from the manufacture of the iron; but it is very important that they should be removed by some means or other before the paint is put on, for if not, in a short time they will peel off and bring the paint along with them. The best way to guard against this is to have the iron work put together in the yard and tested previous to either oil or paint being put upon it. A slight rust will form over the whole surface of the work, which will cause the blue shales to fall off. The rust should then be scraped off and the whole of the work rubbed down, which will render the surface peculiarly fitted for receiving the after coats of oil and paint. The oil should follow up, as closely as possible, the man cleaning the work. It is almost needless to point out that the efficiency of this method entirely depends upon the thoroughness with which it is done, and no engineer is justified in specifying it unless he proposes putting an inspector to see that it is properly performed.

### Statistics of British Railways.

The usual annual report to the Board of Trade for the last year respecting the share and loan capital, traffic, working, expenditure, and net profits of the railway companies of the United Kingdom for 1876 was issued on Wednesday. The total railway mileage for the United Kingdom at the end of December, 1876, was 16,872 miles, including 11,989 miles for England, 2,726 miles for Scotland, and 2,157 miles for Ireland. The increase for the United Kingdom over the total in 1875 is 214 miles, much the same amount of increase as in 1875 over 1874. The total nominal capital of the railway at the end of December, 1876, was £658,214,776, compared with £630,223,494 at the corresponding period of 1875. A portion of this increase is only nominal, being due to conversion operations. It is shown in the report that there is a steady increase of the capital cost per mile of open railway in the Kingdom, caused, to a great extent, no doubt, by the addition of sidings and other accommodation to existing lines to meet the increasing traffic. In 1871 the capital expenditure per mile of railway open was £35,943; in 1876 it had risen to £39,012. The amount of the guaranteed and

preferential capital was in 1876, £228,907,902, or an increase of £16,714,668 as compared with 1875, while the amount of the loans and debenture stock was £167,297,901, or an increase of £3,868,463 as compared with 1875. The amount of the ordinary capital again in 1876 was £262,008,883, or an increase of £7,468,151 as compared with 1875.

The total receipts from railway working, excluding miscellaneous receipts of various kinds, amounted to £59,917,868, or an increase of nearly a million over the previous year; the working expenditure at the same time amounted to £32,472,729, or an increase of £274,000 over the previous year; and the net earnings amounted to £27,445,139, or an increase of £661,000 over the previous year. This last increase is at the rate of two and one-half per cent. only, while the increase of nominal capital amounted to about four and one-half per cent.

### Military Bridge Building.

Very extensive bridging operations have been recently carried on on the River Elbe, by the engineers of the German army. Among other exercises gone through, says the *Iron Age*, was one of particular interest at the present moment, namely, the construction of a pontoon bridge across the river Schonebeck during the night. Nine companies of pioneers, numbering altogether 44 officers and 800 workmen, were assembled on the occasion, but only four companies were actually employed in the construction of the bridge, the remaining five companies being previously passed across the river on rafts and extended as an advance guard on the assumed enemy's side to cover the operation. The rafts employed for this preliminary operation were formed each of two pontoons coupled together. Four oarsmen and one steerer were employed on each raft, and each one carried from 35 to 40 men with their arms and accoutrements. The time occupied in thus throwing the advance guard across the river was about a quarter of an hour. The tactical idea for the manoeuvre was that the main body of an enemy's army was distant about a day's march from the Elbe, but that patrols pushed forward by him had arrived in the immediate vicinity of the river. It was therefore essential that the bridge should be constructed without these latter becoming aware that the operation was being carried on at the particular point chosen, and, consequently the utmost silence, not only in giving orders, but also in putting the material together, had to be observed. The bridge was constructed by sections of four pontoons each, in order that, should the enemy appear in force before a sufficient number of men had passed over to offer resistance, it might be readily withdrawn, and the whole task was successfully achieved, without a hitch of any kind occurring, in the space of an hour and a quarter, an opening being also arranged in the middle of the bridge to allow floating bodies to pass through.

**IRON RAILWAY SLEEPERS.**—A contract has just been let at Amsterdam for the delivery of 20,000 iron sleepers to the Netherlands State railways. The price named in the accepted tender was £6,499, the 20,000 sleepers weighing about 800 tons. It should be observed, however, that the sum named in the contract comprises the delivery and laying of the sleepers, so that the price of the sleepers at the German works may be estimated at about £5 per ton. The sleepers to be laid on the Netherlands State lines are on the Vantherin system, 10,000 of which were recently tried on the Belgian State system, and rejected after a careful trial. It is, perhaps, a little strange that the Dutch authorities did not take account of this circumstance. It is stated that the Great Central Belgian Railway Company contemplates a total discontinuance of wooden sleepers upon its system.

**OLD MORTAR.**—At the last meeting of the Liverpool Engineering Society, Mr. Wilkinson Squire, brought before the members some interesting samples of mortar. A piece from Sandown Castle, Kent, built by Henry VIII., was tested by Mr. Squire, proved to stand a tensile strain of 263 lbs. per square inch, the section tested being 1.8 square inch in area. A sample of mortar lately brought by Mr. Alfred Holt, member, from Neapolis, a city built B. C. 40, to commemorate the battle of Actium, appeared to be as hard as stone. The president thought that, on account of its rough and honeycombed appearance it bore out his theory that the goodness of ancient mortar was due to the quality of the materials rather than to any particular care then bestowed upon its mixing.

**SHORTENING THE ROUTE TO EUROPE.**—Another project intended to shorten the ocean journey between America and Europe is taking definite shape in Canada. It consists in the construction, now underway, of a branch from the Inter-Colonial Railway at Truro, N. S., to Louisbourg, Cape Breton. This port being some 200 miles nearer than Halifax, it is claimed that freight steamers which now pass Louisbourg on their way to and from Quebec and Montreal, but do not pass Halifax, can carry cabin passengers from England to Louisbourg for \$30—about the present rate by the mail steamers for steerage passengers. It is also argued that when the mail steamers cannot enter the gulf through the Straits of Belle Isle they can land their passengers and mails at Louisbourg, saving 36 to 48 hours.

### The Durability of Iron.

Major E. T. D. Myers, General Superintendent of the Richmond, Fredericksburg and Potomac railroad, has sent the *Railroad Gazette* a report of the tests of a bar of iron, which, he writes, "had done duty for more than a quarter of a century in a railroad bridge in this State. It has not crystallized in that service, although strained very frequently in every 24 hours with loads of more than 20,000 lbs. per square inch, and not unfrequently with those equal to if not slightly in excess of the elastic limit as now ascertained by experiment." A piece of this rod, 2 feet long and 1½ inches diameter, was tested by Col. D. W. Flagler, under the following conditions and with the result stated: The diameter of the sample was 1.13 inches, which we infer means that the piece of bar was turned down to that size. The area of cross section was 1.0028 inches, and the length between shoulders 10 inches. This sample was subjected to a tensile strain of 1,000 lbs., or 997.2 lbs. per square inch of section. This was then taken off and increased 1,000 lbs., and this was repeated until the bar finally broke, the load being increased each time 1,000 lbs. To quote the language of Col. Flagler: "Each time after the load was put on the bar the extension was measured and the load was taken off and the restoration was measured." The test piece did not take any permanent set until it had been strained 28 times with a load of that many thousands pounds, or 27,923.6 lbs. per square inch. Up to 36,000 lbs. "the permanent set was almost inappreciable." With a load of 39,000 lbs., or 38,891.4 lbs. per square inch, the iron began to fail rapidly. At a strain of 54,250 lbs. per square inch of original section it broke, having stretched 2.44 inches, the diameter of the fracture being 0.893 square inches, so that the strain per square inch of fractured area was 60,750 lbs.

### The Pittsburg Mine.

The company owning the Pittsburg, or old Wigham mine, located on the slope of the hill about a mile and a half southeast of this city, have recently incorporated. The capital stock is divided into 100,000 shares and placed at the value of one dollar per share. On Tuesday says the *Nevada County Gazette*, we visited the mine, and after looking things well over we do not hesitate to predict that before two years rolls around it, will sell for several times its present valuation. The hoisting works which have been put up since the present company took hold of the mine and which took the place of the ones burned a few years ago are complete in all their appointments and there is power sufficient to work the mine to a depth at least of 1,500 feet. The mill has ten stamps of 700 pounds each, and the engine has power to work ten more when needed. The mill is being improved now and some improved machinery is being put in for saving gold and sulphurets. There is a National drill being used to sink the incline, which drill was some time since purchased by the company. The incline is now down 790 feet, or 90 feet below the 700-foot, or lowest level. On the south side of the shaft from the 700-foot level upward the rock has been worked out and according to the books of the former owners paid on an average \$30 per ton. There are three paying chutes in the mine, the one on the south side being the one which was worked out down to the 700-foot level. The middle chute is now on the north side of the shaft and is in the neighborhood of 220 feet in width. The North chute is over 50 feet in width. The middle chute has been worked partially out down as far as the 600-foot level. We saw some of the rock hoisted from this chute from a winze being sunk from the 700-foot level, while at the mine, which is the best we have seen in the district for years. It was heavily sulphureted and free gold just glistened through most of it. The ledge at the point from which it came is two feet in thickness and is composed of compact ledge matter. The shaft last night was down 800 feet, and from this point new drifts will be run north and south to open the south and middle chutes of ore. We are of the opinion that from this level up to where the ground has been worked out above, there will be gold enough extracted to go well toward paying for the property at its present valuation. On both sides the shaft and in all three chimeys the rock is looking splendidly. Miners who were employed in the mine formerly, say they never saw better looking ore come from it, and the width of the deposits are nearly double what they used to be nearer the surface. It will be remembered by old residents here that S. D. Merchant, while in charge of the mine took out 1,700 tons of ore which yielded in the aggregate \$102,000, being an average of \$60 per ton, and all the rock was taken out above the 400-foot level. Capt. White the present efficient Superintendent, is about to put in three improved concentrators which will dispense with a couple of men now employed to rock sulphurets, and below the mill he is having a huddle erected. He expects to employ a large number of men as soon as the incline reaches the 800-foot level, and will work the property for all it is worth. We feel confident in asserting that the mine is today one of the best in the county, and it affords us great pleasure in being able to make the assertion. We hope other San Francisco capitalists will be equally fortunate in their investments as the owners of the Pittsburg were when they made their purchase.

### The Greatest Mining Tunnel.

After 33 years of uninterrupted labor, the great undertaking of the Rothschoenberger water adit is so far completed as to admit of its use. Our readers are especially interested at the present time in enterprises of this kind, the approaching completion of the great Suto tunnel having called attention to the merits of this plan for working and draining deep mines. For the facts relating to the subject we are indebted to the *New York Stockholder*.

The method of draining the Frieberg mines by means of a deep tunnel had already been discussed in the beginning of the present century as a question of necessity for the future mining prosperity of the vicinity; and undoubtedly the Rothschoenberger tunnel is the greatest work of the kind that has ever been undertaken to aid the exploration of a mining district. Other great adits, such as those of the Hartz mountains, fade when compared with a tunnel which has already attained a length of more than 26 English miles, and will be with its branches when completed 31½ miles. The plan was to conduct the water from the Frieberg mines to the nearest practicable point on the river Elbe. Rothschoenberger, 12 kilometers above Meissen, was chosen as the most advantageous place for the mouth, on account of its having the lowest level at the shortest distance from Frieberg. The preliminary surveys were made in 1843, but the work was not thoroughly taken in hand until the third quarter of the year 1844. Since that time the driving of the tunnel has been unceasingly carried forward, but coupled with many hindrances and difficulties, such as quicksands, immense quantities of water, etc., which have trebled the cost and retarded its completion.

The tunnel is ventilated by eight air shafts, and lies some 400 feet below the deepest Frieberg water adit. It has a uniform height of 9.83 feet, with a somewhat similar breadth. The present length of the adit with its ramifications is 43,000 meters (all of which length is now in use) and will be when completed over 51,000 meters, or 31½ miles. The cost of the tunnel is estimated at 12,000,000 marks, or \$4,000,000, and will be paid by a tax on all mines which it directly benefits. The gradient of the floor is only 0.03m. in 100 meters. This small gradient may make it necessary to clear the tunnel occasionally, but this can be accomplished without difficulty with suitable boats and dredges. Five miles of this tunnel are perfectly straight, without the slightest curve, and along the whole length the curves are very light. One rather interesting occurrence during the past year was the striking of an old mine, of which no maps are in existence. This mine is probably more than four centuries old, and the timber which had been used as supports, etc., was found for the most part sound. Two new veins were also struck, but only one of them will be exploited. It is rather remarkable that nearly the whole driving of the tunnel has been done by hand, Burleigh drills driven by compressed air, having been introduced only within the past year. The rock throughout nearly the entire length is solid gneiss, which accounts for the great time that has been taken to the work, it being necessary with hand boring, to put in as many as from 40 to 50 holes to the face.

The necessity for the continued prosperity of the Frieberg mines, which have now been worked for about seven centuries, may be gathered from the fact that at the present time there are more than 6,000 laborers, with their families, amounting altogether to some 22,000 persons, who derive sustenance from the mines and metallurgical works connected with them. It may reasonably be expected that the Rothschoenberger tunnel will give fresh impetus to the Frieberg mining, and considerably augment the output of ore, which has of late years somewhat fallen off, owing to the immense quantities of water which continued to flood the mines, and prevented the veins of ore from being followed and worked below a certain depth.

**A WATER WHEEL AT WORK.**—A turbine wheel has been started up at the mouth of the Suto tunnel, which runs the machinery of the machine shop, the blower in the blacksmith shop and the printing press. The wheel is placed in the bottom of a shaft 60 feet in depth and is run with water from the tunnel. A tunnel from the bottom of the shaft carries away the water that has passed through the wheel. The wheel makes 1,000 revolutions per minute and has been christened the "Little Joker."

**ANOTHER LEDGE STRUCK.**—Friday last at 12 o'clock Maurice Hartnett and Alex. Fraser struck the Magnet ledge at a depth of 14 feet, and three and a half feet thick. It is a very rich vein of carbonate ore, assaying \$200 in gold and silver, and carrying 33% lead. This makes the third mine that has struck the ledge upon Prospect mountain during the past week, with rich and encouraging developments. *—Eureka Republican.*

**THE BRIDGE AT YUMA.**—The *Arizona Sentinel* states that the S. P. R. R. bridge over the Colorado river is 480 feet long, with a draw of 187 feet. Over 100,000 pounds of iron rods are used in bracing it together. Every span is an independent truss by itself. The piles are of cedar 14 inches square, and driven to a depth of 26 to 32 feet each. Experts say that there is no better wooden bridge in the United States.

## A Resuscitated Mining Camp.

A correspondent of the Gold Hill *News* writes as follows from Bodie district, Mono county: A trip to Bodie involves a deal of personal discomfort, annoying dust, heat and extreme cold, especially while passing through the Stillwater country.

Aurora bears many evidences of past prosperity in the shape of six or seven large brick buildings, costing all the way from \$30,000 to \$60,000, while quite a number of brick dwellings far superior to the houses of the same kind in Gold Hill are scattered around on the sides of the canyon in which the town is built. After a short stoppage we passed down the canyon in which were four or five large fine brick mills, erected at the cost of \$200,000 or \$300,000 each. Alone, silent and deserted they loom up, impassive relics of former prosperity and of the days when \$12,000,000 to \$14,000,000 were produced from the outlying hills around Aurora.

The road now turning abruptly to the left, the horses subsided into a slow walk and a weary climb commenced through a seemingly endless, winding canyon, through which a small stream wound its crawling course, crossing the road at almost every turn, while, on either hand rose the canyon sides covered with loose, float, rugged crappings, of a spotted hue, and therewith the common pine-needle trees of the country. As we continued the trees became scarcer, and the stream less and less until it became mere thread and at last rocks and trees ceased and the mountains became less steep. We came upon a small plateau just below the town of Bodie, while at our left, at the base of one of the largest hills, stood the Syndicate mill, in full operation.

Ascending still on an easy grade for a mile the town of Bodie was reached. It is situated on a level spot of ground, only very low hills joining its boundaries. To the east of the town stands Bodie hill, on which the principal mines are situated; the Standard, Bechtel, Syndicate and the Black Hawk mines. The relics of Governor Blasdel's mill, or rather the foundation, shows on what a good spot a mill could be placed, but when the stampede from here took place everybody lost faith. It would now be the most profitable one in the State, for the Standard mine alone is opened in such a manner that 100 stamps would not annoy it at all, except that the assayer would have a considerably larger amount of bullion to melt.

They play now a very mean trick on the road agents, by making the bars 120 pounds each, which makes them very awkward to handle, so that the stage robberies are not likely to be profitable.

**SKIDMORE'S TUNNEL.**—Our old friend W. A. Skidmore writes as follows to the *Mountain Messenger* about the natural tunnel in Plumas county, about which he has stood a good deal of chaffing by doubting acquaintances: "During a trip of observation through your county, two years since, while on the old trail between Downieville and Forest City, in company with Mr. Charles Hendel and Mr. Joseph Gibson, of Scales, our attention was attracted to a natural tunnel through a distant range to the northward, apparently near the Plumas line. The weather was clear, and from our point of observation we saw daylight through what appeared to be the apex of a distant range. I published in the *MINING AND SCIENTIFIC PRESS*, of San Francisco, a brief statement of this natural phenomenon. This has recently been the subject of some facetious remarks in your journal, resulting, probably, from the obtuseness of our friend Stokes, of the Exchange hotel, Grass Valley, who, on the occasion of your recent visit, got his ideas and "other things" slightly mixed, and could not tell the difference between a tunnel thirteen miles long and a tunnel thirteen miles distant from our point of observation, thereby impeaching the veracity of myself and Mr. Hendel. Apropos of this matter, permit me to reiterate the existence of this tunnel, and to designate its locality, as demonstrated by actual observation from the other end. It is situated near the apex of Eureka peak, Plumas county, at an altitude of 7,000 feet above the sea level. Like Mercurio's wound, it is neither as deep as a well, nor as wide as a church-door, but it will serve to redeem our reputation for veracity. If you don't believe it now, go and look in the other end of the tunnel, as I have done, or forever hold your peace."

**BONANZA MINES.**—The developments in these mines continue more and more a surprise as the bonanza itself is explored and developed. The *News* says there appears to be absolutely no end or boundary to it. Those mines have been most admirably managed, the Superintendent keeping his explorations at least two years ahead of his ore developments, and not waiting to work out one section of ore before finding more. There is so much ore in sight in those mines, and accumulated at the various mills that without increased milling facilities there is not work enough for the men employed in them, consequently quite a number are being discharged.

**RATHER CURIOUS.**—Some time since, says the Gold Hill *News*, when the pumps of both the Savage and Hale & Norcross mines were running at their best speed, accidents happened by which both pumps were stopped for a time. The pumps had no sooner stopped than the water not only ceased to rise, but actually went down three feet of its own accord.

## USEFUL INFORMATION.

## The Pearl Supply.

The results of the Ceylon pearl fishing carried on during the months of March and April of the present year, says the *British Trade Journal*, are reported to have been very satisfactory, the yield of oysters having been larger than in any season since 1855. The banks known as the South-East and East Cheval Pairs and the Modregam Paar were selected, after examination, as being in the best condition for fishing, and nearly 7,000,000 oysters were brought up in the 30 days on which diving was carried on. Active operations were interrupted by bad weather on two days only, and, although the government had given notice of only 15 days' fishing, the oysters were found to be so plentiful that the diving was continued for twice that length of time. Over 1,500 boats were engaged in the fishery, of which, however, only 130 were "diving" boats, and of these 100 were selected for the fishing, and sent out in two divisions of 50 each on alternate days. The anticipations of a poor season had restricted the attendance of divers, and as only about 50 of these appeared, they had to work every day, instead of, as usual, on alternate days. Only one-fourth of the oysters brought up go to the divers' share, the remaining three-fourths going to the government, and being sold day by day to the dealers and traders who attend the auctions from all parts of India, and even from China and other countries. The average rate realized was 36 rupees, or £3 12s per 1,000 oysters, and the total produce of the government share was about 190,000 rupees, or £19,000, or nearly double the estimated yield. The results of the fishery in 1874 was only 1,700,000 oysters. Silavaturai is the headquarters of the fishery, and 4,000 or 5,000 persons were brought to the village in connection with the fishery. The produce of pearls was very good, many large and valuable specimens having been found. The method adopted for obtaining the pearls is to place the oysters in a large vessel called a ballam, and allow them to remain there till the fish becomes putrid, when the shells are easily separated, and the mass being washed in water, the pearls fall out and are picked up. The excellent results of the late season's fishing are attributed to the measures adopted by the Ceylon government for periodically inspecting the beds or banks of oysters, and arranging for the fishing of those only which are found to be in a "ripe" state for fishing. A pearl bank may be either too young or too old to produce good pearls, and it is only by careful examination of the ground and a periodical selection of samples that the proper time for fishing can be ascertained. At present it is the custom for a bed to be fished only once in three years, and the Cheval Paar and Modregam Paar, the scene of this year's operations, will certainly not be fished again till 1880.

**CURIOUS MECHANISM.**—A monk of the Benedictine monastery, at Raigern, between Brunn and Vienna, has completed a mechanical curiosity in the shape of a self-moving terrestrial globe, 1.4 meters in diameter. A combination of wheels gives it a motion similar to that of the earth, and when once set going it will revolve for three weeks. At the north pole of the axis are dial plates, on which the days, months, etc., are indicated, and over these is a smaller globe, by means of which the motion of our planet round the sun is exhibited. The larger globe sets the smaller one in motion by the agency of 12 wheels. The construction of the mechanism took more than 10 years' patient application, and was only completed after numerous experiments. As regards geographical details, the map on the globe is carefully drawn, and shows all the latest discoveries. The steamer routes, railway, telegraph lines, heights of mountains and the depths of the ocean are all distinctly shown. By a somewhat odd conceit, the year in which the globe was begun (1866) can be ascertained by re-arrangement of certain letters of the Benedictines' motto inscribed on it: "In hoc, sicut in omnibus, glorificetur Deus." The maker of the globe is a self-taught mechanic and artist, who, during the past 30 years, has adorned the monastery with numerous examples of his skill and ingenuity.

**THE DUKE AND THE WORKMEN.**—The Duke of Bridgewater was fond of watching his men at work, and when they were boring for coal at Worsley, he attended every morning and looked on for a long time together. The men did not like to leave off work while he remained there, and they became so dissatisfied at having to work so long beyond the hour at which the bell rang, that Brindley had difficulty in getting a sufficient number of hands to continue the boring. On inquiry he found out the cause, and told the duke, who from that time made a point of walking off when the bell rang, returning when the men had resumed work, and remaining with them usually until six o'clock. He observed, however, that, though the men dropped work promptly as the bell rang when he was not by, they were not so punctual in resuming work. He asked to know the reason, and the men's excuse was that, though they could always hear the clock when it struck 12 they could not so readily hear it when it struck only one. On this the duke had the mechanism of the clock altered so as to make it strike 13 at one o'clock.

## Preventing Boiler Scale.

We read an essay by Stephen Roper in the *Iron Age*, and take therefrom a specific for the prevention of boiler incrustation, which is said to be the basis of many of the compounds largely sold for this purpose. Mr. Roper says: Hemlock, oak, logwood and mahogany sawdust are frequently used for the prevention of scales with very satisfactory results, as the tannic acid which these woods contain has a tendency to mix with the scale-forming ingredients, to render them more light and porous, and consequently to prevent them from forming in hard, solid masses. The sawdust and bark of these woods have no chemical action on the iron of the boilers, but only tend to preserve it. It is very common to find boilers, located on streams in the vicinity of saw mills, entirely free from scale. In fact, refuse logwood, mahogany or oak sawdust, sal soda, ash and yellow ochre form the base for nearly all the patent compounds and solutions now in use for preventing and removing scale from steam boilers, coloring matter being added for the purpose of preventing steam users and engineers from discovering the ingredients from which they are made.

The following recipe will be found to contain the ingredients most generally used for preventing the formation of scale, and may be relied upon as the most safe, simple and efficient remedy now in use: 100 pounds of refuse logwood, mahogany or oak sawdust; 20 pounds of sal soda; 10 pounds of yellow ochre. The sawdust to be dry, mixed with the sal soda and ochre, and ground in a burr mill to the consistency of shorts used as horse feed. It may then be introduced once a week, in seven-pound charges, the first five weeks, and five-pound charges once a week afterward. It may be introduced either through the safety valve or man-hole, or the same ingredients may be placed in a tank or cistern, covered with water and allowed to remain for 48 hours, when it may be allowed to percolate or filter down into barrels, and be introduced through the pump in quantities of about three gallons per day.

**BOILED EGGS.**—Hard boiled eggs have always been considered more difficult of digestion than soft boiled ones. The reason is this: the white of an egg is almost pure albumen. Now albumen coagulates with heat, and is not so readily acted on by gastric juice; so that much of it passes from the stomach undigested. Persons with vigorous digestion may manage a hard-boiled egg so as to extract most of the nourishment from it, if it be well masticated and mixed with other food. The yolk of the egg, however, is not rendered worse by hard boiling. Eggs boiled just four minutes leave the white part in a partly flocculent condition, more easily digested, and not so soft as to be offensive to any one. An egg may be cooked in water at a temperature of about 165° Fah. for 15 minutes and leave the yolk well cooked, but the white will not be rendered tough and hard to digest. Though more troublesome, this is a good way to cook an egg to render it easy of digestion as well as palatable. Persons whose palates will not tolerate a soft-boiled egg should have them poached and dropped on toast.—*Dr. Holbrook.*

**PURIFICATION OF WOOL.**—The process, patented some time ago, for the removal of straw, burrs, etc., from wool, by treatment to sulphuric acid, has been modified by Lise, as follows: The stuff is worked for one or two hours in a bath consisting of about 26 gallons of sulphuric acid, of three to six degrees, one pound alum, half pound salt and 750 grains borax. It is then treated in a centrifugal machine, and afterwards subjected to a temperature of 212° to 248°. For removal of the acid it is first washed with pure water for an hour and a half, then treated for two hours with fuller's earth, soda and lime, and finally washed for two hours with fresh water. As sulphuric acid can only be employed with uncolored cloths, or such as have been dyed with indigo, chloride of zinc and chloride of manganese diluted to six degrees are substituted with fabrics otherwise dyed.

## GOOD HEALTH.

## Don't Poison the Babies.

**EDITORS PRESS:**—There is among us a fashion still prevalent, a relic of the dark ages, in accordance with which, when a person dies from an infectious disease, the disaster is attributed to a "visitation from God." Alas! for the paganism of Christians! Even among those of us whose faith is placed in a God of love, who delights in the well-being of his creatures, there is a strange amount of ignorance as to the origin and prevention of diseases. In spite of our school children receiving instructions in all the "ologies," not one man or woman in a hundred seems to appreciate the necessity of keeping their premises sweet and wholesome, not one in a hundred knows the way to do so, simple and inexpensive as it is.

There is too much false modesty and too much false delicacy in our midst. Such necessary but unpleasant things as privies and cesspools must be spoken of in bated breath; their existence must, as far as possible, be ignored. A woman may see her children die from

Diphtheria, Typhus and Cholera, And hear their deaths attributed to the myste-

rious ways of Providence, when there is no mystery whatever in the case. The children were poisoned by the death-dealing miasma arising from the neighboring cesspools. In heart anguish she disinfects her house, fumigates, scrubs and scours, but the cesspool, which has received all the contagious excreta, is left to fester and rot and spread the contamination on all sides.

Here, in our county (and, no doubt, all over the State the thing is the same) are mothers, all terror stricken for the lives of their little ones, and no one comes forward to say boldly that it is to the filthy uncleanness of the whole community that these dire diseases are mainly due. Is it credible? Or is it creditable to our boasted civilization, that barely a town on this coast has any decent sewage arrangements or takes any precautionary measures against these man-bred demons of "zymotic" disease? The word "zymotic" speaks for itself. It means that which spreads from a ferment, as yeast spreads in dough. The ferment for these diseases works in the festering corruption of our cesspools and privies. The resulting miasma poisons the air, while the seepage poisons the water, and the

## Black Death

Seizes another victim and yet another. The remedy for all this is as simple as the diseases are dire. Some years since the Agricultural Department at Washington contained in their annual report an account of "Moule's Dry Earth System," of which Prof. Hilgard gave a *resumé* in your columns last year.

It simply consists in depositing a proper amount of dry pulverized earth into the privy everytime it is used. By this means human excreta are rendered innocuous and inoffensive. The privy may be kept as sweet as the parlor. Let public opinion force every man to adopt this system. Let every man worthy of the name at once clean out the cesspools attached to his premises, disinfect the night soil and have it hauled to the nearest farm. Then fill up the pit and introduce the dry-earth system. Finally, let him who neglects to take these measures understand that he is virtually as much an assassin as he who destroys his victim by the dagger or the bowl.

I have occasion to write strongly in this matter, having just lost a dearly-loved daughter by typhus fever, the miasma causing which entered her system from poisonous cesspools at a place and on a date which I could readily specify.

EDW. BERWICK.

Monterey, Cal.

## Drainage by Shrubbery.

Dr. S. P. Crawford writes to the Dixon, Solano county, *Tribune* some interesting statements concerning the value of trees and shrubs in the absorption of waters which otherwise would exhale miasma. We quote: "A free circulation of the water is the important desideratum in those places where it is confined beneath the surface. Plant trees and shrubbery of any growth whose roots run deep, in such localities, and those conditions will be broken up that develop malarial poison. It has long been known that the sun-flower (*Helianthus*) planted about places infected with malaria was a preventive of ague. Within the last few years the Australian gum (*Eucalyptus Globulus*) has been extensively planted in Florida and other Southern States to prevent malaria. It was supposed that the absorbing power of the former, and the neutralizing power of the aroma of the latter, rendered the poison inert. The true solution must be looked for, not in the absorbing or neutralizing power of the leaves, but in the roots.

The roots of these plants reach the water beneath, and ramify the soil with millions of capillary tubes which take up the water beneath, overcoming its inertia or stagnant condition, putting it in motion, by which it becomes pure, flows upward a living stream, to be thrown off by the leaves, taken up by the air and wafted away to some distant region to come down in the form of rain. It is estimated that a large forest tree will exhale or throw as much as eight barrels of water a day. If one tree can put in motion so much water, the quantity that each shrub, plant or blade of grass throws off must be immense. Plant grounds, then, not susceptible of drainage by pipes and ditches, and you have a system of drainage equal, if not better, than any other.

Surface water in pools, ponds or lakes, open to the sun and winds that agitate and evaporate it, do not cause disease, but, in fact, such conditions are often the sources of health, from the fact that such places absorb animalcule and deleterious gases from the air that arise from other sources. It is only on the margins of such bodies of water, where the banks are low and spongy, letting the water seep into them some distance from the main source, where it becomes confined, undergoes fermentation from the heat of the sun penetrating it, that disease is likely to arise. Planting trees and shrubbery in such localities, breaks up the conditions that give rise to poisonous emanations. The best system of drainage for our town, owing to its low condition, and there being no natural or artificial channels for waste water, is to plant shrubbery and trees in all places where waste water is thrown.

Advertising Rates.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	25	80	\$ 2.00	\$ 5.00
Half inch (1 square).	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.  
Subscription in Advance—Postage paid—one year, \$4;  
six months, \$2.25; three months, \$1.25. Remittances by  
registered letters or P. O. orders at our risk.

The ORIGINAL ARTICLES in this paper are mostly set in  
solid type, giving in our columns one-third more reading  
than is contained in ordinary leaded matter.

Address all letters to the firm, and not to individual  
members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:  
Saturday Morning, Oct. 13, 1877.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—Straw and Corn Cut-  
ting Machines; New Mining Districts; The Hayden Sur-  
veys; Hale & Norcross, 225. The Week; Making Lo-  
cations; Hydraulic Mining; Outside Districts, 232.  
Hydraulic Mining in California, 233. Patents and In-  
ventions; Notices of Recent Patents; Science in Amer-  
ica; The Savings Bank Failure, 236.

**ILLUSTRATIONS.**—Fig. 1, Dick's Straw and Corn  
Stalk Cutter and Splitter; Fig. 2, Perspective View of  
the Mechanism; Fig. 3, The Fly Wheel, 225. Sketch  
of Shaft No. 1—Malakoff—North Bloomfield Gravel  
Mining Co., 233.

**CORRESPONDENCE.**—Notes from the Moun-  
tain; Calaveras County Mines, 226.

**MECHANICAL PROGRESS.**—Marine Steam Boil-  
ers; American Skill in Silver Working; A Lubricating  
Pump, 227.

**SCIENTIFIC PROGRESS.**—Study of Earth Worms;  
Influence of Wine Bottles on Wine; Hisses and the Tel-  
ephone; Mars' Moons and the Nebular Hypothesis; Ar-  
tificial Color in Brandy; Social Insects, 227.

**MINING STOCK MARKET.**—Sales at the San  
Francisco, Pacific and California Stock Boards; Notices  
of Assessments, Meetings and Dividends; Review of the  
Stock Market for the Week, 228.

Sale—Excelsior Silver Mining Co.

## The Week.

The past week has been a somewhat eventful  
one in this city on account of the various fail-  
ures. The Pioneer Land and Loan Bank fail-  
ure, or swindle rather, has brought great dis-  
tress to a number of depositors, many of them  
losing their all. Neither Duncan or Le Warne  
have been caught as yet. The failure of the  
Fidelity Savings Bank, was unimportant, as it  
had only started up and had had no chance to  
get depositors. This bank succumbed under an  
attachment of \$500 for the counters. The fail-  
ure of Cross & Co., the large commission house,  
with liabilities at \$600,000 was a surprise to  
all, but the firm will probably resume business  
again shortly. The firm have been in active  
business for over 30 years, and have done a  
large business, especially in the export of grain  
and importation of various kinds of merchan-  
dise from Europe. They are largely interested  
in leading mining properties on the Pacific  
coast, being treasurers and managers of quite  
a number of leading California mines, notably,  
Black Bear, Plumas, Eureka and others. They  
are also the treasurers of the Leeds mining com-  
pany. They are also the agents of the London  
Assurance Corporation of London, England,  
and the Western Assurance Company of To-  
ronto, Canada. The business of these com-  
panies will not be affected in any manner by their  
failure. They have three establishments, one  
each in Glasgow, Valparaiso and San Francisco.  
Another item of interest this week is the prac-  
tical close of the Nez Perces war, General Miles  
having cornered Joseph and compelled him to  
surrender.

## Making Locations.

Too great care cannot be exercised by miners  
in making locations with respect to properly  
marking the boundaries of the claims. Simply  
driving a small stake a few inches into the  
ground and writing a notice on a card in an in-  
definite manner, is not the right way to take up  
a claim, even if it has always been the custom.  
The law insists that certain requirements must  
be complied with. In the inquiry into the reg-  
ularity of the proceedings prior to the applica-  
tion for a patent, the location notice is one of  
the first papers demanding the supervision of  
the department. The Secretary of the Interior,  
in the case of the Prince of Wales lode, took  
occasion to remark upon the latitude allowed in  
the construction of such notices, and said: "It  
should be borne in mind that the discovery of  
lodes and the preparation of location notices for  
the same, are generally made by unlettered men,  
and it would be productive of great hardship,  
and, perhaps, generally result in an entire loss  
of their valuable discoveries, if they were held  
to technical accuracy in their notices of loca-  
tion. Accordingly, it has been uniformly held  
by the courts and the department that extreme  
liberality should be shown to these notices, and  
if they were sufficiently certain to put an honest  
inquirer in the way of ascertaining where the  
lode was, that was sufficient." Accordingly,  
many location notices, neither very certain nor  
regular in form, have been held sufficient by the  
Department, especially in the absence of ad-  
verse claims; but the construction given to these  
informal notices was generally in cases of loca-  
tion prior to the passage of the mining acts of  
Congress. Since these acts, there are certain  
requirements which must be complied with.

The Revised Statutes require that the loca-  
tion shall be so distinctly marked on the ground  
that its boundaries may be readily traced. This  
is a very important matter, and locators cannot  
exercise too much care in defining their loca-  
tions at the outset, inasmuch as the law re-  
quires that all records of mining locations made  
subsequent to May 10th, 1872, shall contain the  
names of the locators, the date of the location,  
and such a description of the claim or claims  
located, by reference to some natural object or  
permanent monument, as will identify the  
claim.

The statutes provide that no lode claim shall  
be recorded until after the discovery of a vein  
or lode within the limits of the ground claimed.  
The object of the provision is to prevent the  
encumbering of the district records with useless  
locations before any work has been done. The  
claimant should, therefore, prior to recording his  
claim, unless the vein can be traced on the  
surface, sink a shaft or run a tunnel and find  
something definite before locating blindly on  
the supposition that there is a vein there. He  
should determine, if possible, the general course  
of such vein in either direction from the point  
of discovery, by which direction he will be  
governed in marking his surface boundaries,  
and should give the course and distance as  
nearly as practicable from the discovery shaft  
to some permanent well-known object or objects,  
such, for instance, as stone monuments, blazed  
trees, the confluence of streams, points of inter-  
section of well-known gulches, ravines or roads,  
prominent buttes, hills, etc., which may be in  
the immediate vicinity, and which will serve to  
perpetuate and fix the locus of the claim and  
render it susceptible of identification from the  
description thereof given in the records of the  
district.

In addition to the foregoing the claimant  
should state the names of the adjoining claims,  
or, if none adjoining, the relative positions of  
the nearest claims; should drive a post or erect  
a monument of stone at each corner of his sur-  
face ground, and at the point of discovery, or  
discovery shaft, should fix a monument, post,  
stake, or board, upon which should be desig-  
nated the name of the lode, name or names of  
locators, number of feet claimed and in which  
direction from the point of discovery; it being  
essential that the location notice filed for record,  
in addition to the foregoing information, should  
state whether the entire claim of 1500 feet is  
taken on one side of the point of discovery, or  
whether it is partly on one side and partly on the  
other side, and in the latter case how many  
feet are claimed on each side.

Within a reasonable time, say 20 days after  
the location is marked on the ground, notice  
thereof, accurately describing the claim, should  
be filed for record with the recorder of the  
district, who will thereupon issue the certificate  
of location.

The importance of attending to these details  
in the matter of location, labor and expendi-  
ture, will be more readily perceived when it is  
understood that a failure to give the subject  
proper attention may invalidate the claim.

CURLEY and Mack, two well known miners of  
Deadwood City, returned from the Big Horn  
country Friday night. They report passing a  
large party of prospectors, probably Wustum's,  
which went out from the hills under the guid-  
ance of a man whose name cannot be ascertained,  
but who was known as Charley. He claimed to  
have diggings in Rotten Grass that would yield  
30 cents to the pan. Arriving at that place he  
confessed to the falsity of his statement, where-  
upon the irate miners hanged him to a tree. It  
is presumed that he was in the employ of the  
post-trader, and took the party out for the  
benefit of that individual.

## Hydraulic Mining.

We commence this week the publication of an  
extended article on hydraulic mining in Cali-  
fornia, by Ang. J. Bowie, Jr., of this city. The  
paper was read at a recent meeting of the  
American Institute of Mining Engineers, and  
has been revised and corrected for the MINING  
AND SCIENTIFIC PRESS by the author. It is a  
general treatise on hydraulic mining, covering  
the ground in a very thorough manner. The  
paper takes specially into consideration the  
working of ground with very light grades, and  
some of the examples go to show the minimum  
grade at which hydraulic mining can be carried  
on. For the sake of comparison, the heavy  
grades of some of the northern mines are given.  
The paper shows also, what has not been dem-  
onstrated before, the quantity of water required  
to move different amounts of gravel at varying  
grades. In fact it gives information concerning  
all the details of hydraulic mining, treating of  
all the questions of dams, sluices, flumes, iron  
pipe, etc.

The statistical matter which is incorporated  
in the paper is of the greatest importance and  
utility to the engineer and miner. Some of the  
tables giving the details of work of different  
hydraulic claims are especially interesting.  
They show the duration of the runs over a  
period of several years, the amount of gravel  
washed, water used, grade of sluices, height of  
hauls, water pressure, average yield per cubic  
yard and per inch of water, average cost per  
cubic yard and per inch of water, total cost of  
melting and refining, labor, blocks and lumber,  
water, material, etc.; relative cost of labor,  
blocks and lumber, water, etc.; cubic yards of  
gravel moved per inch of water; amount of  
amalgam saved, fineness and value of gold and  
silver, total amount of bullion, and all the dif-  
ferent details in connection with the work. As  
these tables refer to different claims worked  
under different conditions, they serve as a valu-  
able basis for comparison. The claims referred  
to have been selected as furnishing examples to  
show the workings of hydraulic claims with  
small pressure and with minimum grades, so  
that the figures given are important as showing  
the least practicable grade at which this sort of  
mining can be carried on. With minimum fig-  
ures calculations can be made which are much  
more reliable than those based on the results  
with heavy grades. These latter therefore give  
a starting point for engineers to work from.  
They are from the best authorities, and show  
the result of practical work.

The paper also gives the results of experi-  
ments with the burdy-gurdy wheel at North  
Bloomfield, constructed by Hamilton Smith, Jr.  
It gives, moreover, some very interesting infor-  
mation, hitherto unpublished, concerning iron  
pipes, proper weight of iron, rivets, etc. Facts  
concerning the distribution of gold in under-  
currents and sluices are detailed, as well as the  
methods of blasting, arrangement of compound  
current for large blasts; methods of construc-  
tion of flumes, ditches, etc., effect of different  
classes of powder, proper size of nozzles for ef-  
fective work, and, in fact, everything which  
may be of interest to the miner or engineer in  
connection with hydraulic mining. The article  
contains numerous illustrations, and has been  
written with great care, forming the most com-  
plete and exhaustive treatise on the subject yet  
written.

We should advise our friends interested in  
this branch of mining to file away the MINING  
AND SCIENTIFIC PRESS containing this article,  
for future reference. There is nothing like it  
in any of the books on mining, and the infor-  
mation given can be gained nowhere else. Mr.  
Bowie's reputation as a mining engineer is suf-  
ficient guarantee of the reliability of all the  
statements made, and his practical experience  
in this State has given him opportunities for  
obtaining information open to few. The data  
collected will be of the greatest value to engi-  
neers and to the mining community, as being  
the result of practical work extending over a  
period of years.

**BIG BULLION SHIPMENT.**—The *Enterprise* of  
the 7th says: "The Consolidated Virginia and  
California mines made another shipment of  
bullion last evening, consisting of 156 bars, val-  
ued at \$637,865.39. Of these Consolidated Vir-  
ginia shipped 69, valued at \$274,431.91, making  
a total of \$1,102,144.28. The California shipped  
87 bars, valued at \$363,433.48, making, with  
the shipments previously made, a total for the  
month of \$1,534,616.27. Of this amount \$743,-  
545.46 is gold and \$791,070.81 silver. The  
total of the California for September exceeds  
that for August by \$130,000. The bonanza  
mines have shipped, during the past week,  
\$1,156,914.91."

**INDIANS IN ARIZONA.**—Some uneasiness is ex-  
perienced at the present time with regard to the  
emigration of about 300 Warm Spring Indians from  
the San Carlos reservation, and already a num-  
ber of settlers have been killed on the upper  
Gila. Whether these Indians will continue to  
depredate upon the settlers, and perhaps be  
joined by other discontented Indians, depends  
very much upon the action of the military  
authorities.

THEY are now working about 30 white men  
and 50 Chinamen at the river claim, near Chile  
bar, and are taking out all the way from \$400  
to \$800 per day.

## Outside Districts.

With all due deference to the wonderful out-  
put of precious metals by the Comstock lode,  
it may as well be remembered, by those desiring  
to invest in mining operations, that there are  
plenty of other localities where money can be  
made. Of those who deal in mining stocks in  
this city, nine out of ten will not look at any-  
thing off the Comstock. They think that the  
only place on the coast worthy of attention,  
and put up their money accordingly. Probably  
this feeling was caused more by the transactions  
in Idaho stocks than anything else. A few  
years ago the Comstock, Pioche and Idaho  
stocks were pretty much all there was to deal  
in in the city market. Pioche didn't pan out  
as well as it might, and the outrageous action  
of the managers of the Idaho stocks brought  
them into disrepute. A great deal of money  
was lost in the Idaho mines, not so much by  
reason of the lack of ore in the mines as by the  
lack of honesty in their managers. People who  
invested in them—and they were many—became  
disgusted and made up their minds not to go  
"outside," which means outside the Comstock.  
This feeling has grown with all the California  
street miners, and until lately it has been ex-  
tremely difficult to get a cent on an outside  
piece of mining property. Now, however, a  
better feeling prevails to some extent, but the  
old prejudices still exist among the majority.  
Those new to the business, who are likely to  
form their impressions from persons of sup-  
posed experience, will be apt to make a mistake  
if they think the Comstock the only place  
worthy of attention by mining men. It is per-  
fectly true that that camp is the most extensive  
on the coast; there are more mines there, and  
the bullion product is greater than all  
the rest of the camps combined. But it must  
also be remembered that more money has been  
spent there than in all the rest of the camps  
combined, the developments are more exten-  
sive, and the occurrence of such bonanzas ex-  
ceptional.

It is with no intention of attempting to de-  
tract from the merits of the Comstock that we  
take occasion to remind people that there are  
plenty of other places where mining property  
will be likely to pay as well as there. Persons  
desirous of buying mines have a wide and  
varied field from which to choose. California,  
Nevada, Arizona, Montana, Utah, Idaho and  
Oregon have numberless camps in which are  
numberless mines or claims only partially pros-  
pected. In many cases good prospects may be  
bought for small amounts, or interests bought  
in well-developed properties. It is by no means  
necessary to form a stock company in order to  
work a mine, for as a general thing mines  
owned and managed by individuals are the most  
successful.

We notice with pleasure that several old, or  
new mining districts of Nevada are coming to  
the front and beginning to attract attention. It  
is not well for the interests of the mining com-  
munity to be centered in one locality. The more  
prosperous camps there are, however small,  
the better it will be and the more chance there  
will be for working miners. In the big camps  
the chance of employment depends on a dozen  
mines or superintendents, but where there are  
a number of small mines the authority is scat-  
tered. In California quartz mining is perhaps  
more prosperous than it has been for several  
years and many of the old districts are looking  
up again. Prospecting is the order of the day  
in the mountains of this State, and under the  
new order of things—easier transportation,  
cheapness of provisions and more economical  
views—quartz mines which were worthless  
eight or ten years ago are now valuable prop-  
erties.

The same may be said to be the case in the  
Territories, so that the chances for investment  
is not by any means confined to narrow bound-  
aries. There are plenty of mines to be bought  
and plenty more to be found, so that those in-  
tending to invest need not feel themselves  
bound to look to the Comstock as the only  
place where fortunes can be made in mining.

**THE MARIPOSA COMPANY.**—The New York  
*Tribune*, of October 8th, says: "It is understood  
that F. B. Wallace is to institute proceedings  
against some of the Directors of the Mariposa  
Land and Mining Company for \$30,000, alleged  
to have been illegally assessed, and also against  
Eugene Kelly for \$1,000,000 damages. Wallace  
says that the statement is premature, and that  
the facts in the case will not be ready for pub-  
lication for several days. Kelly states that upon  
his return from St. Louis, a few days ago, he  
received a letter from Wallace and others,  
requesting payment of the claim without the  
annoyance of a suit, and that his response was  
that he would not pay another dollar, having  
already settled the matter on which the claim  
is based. He adds: "Since my connection with  
the Mariposa company in 1868, I have met with  
nothing but trouble and annoyance. That con-  
nection was brought about by a loan of \$100,-  
000 in cash, to secure the payment of which I  
took a mortgage. Gentlemen at present in  
opposition to this company have lately brought  
suit in San Francisco, and a receiver has been  
appointed. They have already sued me three  
times, and I have been successful in each in-  
stance. When the present threatened suit is  
brought and charges published, I shall be ready  
to say something on the matter."

## Hydraulic Mining in California.\*

(By ACO. J. BOWIE, JR., A. B., Mining Engineer.)

## Brief Outline of the General Topography of the Gold Regions of California.

The topographical features of California, as demonstrated by the explorations of the State Geological Survey, are found to be exceedingly simple. Three equidistant parallel lines can be used in conveying a general idea of the physical geography of central California.

A straight or "main axial line," whose course would be north 31° west, passing through the culminating peaks of the Sierras for a distance of 500 miles, can be assumed as the western boundary of the State. A second parallel drawn 55 miles west of the "main axial line" will skirt the western base of the Sierra Nevada, along the edge of the foot-hills. A third parallel run equidistant from the second will represent, "as nearly as possible, the western base of the Coast ranges." These parallels divide the State into three belts, namely, the Sierra, the great Valley of California, and the Coast ranges.

"This arrangement of the physical features holds good for a length of 400 miles in the direction of the main axial line, comprising almost the whole of the agricultural and the greater part of the mining districts."<sup>†</sup>

The section of the country which is of immediate interest to the miner is the western slope of the Sierras. These mountains, rising in a short distance from the Sacramento plains to elevations of over 7,000 feet, with occasional peaks 10,000 and 12,000 feet high, are cut by numerous deep and precipitous gorges or canyons, through which drains the immense watershed of the Sierras, supplying the main rivers of the State, and ultimately emptying into the Pacific ocean.

Between these canyons, ridges or divides are formed, on top of which gold placers are found. These gold-bearing surface-deposits extend from Shasta in the north to Kern county in the south, the most extensive deposits occurring in Plumas, Sierra, Placer and Nevada counties. The term *shallow placers* is applied to deposits of gravel and earth whose thickness varies from a few inches to five or six feet in depth, to distinguish them from *deep placers* or detrital accumulations found in ancient channels covering large areas, and varying from 100 to several hundred feet in depth.

## The Discovery of the Gravel Deposits Containing the Precious Metal.

The pioneer miner, after working out the river bars, followed up the stream to find "the source of the gold." Its existence was discovered from slides, denudations, and breaks in channels, which subsequent explorations proved to be the ancient river system of the State, whose general course is nearly at right angles to the present river system of California.

The indefatigable prospector, advancing further into the unexplored mountains, again discovered gravel beds at elevations of several thousand feet above the present water-level. The streams flowing through the precipitous canyons of the high Sierras aided materially in the development and discovery of the gold fields. Their waters were soon appropriated for gold washing, and thus was inaugurated the system of mining ditches, which to-day extends over several thousand miles.

The immense gold-bearing drift inclosed between channel walls, or "rim rock," as it is called, was explored by means of tunnels driven in from bordering canyons, tapping the bottom of the deposit, enabling the extraction of the pay stratum, which was subsequently sluiced to extract the gold. This style of mining received the name of "deep placer mining."<sup>‡</sup>

Little by little the "top dirt" of these deposits, composed chiefly of light soil, clay, fine gravel, and streaks of sand, was washed off, and in places considerable gold was thus obtained. Canvas hose was brought into use to convey the water over the banks for washing the dirt, and from this originated hydraulic mining. In the progress of the work strata were found composed of boulders, pebbles, quartz, sand, and various rocks cemented together, requiring the use of powder to break them up. The color of this cement was in places white or reddish, and sometimes blue.

Shafts sunk in these strata discovered the presence of gold in great abundance, and a fresh enthusiasm was thus infused into gravel mining, already on the wane, as the river bars were becoming exhausted.

## The Gold Bearing Deposits of California.

The auriferous deposits of California are chiefly confined to the western slope of the Sierra Nevada mountains. The principal counties in which placer mining is carried on are: Shasta, Trinity, Plumas, Sierra, portions of the east side of Butte and Yuba counties, also Nevada, Placer, El Dorado, Amador, Calaveras, Tuolumne, Mariposa, and Stanislaus counties. "It is here," says Professor Whitney, "that the belt of metamorphic slates and sandstones, which is peculiarly the gold bearing formation of the State, is developed to its greatest width, and least concealed from the miners' explorations by the

presence of overlying non-metalliferous formations. It is here that the physical conditions have most favored the concentration of the gold in the detrital formation, so that it could be obtained by simple washing, without the necessity of mining for it in the solid rock, and perhaps more readily and more abundantly than any region ever opened to seekers after the precious metal."<sup>§</sup>

The gold deposits are found in river channels, in basins and on flats, also as isolated rolling hills, and occur either as accumulations of gravel alone, resting directly on the surface, or as accumulations of detritus, consisting of gravel, sand, drift, pebbles, and boulders of all sizes covered with lava and other volcanic products. Their geological ages are Post-Tertiary and Tertiary. Quantities of fossil wood and numerous remains of land and water animals have been

Figures within the shaft indicate the number of colors to the pan, every test made from 120 feet down is here recorded.

## Sketch of Shaft No. 1—Malakoff—North Bloomfield Gravel Mining Company.

found in the deposits, and are being constantly unearthed as the mines are worked.

The auriferous alluvions mark the lines of ancient rivers, whose action on a grand scale was analogous to that which can be daily seen along the streams which receive the tailings from the hydraulic claims now being worked. Volcanic eruptions have in places covered these deposits with lava and tufa, hundreds of feet deep. Denudation and erosion, the companions of time, have subsequently played their parts, and later in turn the product of volcanic activity has been overlain with gold bearing detritus.

These gravel channels are from a few hundred to several thousand feet wide, and range from the shallow placer to a drift 600 or 700 feet in depth. Their richness in gold varies in general, as well as in particular, in the many parts of the State.

Ferruginous-colored spots, so well marked in "upper or top gravel," are not always as pro-

ductive in gold here as they are generally found to be in the gold alluvia of the Ural mountains. A black sand, composed chiefly of glancing grains of magnetic iron, generally accompanies the precious metal, though it does not indicate its presence.

Dr. T. Sterry Hunt, speaking of the erroneous impressions which prevail in reference to the presence of black sand in auriferous alluvions, very appropriately remarks that "smaller black sand residues, consisting chiefly of various ores of iron (sometimes oxide of tin and other minerals), may be obtained from the washing of almost all sands and gravels derived from crystalline rocks, and that the occurrence of a black sand, therefore, in no way indicates the presence of gold. When, however, this metal is present in a gravel, it, from its great weight, remains behind with the black sand and dense matters in the residue after washing."<sup>¶</sup>

## The Distribution of Gold in Gravel Deposits.

It is not unfrequently stated that it is from the washing of the entire hanks that the gold is to be expected, it being disseminated throughout the whole deposit. That deposits are or are not auriferous for their entire depth will not be discussed; but that gold is proportionately diffused throughout the detritus, so that it could all be considered as "pay," is denied by experience and facts, as proven in California and other parts of the world.<sup>†</sup> It is owing to that circumstance that miners have coined the expression "pay dirt," which means that stratum or those strata which contain the bulk of the precious metal.

In some districts gold is found 30 to 50 feet above the bedrock in sufficiently paying quantities to hydraulic, and in some shallow banks gold is quite generally disseminated. Both at San Juan and North Bloomfield the gold is more or less scattered throughout the deep drift, and diggings near Forest Hill, Placer county, 20 to 60 feet above the bedrock, have yielded profits.

The top gravel of the channel deposit which passes through Columbia hill, Nevada county, has, in several instances, been successfully washed. This is especially remarkable on account of the great depth of this deposit, which, from the explorations on Badger hill and Grizzly hill, is inferred to be 600 to 620 feet deep. With such facilities as would be afforded by a heavy grade, sufficient dump and cheap water deposits of this character consisting of a fine light quartz wash, containing no boulders nor pipe clay, though they contained an insignificant amount of gold per cubic yard, could be successfully worked by the hydraulic method.

Experience has proved, however, that the quantity of gold found in "top gravel" is insufficient to warrant any large investment based solely on its value. Under exceptional conditions and circumstances the upper strata have, in some cases, yielded handsome returns, but on the whole the general results have been anything but fortunate.

It is a well established fact that the pay dirt is obtained, not from the washings of the entire hank, but chiefly from that stratum, or those strata which are in most cases within eight or ten feet of the bedrock. Where this is of slate upturned on its edges, the gold frequently penetrates it one or two feet. It also occurs in thin streaks of cemented gravel scattered here and there in the alluvial deposits, and not unfrequently a fine lamina gold is found in the grass roots.<sup>‡</sup>

This last mentioned circumstance is in no way localized, as similar facts have been noted in other countries. Mawe calls attention to the existence of gold in the grass roots on Mount San Antonio, in Brazil, and Walsh states that gold was first discovered in the deposits between S. Jose and S. Joas, Brazil, by Paulistas, who,

‡‡ In reference to the occurrence of gold, the following note, taken from the *Engineering and Mining Journal*, February 10th, 1877, p. 34, relative to the discovery of pay gold in the New South Wales has been chiefly derived from interesting Mr. C. S. Wilkinson, F. R. S., writes from the Geological Survey Office, Gulong, under date of November 25th, to the Mining Department, as follows: "During my examination of the Tallawang gold-field reserve, I observed the important fact that the gold found in tertiary alluvial deposits at the old Tallawang and Clouch's hills diggings has been chiefly derived from conglomerates in the local measure. These conglomerates are associated with beds of sandstone and shales containing the fossil plant of our coal measures, the *Glossopetris*. This is the first time that gold has been noticed to occur in payable quantity in the coal measures in the colony, and it is not unworthy of remark that we here possess one of the most ancient 'alluvial' deposits in the world."

†† Mawe's *Travels*, p. 264.

pulling tufts of grass, "found numerous particles of gold entangled in the roots."<sup>§</sup>

The gold alluvia found near and along the banks of the Tuolumne river, Stanislaus county, present some striking examples of the distribution of the precious metal. The pay dirt in the Chesnau claim is confined to within six feet of the bedrock, whilst in the Sicard claim, situated about 600 feet south of it and across a ravine, with banks from 20 to 40 feet high, the gold is more generally disseminated as long as there are no sand strata, but whenever the latter appear the pay is confined to near the bedrock.

Sir Roderick Murchison, describing the gold alluvia of the rich mine of Pesbanka, near Bogoslofsh, says: "Most of the gold has been extracted near the center of the detrital mass, whose maximum thickness is about seven feet, and which is clearly divisible, as elsewhere, into two parts, viz.: overlying clay and shingle, and auriferous sand beneath."

At Minas Novas, in the Province of Minas Geraes, Brazil, the "greater part" of the gold is in a deposit called cascalho, which adjoins the decomposed bedrock. The cascalho is a conglomerate, composed of rounded quartz pebbles of various sizes, which have been cemented together with ferric oxide. "To this conglomerate the search for precious metals has been chiefly confined. Over this gravel lies a mass of red drift, varying in thickness from a few inches to 50 feet."<sup>¶</sup>

The stratum of cascalho mined from the bed of the river Jigitonhoua, at the Mandagao diamond works consisted of the same material as that of the other gold districts of Brazil. Large conglomerate masses of rounded pebbles cemented together by ferric oxide, found on the bank of this stream, occasionally contained gold and diamonds. The gold extracted from the cement gravel at Caparatra, situated higher up the river, was accompanied by a great abundance of "black oxide of iron."<sup>§</sup>

In the Patrickville Light claim, Stanislaus county, Cal., the pay stratum is six or seven feet thick and adjoins the bedrock. The gold is concentrated in this gravel deposit as long as there are sand strata in the hank, but with their disappearance it becomes diffused throughout the detritus. Whilst working this claim a large hole in the bedrock 25 feet deep was bottomed. The hole was filled with gravel, but no pay was obtained. The pay stratum was found to be on a level with and a continuation of the pay stratum of the rest of the claim. On the other hand, at the Chesnau and French Hill claims, whenever these hollows are found, a large yield of gold is invariably obtained.

The experience of miners in the gold fields of Victoria has led to the conclusion that "in large auriferous rivers gold is always found on the bars or point, and not in the deep pools or bends." In substantiation of these facts are cited Reid's creek, Wool Sheel, Twist's Fall, or Yackandandah, near Oshorne's Flat, and Rowdy Flat; at each of these places large holes were cleaned out, and "only a few colors obtained, whilst shallow flats immediately below them were very rich."

At French Hill, Stanislaus county, where the bedrock was undulating, and in depressions found around a little hill, formed by a sudden rise in the bedrock, the gravel paid better than in any other portion of the claim. The gold fields south of Miask\*\* in the Ural mountains, present a similar case, all the undulating ground and depressions around conical hills being the most productive in gold. The bulk of the pay dirt in the cement gravel of Nevada county is within the first 30 feet of the bottom.

It was the result obtained by the North Bloomfield gravel mining company from washing three and a quarter millions cubic yards of top gravel (1870-74), yielding 2.9 cents per cubic yard, and leaving a profit of only \$2,232.84, that determined capitalists interested in these claims to investigate the question of the comparative values of the upper and lower gravel deposits.

THE COLORADO BRIDGE.—The decision of the Cabinet concerning the controversy between the Texas-Pacific and Southern-Pacific railways, as to the latter's bridge and road over the Colorado reservation, and is a manifest victory for the Central Pacific. It was based upon an argument that, although Congress alone has power to grant the right of way over public lands, yet it is neither the duty nor interest of military or civil power to interfere to preserve any improved means of access to a military reservation. The practical effect of the decision will be to give the California Company free permission indefinitely to run its trains over the bridge and across the reservation, as Congress is not at all likely to interfere.

TUSCARORA.—The Western Union Telegraph Company has completed its line to Tuscarora, Nev., making the distance from Elko by wire 44 miles. The distance by stage is 48 miles.

ARIZONA was visited by heavy showers of rain during the last of September.

‡ Deep placer mining is now carried on in those sections of the State where the rich deposits are covered with thick beds of lava, rendering hydraulic mining impracticable.

## The Big Bonanza.

The workings on the bonanza mines are on so extended a scale and of so intricate a nature that it is very questionable whether any one not particularly interested in the mines and the drifts, cross-cuts and winzes run and in the extent and development of the various stopes, can carry them all along from week to week and comprehend.

### The Important Developments

Which have been and are now being made. There are few, therefore, who know the reach of the ore bodies being opened up on the various levels or how far they have been traced. To do this would, indeed, require the reader to follow the work through a labyrinth of channels and to retain a vast amount of statistics, important, yet not readily remembered. It was with a view of making a summary of these statistics, in connection with the developments made, that the *Virginia Enterprise* reporter asked and obtained the permission of Col. Fair to make a descent into the mines and take a look at the work going on and the formations encountered. It was not expected, however, that all the levels of both mines could be visited and examined in a single day; besides, the space required to chronicle the whole would exceed the limits of a single issue.

**The 1650-Foot Level of the Con. Virginia.** Was the first portion of the big bonanza visited. The *Enterprise* says: The drop was made through the C. & C. shaft and the visit made under the guidance of W. H. Patton, Assistant Superintendent. The drift west was followed to its face. The developments from what was formerly considered the west wall of the ore body are important. After cutting through eight feet of porphyry a new and unexpected ore body was encountered. Then came 35 feet of ore and the drift penetrated porphyry again. This, however, continued from five to eight feet, when ore was again encountered. This is

### A Most Important Development.

And one which is becoming more so with every foot made in the ore body by the drift. Nor are the developments being made by the stopes, as they are being extended to the south on this level of much less interest. They have been extended 120 feet in what is known as the west ore body—i. e., west of the horse—and the ore is found to be widening gradually all the way. When first opened up this ore body was 42 feet wide; yesterday (the 30th ultimo) the stopes were about 50 feet in width. The importance to be attached to this development will be apparent when it is remembered that this ore body on the level above extended 200 feet further south than where the stopes on this level now are. These are what are mentioned as the west stopes, 1650-foot level.

### The East Stopes

On this level are also following the ore body south, and on the east side of the horse. They have been extended about the same distance as the west stopes, viz.: 120 feet, and are also widening and extending as they reach out in that direction. In other words, the horse which lies between the two ore bodies is gradually becoming narrower. Where cut through by the drift west on this level it was 32 feet in thickness. The ore bodies have widened out till, at the southern extremities of the stopes above mentioned, they are within 12 feet of each other. In other words, the horse has narrowed down 20 feet in a distance of 120 feet, and is at the point above mentioned but 12 feet wide. At this rate it will entirely disappear about 200 feet from the line of the drift.

### Into the California.

The distance from the drift on the 1650-foot level to the California line is about 30 feet, and the next point visited was the west stopes of the California mine on that level. The sill floors of the stopes are being extended northerly. They have been carried north of the line about 30 feet, and are there 42 feet in width, and the west wall of the ore body at that point has not yet been reached. A cross-cut (No. 2 west) has been started westerly from the lateral drift, and will be continued on in the same manner as the one in the Consolidated Virginia, to explore the ore body recently encountered as above, and which will certainly be found in the California, since the developments in the Consolidated Virginia are but about 30 feet south from the line between the two mines.

### The Ore

Opened up on this level is exceedingly rich and the extent of the ore bodies immense. For the purpose of opening them up a drift has been extended north through the horse, leaving the ore untouched on both sides. This was followed to where the branch drift from the C. & C. shaft intersects it, at the northern end of the horse, a distance of some 200 feet. At this point cross-cut No. 3 has been started west and is in ore 10 feet. Again the drift was followed north, and for a distance of 100 feet, to where cross-cut No. 4 has been run about 60 feet, and this is also all in fine ore, and the quality of that near the face was improving upon even the excellent deposit opened up nearer the lateral drift. These

Cross-cuts are all Penetrating Virgin Ground. And, as will be seen from the distances apart, are opening up a body of ore immense in extent and exceedingly rich in quality. And all this is in the west ore body on a single level, and yet there are those who talk of the California as an exhausted mine and hint of "no more dividends." These developments, and a look at the ore, make it still more mysterious why the stock of this

mine should be rated after that of Consolidated Virginia.

### An Eastern Ore Body

Is also opening up on this level most wonderfully. The first place visited was winze No. 3, which is being sunk in the ore body at the northern terminus of the horse, and is down 50 feet or such a matter, all the way in ore of a good quality. Here a hoisting engine has been placed to facilitate the work of sinking. This ore body is reaching off north and east to an unknown distance. The boundary of the bonanza as traced on the 1500 level was north, 54 degrees east, and the clay wall of the body here seems to have a very similar trend. What it may portend, and how far extend, remains to be seen.

### The 1600 Level

Was reached by the cage in the winze and again explorations began. Here the make of the ore body to the northeast has been more extensively traced by a drift following the clay. This drift has penetrated about 85 feet and is in ore all the way. This ore body gives every indication, however, as traced up, of uniting with the western ore body at some point further north. We then returned to No. 3 winze and examined the west ore body on this level. The ore body has been traced going northerly for some 400 feet and stopes are being raised at each end. The ore is very rich and exists in immense quantities. It is similar in kind to that below, and is

### Very Rich.

Being of that loose, soft, porous nature which is easily reduced and which crumbles to pieces when exposed to the air for any length of time. It has been followed by the stopes on this level east and west 120 feet, but not to its limit. It is no doubt the same ore body found above; but on this level an important fact is being rapidly ascertained, and that is that it makes further west and east than on the level above. How far it may extend is not known, as its limits have not been sufficiently traced to determine it.

### The Ore Body is Undefined

As yet, its extent not having been reached in either direction. It, however, at the northern end makes to the east, and will doubtless find a connection with the east ore body as it widens out on the 1650 level. On this level connection has been made with the Ophir shaft and the ventilation is perfect, as it is, in fact, all through the mine. From this point the connections were followed to No. 3 winze, the descent to the 1650 level made, and thence the C. & C. shaft sought through the north branch drift.

### Improvements at the C. & C. Shaft.

The double deckers are being successfully run at the C. & C. shaft, and by a single drop four cages of ore are loaded, hoisted and trundled off. The new English cable, of which mention was recently made, is in place and swings the cages with perfect safety.

The dressing rooms recently fitted up there are the finest on the lode. They are large and airy and conveniently furnished. The north one is fitted up for ladies and with all the needed appliances, including bath tub and hot and cold water. Between this and the office is the gents' room, similarly arranged and furnished, and has the additional advantage of the finest shower bath apartment, with hot and cold water, which there is on the Comstock.

A new changing room for the workmen has been fitted up under the carpenter's shop south of the shaft. The room is 60 by 60 and lighted by four large east windows. All around the room are places for hanging garments, with hooks attached, and across the room are six similar rows, and several others nearer the stove running part of the way across. In the center of the east side is a cylindrical stove, made like a steam boiler, which is six feet long and three feet across. To guard against fire, boiler iron has been put on the floor, covering a space 10 by 12 feet. A shower bath to occupy one corner is not yet in. There runs along the south side a large tank for washing clothes. The whole is capitally arranged and will be found most convenient.—*Enterprise*.

### Vigorous Prospecting.

The Pliocene company, on Galloway hill, says the *Mountain Messenger*, means business, and has started to prospect its ground in a manner worthy of emulation by all companies that are able. This company, under the management of Mr. Thurston, Supt., commenced boring for gravel in the early part of this summer by hand power. A six-inch hole was put down through hard lava boulders to a depth of 186 feet, when pipe clay was encountered. Up to this point it was found necessary to use the drill exclusively. Here the auger replaced the drill, and the bore was extended downwards through 54 feet of pipe clay. When this depth was reached it was found difficult to make much headway owing to the falling in of pieces of clay from the sides of the hole, and requiring nearly all the time to keep the shaft clear. Upon consultation and a report from the Superintendent it was decided to abandon further attempts to reach bedrock with the auger, and commence a shaft. The company has gone about this work in a manner that commands admiration. It has a 90-horse power engine on the way, and boilers capable of generating steam in excess of its requirements. A large boarding house, engine house and timber shed will be erected as soon as possible. A contract has been let for 500 cords of wood. The shaft has been commenced and will be about 6 by 13 in the clear, with three

compartments. (We are not sure that we are correct in regard to dimensions.) It will be timbered with 8 by 8, sawed stuff, which will certainly make a very fine and substantial curbing. About 50 feet of the shaft can be sunk without encountering water, and by the time this is completed it is expected that the steam hoisting and pumping machinery will be in place. If the winter storms will hold off long enough to enable them to get under cover, work will go steadily on through the winter. It is supposed that the shaft will be from 400 to 450 feet in depth, but this is approximation, in a great measure. We are glad to see mining capitalists turning their attention to our mines, for we feel certain that in no part of the State is there such an inviting field for investment.

### A New Quicksilver Saver.

An experiment is being tried, or rather is about to be tried, at the head of the blanket sluices of the Con. Virginia pan mill and near the C. & C. shaft, with a new machine for saving quicksilver and catching the valuable part of tailings. It consists of a modification of the old California shaking tables. The preparations for trying the process are on a small scale. A water wheel is being erected some four feet across. This is to turn two shakers which are each fitted up with eight small copper pans coated with quicksilver, and containing in each of their bottoms cast iron balls about as big as rifle bullets, which are also quicksilver-coated. In some of the pans these bullets are still united as cast, the string of them being long enough to reach across the bottoms of these pans. The water wheel is the motive power, bands running therefrom to small pulleys on each of the system of shakers with their eight pans. The water is taken from the flume above at a point where it raises over the C. & C. side track, as is also the silt for the experiment. While the former turns the wheel and shakes the pan, it also helps to carry the latter down into the pans, which are arranged in perpendicular rows of four each. The agitation over the quicksilver surfaces of the balls and the pans, as the tailings pass through from pan to pan, serves to collect the particles of quicksilver as well as to amalgamate the mineral which is contained therein, and the valuable portion is thus collected and saved.

The "institution" is under the patronage of Dr. Cachot, of San Francisco, who is on hand to try the experiment. The "baby machine" will doubtless work tolerably well, but it seems as if there must be some wear and tear to a big one of the kind, and a big machine will be needed here if any.—*Virginia Enterprise*.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

### BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

**Raising of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver.** 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, appliances and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

**Map of California and Nevada;** The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

**Instructions of the U. S. Land Commissioners.**—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emptions; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

**Abstract from the U. S. Statutes.**—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys. Price, for Pamphlet, List of California Post Offices. List, post paid, 60 cts.

Published and sold by DEWEY & CO., S. F.

## PACIFIC RURAL PRESS,

A first-class 10-page Illustrated Agricultural Weekly, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Send for a sample copy.

## DEWEY & CO.

### American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

**PATENTS** obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

### Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

### Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

### Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## FRED'K OGDEN, Sole Owner Tulloch Patent,

ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, September 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery; there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a machine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Stripe Mill; they were thrown out after a fair trial of some two weeks.

CAUTION  
TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

HENRY C. PERKINS,

North Bloomfield Nevada County, Cal.

## San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLAT CUT and SLIT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

PATENT, LAW A SPECIALTY.

Office—202 Sansome Street, N. E. corner Pine Street,  
 San Francisco.

(Continued from page 229.)

All the water has been pumped out and the men are busy sinking on the ledge. Reports from the Doyle say that everything is looking well. Dan McCasker is down 60 feet on the ledge, and is taking out ore which he claims will assay up in the thousands. We learn that the purchasers of the Tip-top mine are intending to levy an assessment of \$100,000, with which to develop their property. The new gold mill at Walnut grove has been completed by Mr. Hoefler, and is now running on ore from the various leads in the neighborhood. Frederick's mill is again running. P. A. Craigue is in town from the Bradshaw country. Mr. Craigue reports that the water has been entirely taken out of the Tiger mine, and the main shaft is now in 12 feet of good ore and no wall found yet. There are now 15 men at work on the original location of the Tiger mine. The Eastern parties for whom P. A. Craigue bonded the great Sexton mine, in Weaver district, have concluded to buy the mine and at once erect a 20-stamp mill. The Black Warrior mine is improving in richness and size as the work progresses. The Goodwin is now down over 150 feet, and the ore richer and in larger quantities than ever. Negotiations are pending for the purchase of the California mine on the Tiger lode. From Greenwood, we hear that things are very lively and that the Signal mill will start in two or three days.

**BLACK WARRIOR.**—*Arizona Miner*, Sept. 23: The original locators of the Black Warrior mine have entered into a contract with N. Ellis and associates to prospect this mammoth lead, until \$10,000 shall have been expended, when should they be satisfied with the mine, they have the privilege of paying \$20,000 more and receive a deed to one-half of the same. The Tip-top company have disposed of their mine, in Humboldt district, to Hoffman, Gillett & DeGrano, for \$50,000 cash, and, as these gentlemen are all mining experts, it is generally supposed that they knew what they were purchasing.

The Peck company are still working their well-defined and prospected bonanza and are now shipping over \$50,000 per month, giving employment to over 150 persons. Their new mill will soon be erected at the mine.

The Tiger, in Bradshaw, is undergoing a thorough test through the skill and management of Mr. Helm, who is obligated with the owners to expend, in prospecting this old favorite lead, \$10,000, when, should everything prove satisfactory, a purchase will undoubtedly be made. In Turkey creek, Matterson & Co. are prospecting their various leads with energy and great faith, grading roads and excavating a site for their new mill, which will soon arrive on the ground.

Near Walnut grove, Mr. Hoefler has just completed his new gold mill, which is running steadily on ore from the numerous leads in that vicinity.

Fredericks has once more started up his Senator mill, with new and improved machinery, having hundreds of tons of good ore on the dump, and we expect to hear of financial success from that quarter.

The Black Warrior, Tip-top, Cross-out, Peck, Tiger, Turkey Creek, Walnut Grove, Senator and other mines and enterprises, such as building the road to Bradshaw and our new county buildings, wherein nearly \$100,000 is to be expended. All have a tendency to make money easy.

## Idaho.

**MINING NOTES.**—*Owyhee Avalanche*, Oct. 6: Report from the various mining districts of the Territory have been gradually improving during the past few weeks, and the indications are that the coming winter will witness a much greater degree of prosperity than that which marked the progress of operations last winter. In this immediate vicinity the outlook has greatly improved since the beginning of the fall months, and the change seems to be based on real, substantial progress. As an evidence of this it gives us pleasure to state that the shipments of bullion from this camp within the past four weeks have amounted to within a trifle of \$40,000; not an immense sum it is true, and a very small proportion of what it would be if our incorporated mines were all in full blast. It shows, however, a decided improvement in business, and it looks now as if it would grow better from this time forward.

At the Golden Chariot the work of sinking is progressing favorably. Work is now going on at a considerable depth below the 14th level.

At the Empire some inconvenience has been experienced from a flow of water near the 8th level. All the indications point to the existence of an immense bonanza in that direction.

We are gratified at being able to state that the outlook for the Poorman is quite favorable.

THERE are upwards of 20 men at work on the Black Jack mine, Florida mountain, and from seven to ten tons of rock are being daily taken out.

A CRUSHING of 35 tons of Illinois Central rock yielded a bar valued at over \$14,000.

## Oregon.

**THOSE SOAP HOLES.**—*Willamette Farmer*, Oct. 6: Parties just over from Primeville inform us that the people there have now more confidence in the "soap holes" than ever before. The companies owning the machinery which was lately taken over there, lost confidence in the man that was superintending their work and discharged him. Prof. Hurley has been put in charge of the mill and is getting everything ready for a run. A ditch is being constructed to carry water to the mill from Camp creek for the purpose of washing away the tailings. As soon as it is completed, and some other minor improvements made, the mill will be started up.

**COAL.**—*Oregonian*, Oct. 6: At Henryville mine, Coos bay, there is a block of coal eight feet long, two feet wide and two feet thick.

It is said that the workmen of the Tellurium mine in Douglas have struck \$1,500 rock.

**WATER WANTED.**—*Jacksonville Times*, Oct. 6: The richest ground in Jackson county will never be washed until 15,000 or 20,000 inches of water are brought on the divide between Bear Creek valley and Applegate. It can be done, and more money than it would take to do it has been expended in much less certain enterprises in California and Baker county, Oregon.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Northern Belle, Oct. 3d, \$9,436.04; Arizona, 3d, \$1,104; Endowment, 6th, \$2,502; Arizona, 7th, \$895.54; Alps, 3d, \$5,924; Northern Belle, 4th, \$6,618; California, 6th, \$363,433—total for September, \$1,534,516; Con. Virginia, 6th, \$274,431—total to date, \$1,102,144; Leopard, 9th, \$3,300.

**THE Calaveras Chronicle** of October 6th says: Several miners' cabins were destroyed by fire at the Gwin mine, at Mokelumne Hill, last Monday night. The fire originated in the cabin occupied by Newman and Haupt, totally destroying the building and its contents, the boys being at work in the mine at the time. The flames were communicated to a number of other cabins, which were hurried.

**THE President** of the Pennsylvania coal company and the Delaware and Hudson coal company, and the General Agent of the Delaware and Lackawanna company, have had a conference with their striking miners. The miners receded from their demands of 25% advance, but the officers declined any negotiations pending the strike.

## PATENTS AND INVENTIONS.

### List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch from Washington, D. C.

WEEK ENDING SEPTEMBER 18TH, 1874.

**HORSE-POWERS.**—Thomas C. Churchman, Sacramento, Cal.

**WHEEL PLOWS.**—Stephen M. Harris, Forest Grove, Oregon.

**CARPET SEWING MACHINES.**—Joseph Hess, S. F.

**PNEUMATIC DREDGING TUBES.**—William P. Lewis, Oroville, Cal.

**ENDLESS ROPE TRACTION RAILWAYS.**—Asa E. Hovey, S. F.

**BOOTS AND SHOES.**—George Steinhilber, S. F.

RE-ISSUES.

**RELIEF VALVES FOR WATER CYLINDERS.**—Charles E. Blake, S. F.

**FIRE ALARM TELEGRAPH REGISTERS.**—Daniel F. Phelps and Charles W. Edmunds, S. F.

WEEK ENDING SEPTEMBER 27TH, 1877.

**GANG PLOWS.**—Daniel Funk, Harrisburg, Oregon.

**GRAINING DEVICES FOR TRACTION CARRIAGES FOR PROPPELLING CARS AND VEHICLES.**—Charles A. Gustafson, S. F.

**ENDLESS ROPE TRACTION RAILWAYS.**—Andrew S. Hallidie.

**SOFA BEDSTEADS.**—August Hansen, S. F.

**PACKING CIGARS.**—John W. Shaeffer, S. F.

**KITCHEN TABLES.**—Leon M. Bowdoin, Nevada City, Cal.

**SAW MILL SET WORKS.**—James A. Robb, S. F.

**HORSE COLLARS.**—Adam Rutherford, Walla Walla, W. T.

**COIN WRAPPERS.**—Roger L. Ryan, S. F.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

**NOTE.**—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**PROJECTILE FOR CANNONS.**—Joseph R. N. Owen, Hamilton, White Pine county, Nev. This is an elongated projectile for smooth-bore cannon, and is designated the "Feather Bolt" shot or shell. The improvement is in the construction of the projectile itself, by which is secured an accurate and steady flight throughout its range, when fired from smooth-bore guns; and the certain maintenance of its long axis in a position tangential to the line of trajectory at all points of its flight, without the usual spinning motion of a rifle projectile. It relates also to certain fittings essential in adapting the shot to the conditions and requirements to which it is subjected within the bore of the gun, and while being driven by the expanding powder gases, but which are stripped from it when beyond the influence of the latter. The projectile may be made solid or hollow, and should be made of the best oil-tempered steel. Upon the basis of an assumption which contravenes the generally accepted theory upon the subject, but which is, the inventor claims, nevertheless, positively sustained by experiment, and by many well-known facts, that the powder gases continue to exert a very important influence upon the projectile even for some distance beyond the muzzle of the gun, in determining its velocity and range. The "Feather Bolt" is provided with a strong metallic shoe or sabot made of tough wrought iron. This is a thick, circular disk with a counter-sink in the center to receive the point of the shot. It is claimed that this projectile will deliver its blow end on and in the line of trajectory, whether fired at high or low elevation, or at long or short range. This would remove all objections to the use of the much desired percussion fuse.

**METHOD OF PACKING CIGARS.**—J. W. Shaeffer, S. F. This invention relates to a novel method of packing cigars in boxes, so that the cigars are preserved in better condition than when packed in the ordinary manner and the box is more compact and symmetrical. In the ordinary method of packing cigars they soon become very dry, and especially so at the finished tips, so that when the smoker bites this off the wrappers are apt to become broken, so that it will not draw well, and the user is annoyed by fine particles of tobacco coming off. In this method the box is made long enough to receive two cigars in length when their ends slightly overlap. The cigars are made into two bundles of 25 each, and these are placed with their ends meeting, which holds them in place and keeps the ends from drying.

**ANKLE BOOTS.**—Geo. C. Steinhilber, S. F. This invention relates to a novel construction for hoots and shoes, which is called a folding ankle hoot. It consists in forming the portion which surrounds the ankle in one piece, and of sufficient width to allow easy ingress or egress for the foot. This ankle piece has folds upon each side, so that when the boot is on the foot it may be drawn close against the ankle, and secured by a single strap and buckle at the rear. This forms a neat and expeditious method of securing ankle boots without the use of any buttons, strings or other fastening except a single strap, and without making any openings in the sides or front.

**WOOD GRAINING MACHINE.**—Wm. O'Day, S. F. The invention relates to an improved machine for graining boards which have been planed and painted, or otherwise prepared for graining in the lough piece. A graining roller and impression roller are mounted on a suitable frame. The graining roller is made frequently of metal, upon which the desired graining pattern is engraved or otherwise delineated; the impression roller possesses a soft, elastic surface like the roller of a printing press. These rollers are mounted horizontally across the frame so that their faces are pressed slightly together. The lower part of the graining machine rotates in a tray of paint, so that it continually supplies itself with paint. A flexible scraper is mounted at an angle to the outside face of the graining roller so as to press against it. As the inked surface leaves the tray it is scraped to allow the surplus paint to run back to the tray, leaving the pattern filled. It then rolls in contact with the yielding surface of the impression roller, which takes the paint from the graining roller and imprints it on the board which is passed under it in contact with its lower side. Suitable gearing is provided for feeding the boards to the rollers. By means of this machine boards may be grained with great celerity, as it is only necessary to run them beneath the rollers while the machine is in operation. A number of rollers with different graining patterns engraved on them, can be kept on hand so that a variety of work can be done.

**GRIPPER.**—Chas. A. Gustafson, S. F. The invention is an improved gripping device for connecting a car or other vehicle with an endless moving rope or cable which is arranged to travel in an underground tube or tunnel for propelling the car or vehicle along a track or roadway. The improved gripper can either to operate by a lever or screw, and it consists of a permanent jaw which forms a part of the framework of the gripper and two movable lever jaws, which are operated by a vertically moving slide and the lever or screw referred to. Pulleys are provided for sustaining the moving rope when the permanent jaws release it.

**WATER CLOSET.**—John R. Adams, Oakland. The patent covers certain improvements in water closets and consists mainly in a novel method of banging and operating the pans so that the inventor does away with the space usually needed for the operation of the pan, and makes the apparatus more compact. It also relates to a method for leading all waste water from leakage into the pan. The operating devices are also simplified.

**SOFA AND BEDSTEAD.**—August Hansen, S. F. This is a novel construction of sofa beds. It consists in so constructing a sofa that it may be opened out to form a complete bed of which the back of the sofa forms the head-board. The details would be difficult to describe without a lettered engraving.

### Science in America.

As a general thing work partaking of a scientific nature is better appreciated abroad than it is by the public at home, and our scientists look to recognition from foreign countries before they begin to expect it from their own countrymen. The reason probably is that in the older countries they appreciate better the value of the results of scientific research than is done here, although we are happy to say that this is being rapidly remedied in the United States, and more interest is now felt in scientific matters than formerly.

We are here a very busy people. The country is young, and most of the population are hard at work trying to make their fortunes. Property is not handed down from father to son, as is so generally done in the older countries, so that when the young man comes of age he has a ready made fortune to step into; but each one, as he grows to maturity, must start in and carve his own way. Accordingly there is less opportunity for men to devote their lives to scientific pursuits than there is where they have plenty of time and money.

Again, in the older countries there are museums, and collections and schools especially to aid scientific students in their work, and almost every little town has its association or academy, where scientific subjects are discussed. Here such things are confined entirely to the larger cities, and the public educational funds are devoted mainly to the support of the public schools. The consequence is that in Europe there are many more persons interested in scientific pursuits than among us.

A love for science, however, is now more noticeable among the masses than formerly, as is also an appreciation of scientific work. In our colleges and advanced schools the scientific course is more sought for than it was. In the commoner walks of life there is more need for accurate knowledge than there used to be, and skill in almost any branch depends, to a great extent, on acquaintance with the scientific principles involved in the work. Accordingly, men know that to be successful they must not only be familiar with what is to be done, but know the reasons therefor.

In the United States there are very many

journals devoted to scientific matters, which are doing much to educate the masses to an appreciation of the value of scientific knowledge. The MINING AND SCIENTIFIC PRESS is proud to be one of these, and to have done its share in the good work on this coast. The public are learning to appreciate the fact that the application of scientific discoveries to the wants of everyday life have been productive of much good, and that science is not, as used to be supposed, simply the art of discovering and naming new insects, shells, flowers or minerals, but is something of practical utility, attaining results which are applied for the benefit of mankind generally.

### The Savings Bank Failure.

The failure of the Pioneer Land and Loan Bank of Savings, which occurred this week, is another illustration of the fallacy of entrusting money to the care of corporations which offer higher rates of interest than are current. The trouble is that poor people naturally want to get as high a rate, as possible for their savings, and handsome buildings and offices, polite officials and high rates of interest attract them irresistibly. The consequence is a large number of depositors with a few thousands each, go to such places and give the managers opportunities for their being not available in any other way.

Duncan, the manager of this bank, seems to have had the entire management and control. The President was a figure head, and confesses he had no power whatever and knew nothing of the business. Le Warne, the son-in-law of Duncan, was Secretary of the Safe Deposit Company. He "raised" the certificates of stock of this company and Duncan disposed of them. Besides the thieves in this direction, the losses of depositors are estimated at \$1,000,000. Duncan and Le Warne have disappeared with their ill-gotten gains, and as yet no trace of them has been found. The Fidelity Savings Bank, which depended to some extent on the Pioneer, had only been running 10 days, and was closed by an attachment for \$500 on the furniture, but it had nothing to lose, and the failure shows on what a flimsy basis such institutions may be founded.

The difficulty of such failures or swindles is, that they cause not only distress to those immediately concerned, but loss of confidence in all such institutions. The depositors have no protection whatever against the dishonesty of the officers. Money is put into such institutions in the care of men personally unknown to the depositor, and implicit confidence must be placed in their honesty. It looks as if our financiers might devise some plan for the better protection of depositors in savings banks, so that these failures should not occur so often. Of course there are sound banks and honest officials, and it is to the credit of the other banks in the city to know that none of them have had any dealings with the Pioneer for some time, as their managers were confident that the high rate of interest paid was not compatible with honest management. Altogether the affair is a very unfortunate one, and throws discredit on the city.

**COMSTOCK PAY-ROLL.**—For the month of September the principal mines on the Comstock paid out the following amounts to the miners: Sierra Nevada, \$11,800; Ophir, \$14,842.50; Mexican, \$2,556; Union Con., \$1,522; Savage, \$12,221.88; Hale & Norcross, \$6,469.25; Chollar-Potosi, \$10,254.50; Chollar-Savage-Norcross shaft, \$7,011.25; Overman, \$10,112.25; Caledonia, \$6,450; Crown Point, \$9,546; Yellow Jacket, new works, \$13,886.25; Yellow Jacket, old works, \$6,106; Belcher, \$12,198; Belcher-Crown Point air shaft, \$5,622.50; Con. Virginia, California and C. & C. shaft, \$141,871.25.

**THE ore dumps** at the Jackson, just finished, received their first load of ore yesterday morning, says the *Eureka Sentinel* of October 3d, and it is calculated that they will be filled by Thursday next, when shipping to the Richmond furnaces will begin. Smelting operations will commence Saturday morning, and the Jackson mine will wheel into rank as a bullion producer.

**THE South Comstock** company have steamed up again after having been shut down for some months. Their main shaft is 500 feet in depth. When they shut down there was 30 feet of water in the shaft; now it is found to be perfectly dry. The South Comstock is situated just south of the Silver Hill, the deep shaft of which has not only drained it but has also drained most of the other small shafts in that vicinity.

**THE Stonewall Jackson** mine in Arizona, recently sold to capitalists in this city, brought \$120,000 cash. This was about six weeks since, and the new miners have, it is said, taken out enough already to reimburse them, while sinking the shaft. The vein is only from four to six inches thick, but is very rich.

**ALL obstructive** regulations will be waived and American articles admitted to the French exposition on the simple introduction of our Minister Plenipotentiary. Legislation by Congress is, therefore, unnecessary.

**WOODWARD'S GARDENS** has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

Mechanics' Institute Awards.

The following additional awards have been made by the Committees of the Twelfth Industrial Exhibition since our list was published:

CLASS 42.—Samuel Kellett, plaster ornaments; M. Doyle, bust; Thos. Gagliardi, display of plaster busts; J. Grunzel, display of amber work; L. Schumann, display of meerschaum work.

CLASS 37.—Guido Kustel, galvanizing of animal and vegetable products.

CLASS 13.—W. Renuie, Boynton's tile parlor stoves; St. Louis Stamping Company, exhibited by J. B. Stotson, display of granite ware.

CLASS 15.—Jost & Vanlaere, mantels and California onyx; W. C. Campbell, Scotch granite monument.

CLASS 32.—J. Horzog & Co., Eureka hair.

CLASS 33.—Alexander Mackay, cocoa matting; California Silk Manufacturing Company, sewing silk and twist.

CLASS 35.—Miss K. L. Cole, paper patterns.

CLASS 25.—Rutherford & Mitchell, automatic reachers.

CLASS 21.—Kohler, Chase & Co., display of wind instruments; Paillard & Co., display of musical boxes; W. R. West, banjo of California manufacture.

CLASS 34.—J. Detrick & Co., best tents; W. H. Burton, best awnings; Mrs. W. H. Burton, awnings for bird cages.

CLASS 23.—E. Hook & Co., kitchen table; H. Huickelthier, portable reading desk; California Spring Bed and Mattress Company, Crandall spring bed (awarded Sept. 19th).

CLASS 9.—Hall & Kelshaw, metallic boat; San Francisco Yacht Club, display of yacht and ship models.

CLASS 12.—S. F. Forge Co., forged and finished axles.

CLASS 22.—B. Graves, Oppenheim buggy, California invention.

CLASS 18.—Yates & Co., display of coal oil lamps; C. J. Becht, display of soda water fountain (Puffers).

CLASS 25.—D. Woerner, wine casks; E. A. Stockton, step ladders.

CLASS 33.—Hartshorn & McPhun, opaque window shades and fixtures; John Taylor, assayer's materials.

CLASS 30.—Heuter Bros., sheet wax, California manufacture; Whittier, Fuller & Co., white lead, California manufacture; California Bleaching Soap Company, California bleaching soap.

CLASS 45.—Miller, Seivers & Co., display of hardy evergreens and plants, \$25; cacti, \$5; begonias, \$5; roses in bloom, \$5; fuchsias, \$5; variegated geraniums, \$5; cut dahlias, \$10; single piece of floral work, \$10; basket of cut flowers, \$5; wreath of cut flowers, \$5; pair bouquets (15 inches high, not less), \$5; pair hand bouquets, \$5; bouquet for a bride, \$5; second most attractive and continuous display during the exhibition, medal and \$75; R. B. Woodward, display of ferns and cycloids, \$10; tropical plants, \$25; single palm tree, \$10; most attractive and continuous display during the exhibition, medal and \$100.

CLASS 1.—Thompson & Upson, H. W. John's asbestos cement for covering pipe; I. L. Merrill, steam packing; W. C. Campbell, boiler composition — "Hasadyder;" Thompson & Upson, H. W. John's double vacuum asbestos and felting covering.

CLASS 19.—Carmen Island Salt Co., display of salt.

CLASS 46.—Harris & Bradley, patent fruit dryer.

CLASS 40.—Mrs. J. C. Harper, display of crochet work.

CLASS 26.—C. Bruckhardt, display of Limburger cheese.

CLASS 43.—W. Battles, mechanical drawing by an apprentice.

The following are the awards for best display of fine arts:

Painting in oil by a local artist, "The California Alps," painted by William Keith, \$250; allegorical painting in oil, "Gil Blas," by Firman Bouvy, medal; still life in oil, "Fruit," by Charles Prosch, medal; animal painting in oil, "Boy and Dog," by Thomas Hill, medal; historical painting, oil, "Street Scene in Old Paris," by Jules Tavernier, medal; portrait painting, oil, Pebbles & Baldwin, medal; marine painting, oil, "A Storm," by James Hamilton, medal; flower piece, oil, "White and Red Cacti," by Thomas Hill, medal; painting in water colors, "Flowers and Butterflies," by Arthur Nahl, medal; painting on exhibition by other than local artists, "The Passing Show," by J. G. Brown, New York, medal; general display of water colors, G. G. Garibaldi, medal. For the largest and best display of paintings by any exhibitor, a prize of \$250 was awarded to D. Gale of Philadelphia.

The authorities think Miles' victory, dearly bought, though they commend the troops for bravery. Within the last year the Seventh Cavalry has lost 18 officers in action, and friends of officers in that regiment are petitioning for their transfer.

Nothing gives so life-like a look to photographs as real skillful retouching and coloring. When this is well done by a good artist, it makes a picture superior to oil in our estimation, and Morse's Palace of Art, No. 417 Montgomery street, is the place to find them.

PASSENGERS by the overland railroad are increasing in numbers.

General News Items.

THE gross receipts of the St. Louis exposition and fair foot up \$116,300.

THE Susquehanna Coal Company's men at Nauticoke have resumed work at 10% advance. JOHN FARGENHANS, of Boston, has been awarded the contract for roofing the Appraisers' Store in this city.

ATTORNEY-GENERAL DEVENS will ask Congress to appropriate \$225,000 to cover the deficiency for the Department for the past fiscal year.

INVESTIGATION shows that the Patent Office fire was not caused by incendiaryism or spontaneous combustion, but resulted from carelessness.

GOLD CARDIFF, the pedestrian who began to walk 1,500 miles in 1,000 hours, on Sunday, August 26th, in London, successfully finished his task on Saturday.

THE Nez Perces war is probably ended. Joseph's band has surrendered to Gen. Miles, after being kept for three days under fire in the ravines.

It is the intention of Sir Alfred Young to have the steamer *Pandora* refitted for another start for the Arctic regions next spring. He will probably try the Spitzbergen route.

The teller in the Branch Bank of Montreal, at Toronto, has absconded with \$10,000. He was well known in social circles and believed to have been a heavy speculator. The loss to the bank, it is presumed, will be heavy.

QUARTERMASTER GENERAL MEIGGS, in a communication just published, states that portions of the roof of the Capitol, and a large portion of that of the General Postoffice in Washington are liable to conflagration.

THE troubles on the Mexican border are increasing, and war is threatened. An armed body of 400 Mexicans have possession of El Paso in Texas, and threaten to massacre all Americans. The Mexicans claim that El Paso county belongs to Mexico.

At a meeting of merchants who suffered losses by the late riots at Pittsburg, a committee of three was appointed, with power to employ counsel, to represent all parties having losses, the expenses incurred to be divided among claimants in proportion to the amounts involved.

NOTICE.

I wish to call the attention of Newspaper proprietors and the Printing trade generally to something new, Column Advertisements Stereotyped on Metal Bodies. All standing matter should be stereotyped in this manner. The printer saves time and money by adopting this process; they are light and durable, and are cast with hard type metal, so that they will stand the pressure with the type; they are finely finished; and ready for the press in two hours after ordered. All forms sent home clean and free from dirt, grease and clay. The trade will find the using of these stereotyped column advertisements a labor-saving invention. Strict attention paid to all orders and prompt delivery of well finished work. I also manufacture shaved and unshaved leads; good metal and true. Shaved slugs of every description, cut to any length, and no extra charge. Liberal inducements to parties furnishing their own metal. Also, brass and metal foot slugs; figured slugs of every description; composing and make-up rules, etc.

Everything supplied by me is of superior quality and workmanship at the lowest rates for cash.

JAMES S. McLAREN, STEREOTYPY,

622 Clay Street, San Francisco.

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,

—ALSO—  
Hammered Iron of Every Description and Size  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. OFFICE: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

HENRY S. SMITH

## ÆTNA IRON WORKS,

MANUFACTURERS OF

## IRON CASTINGS

## and MACHINERY

OF ALL KINDS.

mont Street, Bet. Howard and Folsom

SAN FRANCISCO.

## SHEET IRON PIPE.

## Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

## PHELPS MANUFACTURING COMPANY.

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Log or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

## SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

## HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Girders, Bridges  
and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.  
Repairing promptly attended to at the  
lowest possible terms.

## GOLDEN STATE & MINERS' IRON WORKS.

Manufacture Iron Castings and Machinery  
of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

## CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cocks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Con-  
necting and Connections of all sizes and patterns, furnished  
with dispatch. PRICES MODERATE.  
J. H. WEED. V. KINGWELL.

California Machine Works,  
119 BEALE STREET, SAN FRANCISCO.

## BIRCH, ARGALL & CO.,

Builders of QUARTZ, SAW AND FLOUR MILLS.

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,  
And General Machinists.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

## IMPROVED PORTABLE

## Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS, ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## UNION IRON WORKS,

SACRAMENTO CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

## STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery  
constructed, fitted up and repaired.

Front Street, Between N and O Streets,  
SACRAMENTO, CAL.

## THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every De-  
scription Manufactured.  
Sole Proprietors and Manufacturers of  
Lynch's Ventilating and Illuminating Tile,  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

## STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

## McAFEE, SPIERS & CO.,

BOILER MAKERS AND  
GENERAL MACHINISTS,  
Howard between Fremont and Beale Sts., San Francisco.

## Metallurgy and Ores.

## JOHN TAYLOR & CO.,

Importers of and Dealers in

## ASSAYERS' MATERIALS,

CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNORIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
etc., manufactured by the Patent Plumbago Crucible  
Co., of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.  
Also, to our large and well adapted stock of

## Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

JOHN TAYLOR & CO.

## THOS. PRICE'S

## Assay Office and Chemical Laboratory,

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and re-  
turns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of  
the interior by Express, and returns made in the same  
manner.

Careful Analysis made of Ores, Metals, Soils, Waters,  
Industrial Products, Etc. Mines examined and reported  
upon. Consultations on Chemical and Metallurgical  
questions.

## Nevada Metallurgical Works,

No. 23 STEVENSON STREET.

Near First and Market Streets.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process  
for working Ores.

Special attention paid to Examinations of  
Mines; plans and reports furnished.

E. HUHN,

C. A. LUCKHARDT,

Mining Engineers and Metallurgists

## LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

Assayer and Metallurgical Chemist,

No. 611 COMMERCIAL STREET,

(Between Montgomery and Kearny.)

SAN FRANCISCO, CAL.

## INSTRUCTIONS IN ASSAYING,

Chemical Analysis, Determination of Minerals, and us-  
e of the Blow-pipe.

## HENRY G. HANKS

Will receive a few pupils at his new laboratory, No. 61  
Montgomery Street, up-stairs. TERMS MODERATE.

## STRONG & CO.,

Assayers and Metallurgists,

10 STEVENSON STREET, S. F.

## LEVI STRAUSS & CO.,

Patent Riveted

Clothing.

14 & 16 Battery St.,

San Francisco.

Patented May 12, 1873.  
USE NO OTHER, AND INQUIRE FOR THESE  
GOODS ONLY.

## ARTIFICIAL LIMBS.

MENZO SPRING,

MANUFACTURER OF

ARTIFICIAL LIMBS.

OFFICE AND ADDRESS,

9 Geary St., San Francisco.

Descriptive circulars, blanks for  
measurements, with instructions and  
price list free on application.

50 LARGE MIXED CARDS, with name, 13c. 40 in  
case 13c. 25 styles Acquaintance Cards 10c. Agents  
outfit 10c. DOWD & CO., Bristol, Conn.

## Machinery.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

## TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other Drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10,) 320 Sansome Street,

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2 1/2 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61 1/2

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Eschquer mill, Alpine Co., Cal. For further in-  
formation, apply to

D. J. O'HARRA,  
Reno, Nevada.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER  
J. C. Sanderling, Sole Ag't Pacific Coast,  
51 Fremont Street, S. F.

## THE LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of.

## BRUCKNER'S PATENT REVOLVING FURNACE,

For Chloridizing, Desulphurizing and  
Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEAR-  
ING AND MINING MACHINERY.

Send for our Illustrated catalogue.

## HUNT, DOUGLAS & STEWART Process,

Used in Connection With PURVINE

## Wooden Amalgamating Fans and Settler.

This is a complete, perfect and economical adaptation  
of the humid method to the treatment of Gold or Silver  
ores, associated with

## COPPER

And other base metals, or to ores free from base metals.  
It can be adapted to any first-class Gold or Silver mill, at  
a reasonable additional expense.

For further information, address

J. O. STEWART,  
Georgetown, Colorado.

## To Ship and Engine Builders, Steam ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.

Address and references can be obtained at office of Sci-  
entific Press.

# \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

## ENDORSED BY THE FOLLOWING PARTIES:

Green & Brewster, 312 Montgomery St., San Francisco, Cal.  
 D. F. Verdonal, 409 California Street, San Francisco, Cal.

**TO WATCH SPECULATORS**

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, so closely resembling gold that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold known. GENUINE AMERICAN MOVEMENT. EXPANSION BALANCE. BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS FROM \$150 TO \$200. It sells and trades readily, for from \$40 to \$100, and if you wish a watch for your own use or to make money on, try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are used on Railroads, Steamers, and in Manufactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express, on receipt of \$12, to any part of the Country, or it will be sent C.O.D., when the customer desires and remits \$2 on account. These elegant CHAINS weigh about Fifty Pennyweights, and the same pattern in pure gold would cost \$100. We sell these Chains at \$5 each. But we sell the Watch and Chain for \$12, sent by Mail in a Registered Package, post-paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

## The Newton Hydraulic Dredging Machine.

The engraving on this page represents the Newton hydraulic dredge and mining machine, which has been operating successfully in the East for the past two years, but has just been introduced on this coast. The first machine of the kind built here is now in process of construction at the Pacific iron works in this city. The engraving was made from a photograph of the dredge now in operation on Galveston island, harbor of Galveston, Texas. In this, A is the suction pipe lowered to one of its many working positions; B, B, vacuum chambers; C, vacuum column or dome to equalize pressure; D, discharge pipe; E, steam and water pipes; F, swivel or turn table on which discharge pipe revolves.

We have been shown letters from the owners of the Galveston dredge, in which they give the capacity at 5,000 cubic yards in 10 hours, and state that it works continuously in a satisfactory manner. The patentee guarantees that the dredge will perform this amount of work regularly.

The principles employed in the Newton hydraulic dredge are a combination of the well known forces of hydrostatic pressure, the formation of a vacuum by steam pressure and sudden condensation by means of cold water injected in the vacuum cylinders, and the disintegrating force of water jets discharged against the mineral to be dredged, at a velocity of 250 feet per second. The operation of the dredge may be briefly described as follows: The suction pipe, to which three disintegrating or "digging" pipes are attached, is lowered through a well in the boat containing the machinery, until its lower end rests upon or is near to the material to be elevated; a vacuum is then formed by driving the air from the vacuum cylinders by steam from the boilers, and at the moment when the air is thus expelled the steam is condensed by the sudden injection of cold water, and the material comes from under the pipe, whether it is mud, stone, gravel or clay. There being two vacuum cylinders, working alternately, governed by a large dome, the steam from the discharge pipe is continuous. The dredge is capable of working in any kind of material, and anything which will pass through the pipe can be raised. In fact, in several instances, the Galveston dredge brought up large pieces of anchor chain from the bottom of the bay, showing that pieces of rock and debris not larger than the pipe can easily be removed by the device. The suction pipe is telescopic, and the number of joints is regulated by the depth at which the machine is to work.

This machine will be extremely valuable in the tule lands of this State where so much dredging and levee building is done. The levees can be built by the dirt drawn up from the bottom of the sloughs or rivers and deposited by the machine in the proper place, 600

or 1,000 feet distant without rehandling. By this method the work can be done very rapidly and cheaply, and the levees can be built higher, wider and stronger than they usually are. The work of building levees in this State, along the tule lands, is one of large proportions, and hundreds of thousands of dollars are annually spent. This machine can accomplish the work more expeditiously than at present and with much less expense.

It is intended also to apply the Newton dredge to the purposes of river mining, a new method of mining now coming into vogue. In this class of mining the auriferous material is pumped up from the bottoms of the rivers which carry water enough to float the dredges. This dredge can take the material from below and discharge it high enough so that its golden

## Impurities in Commercial Copper.

The usual impurities occurring in the copper of commerce are iron, arsenic and silver, in small quantities almost invariably; bismuth very frequently, except in that from Russia and Australia; tin, antimony and sulphur occasionally, and lead almost invariably in sheet or bolt copper, but not in cake copper; with nickel, cobalt and gold less frequently. The effect of iron is to render the copper harder and paler in color; sulphur and antimony likewise harden copper, make it grayer in color and impair its malleability and tenacity. Copper containing 10 ounces of antimony per ton is stated by Dr. Miller to be quite unfit for use in the prepara-

## Relief Valves for Fire Hose.

Several years ago, Dr. Charles E. Blake, of this city, brought out here a relief valve for regulating the pressure in the hose of fire engines, to prevent bursting. The apparatus was tested several times with satisfactory results, but other parties were also in the field with similar devices, somewhat different in construction, none of which, however, covered the main idea. That is, although they all had patents, none of the patents covered the idea of a regulating apparatus in combination with a fire hose to prevent its bursting.

On examination, Dr. Blake found that the first inventor in this line was Thomas H. Bailey, who patented a device of the kind in 1864, but although he was the first inventor of a relief valve for fire hose—or rather water cylinders—he had not claimed it broadly as such. Dr. Blake then purchased the patent from the administrators of Bailey's estate, and has reissued it through the MINING AND SCIENTIFIC PRESS Patent Agency, so as to cover broadly the combination of an automatic relief valve with the hose of a fire engine.

Previous to this invention the only valve employed for relieving the pressure upon fire hose, to prevent it from bursting, in case the water passage through the hose should become obstructed, or in case of excessive pressure from the engine, was one operated by hand. This valve, however, was ineffectual, unless the engineer or other person whose duty it was to open and close the valve had previous notice that the pressure was increasing or had increased, and as these emergencies are always likely to occur instantaneously, without previous notice, the hose would

often burst before the relief valve was operated and, even then, the excitement which always prevails at a fire rendered a strict attention to this valve almost impossible.

Bailey's invention, the patent for which, as stated, has been reissued by Dr. Blake, remedied all these difficulties by applying a valve at some point between the engine or pump and hose nozzle that is automatic in its action—that is, it is opened by any excess of pressure in the hose or pump-cylinder, so as to discharge an additional stream and thereby relieve the inside pressure accordingly. The valve is kept on its seat by a spring, and it will therefore resist a pressure corresponding to the power of the spring, so that ordinarily it remains closed; but in case the pressure in the hose should be increased by any means, so as to overcome the tension of the spring and threaten to burst the hose, the spring will allow the valve to open.

In nearly every city in the United States, appliances of this character are in use, and Dr. Blake proposes to commence action against all of them to compel them to work under his patent at a suitable compensation.

THE NEWTON HYDRAULIC DREDGE AND MINING MACHINE.

contents may be sluiced off and saved.

One of these dredges has been, for some time at work at Chicago, where it has performed its labors successfully and in a satisfactory manner. During the Centennial exhibition a board of French engineers visited Chicago to witness the operation of the Newton dredge, and the board thought so well of it that the result was an order for one by the French government for trial. Capt. Eads, of Mississippi jetty fame, also thinks very highly of the device. One is also being completed for a large quantity of work at Surgeon bay, Wisconsin, as we see by the Chicago *Inter-Ocean* of Sept. 15th. The machine being built here will be put at work as soon as completed.

DURING the present week about \$40,000 worth of sugar mill machinery, manufactured by the Pacific iron works, the Fulton foundry and iron works, and McAfee, Spiers & Co., will be shipped to the Hawaiian islands.

THERE are between 300 and 400 men in Cornucopia district, Nevada.

tion of brass intended for rolling. Arsenic in small quantities hardens the metal, but does not impair its malleability to the same extent as antimony; while the presence of bismuth deteriorates the toughness of the metal. Small quantities of lead are occasionally added to copper intended for rolling, but the addition of only small quantities (one to two per cent.) of this metal renders copper unfit for the manufacture of brass plate and wire. The native metal occurring at Lake Superior is usually very free from impurities, but occasional specimens indicate a minute percentage of silver.

THE Carson *News* says that those returning from Bodie claim that but little work will be done in that section before next spring. The snow is always deep there in the winter time, and the wood being scarce, but few except those in business or employed in the mines will think of stopping.

PROFESSOR GEORGE HADLEY, the famous chemist died at Buffalo, N. Y., on the 10th inst.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Life Among the Lumbermen.

**EDITORS PRESS:**—The place from which this mountain letter is written is not down upon any of the maps of the State that it has been my luck to fall in with, and exactly where it is located it would be difficult for the average traveler to describe after a journey over these crooked hilly roads, the latter part of the distance being accomplished in the night. A trip into Lake county is liable to confuse one's geographical and astronomical knowledge, and notwithstanding all known rules to the contrary, a person need not be surprised after his arrival in this section to find the sun rising in the west and voyaging all day to the eastward, while at night the Big-Dipper and North Star maintain a stubborn position in the southern latitude.

The resident of San Francisco, who, during some future summer, may wish to enjoy the beautiful scenery and exhilarating air of these upper regions of Lake county, can easily secure, in one day's travel, a pleasing variety of river, rail and stage in the accomplishment of his purpose. The Vallejo steamer, which leaves the wharf at the foot of Market street at seven o'clock, will afford a pleasant morning ride on a beautiful sheet of water, of which California may justly be proud, and in a few hours the traveler will find himself transferred to the cars of the California railroad, progressing at moderate speed, with frequent halts, up the thrifty Napa valley, on his way to Calistoga. About noon, and before the prosperous ranches, neatly trimmed vineyards and distant mountain slopes begin to be monotonous, Calistoga, the present northern terminus of the railroad, is announced, and an opportunity afforded to refresh the inner man, preparatory to an afternoon stage ride. By consulting a table of distances, it is evident that in all directions there are mineral springs, mountains and quicksilver mines. I took passage on the Lakeport stage, which seemed to run the nearest to my objective point, and some 15 of us—men, women and children—were soon jolting up the steep side of Mt. St. Helena, behind a six-horse team, controlled by the well-known driver, Wash. Gwin. The climbing process was slow and tedious, but whenever opportunity afforded, whether going down a mountain or along a piece of level road, the horses were made to dash away at the top of their speed.

We were favored with many beautiful mountain views, and, under the constant changes of scenery, the afternoon drew rapidly to a close, until we halted for supper at Bassett's, about 30 miles from Calistoga, and bade the coach-load of passengers farewell. A vehicle, which runs daily between Bassett's and Adam's Springs, furnished the means of transportation over a few miles of rough road, and landed your correspondent among a lot of lumbermen, who are "roughing it" in the most approved style, and where the latch-string of hospitality always hangs out. With the aid of a steam mill and other modern improvements, the residents are making rapid inroads upon a heavily-timbered tract of 4,000 acres.

#### The Settlement at Rice's Mill

Is strictly on the pioneer order, and the visitor to this section need not expect to meet many of the luxuries of modern civilization. The pride of the place and the grand central pivot, around which everything else revolves, is Rice's steam saw mill, with two circular saws and a capacity of about 10,000 feet per day. Scattered about in the vicinity are a lot of wooden cabins, some with and some without fire places, and here in banks, constructed out of rough boards and filled with hay, supplied with heavy army blankets for bed covering, one can sleep soundly under the influence of the clear night air of the mountains. A temporary structure, which does duty as a cook-house and dining-hall, ranks next in dignity to the saw mill, and is presided over by an aged Chinaman, who claims to be one of the pioneers of the State, and, in broken English, tells his story of flush times, when everything was "heap-good" and he cooked in the mines for \$5 and \$6 a day. He made one trip to China with his earnings, several years ago, and has another and a final voyage to the flowery land in contemplation. He is as regular in his habits as a clock, and would as soon think of losing his pig-tail as having a meal five minutes out of time. He has a gong of a primitive pattern, by means of which he announces to the community that meals are in readiness. It consists of an old crosscut-saw plate suspended from a nail on the porch, and at six o'clock every morning he heats a tattoo that often awakens a response in the breasts of the neighboring mountains. Under the sharpening influence of this keen atmosphere, one soon comes to relish the plain and substantial meal of the lumbermen better than he would the best bill of fare that a city hotel can place before him.

#### Hauling Logs.

For the rough work of getting the huge logs out of the woods to the saw mill, the most

powerful motive power that can be obtained in the quadruped line is necessary, and if one wishes to take a slow ride, calculated to impress him with the ponderousness of cattle power, all he has to do is to accompany the "wbackers" on an expedition after a load of logs. So far as the rolling stock is concerned for strength and durability the war chariots of the ancient Romans would suffer by comparison. The truck wheels are made of the butt ends, sawed off, of huge logs, nearly five feet in diameter, and are heavily ironed, with axles and other wood an iron work in proper proportion. Mounted on this odd-looking establishment, 10 head of stout cattle propel us into the forest with the velocity of an ordinary canal boat and a force that bears down all opposition in the shape of mountain boulders and decaying stumps. The ease with which an experienced cattle driver will manage five yokes and snake out and load four or five heavy saw logs from apparently inaccessible places is enough to surprise a person not familiar with the mysteries of the ox-goad. The oxen, with practice, get broken so that they understand the business about as well as the driver and appear perfectly familiar with the jargon of ear-splitting cattle terms that the latter is continually launching at them. With the assistance of heavy chains, by the lumberman's peculiar system of engineering, a heavy load is soon hoisted into position, and the long procession of cattle is seen moving slowly along the dusty road, enveloped in a cloud that resembles a lazily-progressing whirlwind.

#### The Lumber Trade

Of this section is principally local in its character, owing to the difficulties in the way of transportation to a better market. The country is rapidly developing, however, and the proprietor of every new mountain ranch speedily becomes a purchaser to a greater or less extent. The development of quicksilver mines throughout this section has made quite an increase in the demand for lumber, and a large number of saw mills are doing a more profitable business in this county than an outsider would think possible. Speaking of quicksilver mines reminds me that a force of workmen are now engaged prospecting on Uncle Sam mountain, about five miles north of here, and are reported to have taken out several tons of excellent ore. The mountain, which stands rugged and barren, like a huge sentinel guarding Clear lakes, has the appearance of an extinct volcano and is obviously useless for anything except mining purposes. It is said to have been purchased for \$10,000 by the company that now owns and intends to thoroughly prospect it.

#### Mineral Springs.

I would, perhaps, be doing injustice to this section of country if I omitted to mention something about the mineral springs, in which the people appear to take a commendable pride. The ones with which I am most familiar are Siegler's, about two miles east of here. There are 32 different kinds of water, including hot and cold soda, iron and citrate of magnesia springs. It is to be regretted that they are not open to the public, as the place, if properly fitted up, would, no doubt, soon command a large patronage. The present owner is, however, a man of wealth, who evidently does not feel the necessity of converting the property into a paying institution. Adam's, Howard's and other springs in this county have been doing a prosperous business this season, and as a resort for invalids as well as the home of a healthy and prosperous people, Lake county bids fair to increase in notoriety.

Rice's Mill, Lake Co., Oct. 2d, 1877.

### The Mines of Eastern Oregon.

One of the notable features of mining operations in eastern Oregon may be found in the confidence and determination manifested by all who have any interest in these mines. They believe that the country has merit; and acting on this belief, they have been doing their utmost in the way of developing their claims; and, in many instances, have met with much success. In many sections of eastern Oregon there are splendid opportunities for the investment of capital in mining enterprises. One of the greatest and most prominent wants is that of good milling facilities; and these, when supplied, will result in a great change for the better, and put much more money in circulation. In no mining country has the prospector a wider field for operations, and there is no place to which public attention has been attracted where these sons of toil have displayed more energy and vigilance in looking after their claims and endeavoring to make them productive. Many of these men have undergone hardships and privations that are unknown beyond their own immediate circle of acquaintances. They look back to their boyhood days when they were surrounded by home comforts and experienced all the happiness measured out to boys that had pleasant homes, and everything glided along smoothly under the paternal roof. They were lured to the Pacific coast in the expectation of making big fortunes at short notice. They have toiled incessantly, and haven't the heart to return home again unless they have made a respectable stake. How many days and nights of solitude have these veteran prospectors put in while toiling in the mountains and endeavoring to "strike it," and wondering when they do whether they or some one else will carry off the rich prize that their incessant toil has incubated. In their lone cabins on the

bill, where they pass their long dreary nights, uncheered by any of those attributes that come within the category of home comforts, these poor fellows exist along from day to day, still hoping and still believing that the sun of fortune will shine upon them. Brave boys. May you all be ultimately rewarded for the many years of dreary and monotonous labor undergone, and the privations sustained in these laudable efforts to develop the country; for, if ever any class of men deserved to find an oasis in the desert of life, it is the careworn, honest and toiling prospector.

#### Rye Valley Mines.

There are many rich placer and quartz claims in and around Rye valley, and the outlook for this section of eastern Oregon is quite favorable. The camp is situated about 35 miles from Baker City, 15 miles from Farewell Bend, on Snake river, and nine miles from the Weatherby station. Some of the mines have been partly developed, and there is a five-stamp mill in operation. Many failures have been made in the attempts to reduce the ore, and it has been found that the roasting process is the only one through which the mineral can be extracted with profit. Some of the ore shipped to San Francisco has yielded as high as \$200 to the ton, and when crushed by the dry process the yield has been found to be very favorable. Arrangements are being made to crush the ore to better advantage by the introduction of suitable milling machinery, and we understand that parties from Portland intend building a quartz mill during the winter. Mr. Charles Green informs us that there is every prospect of there being a lively camp there next spring. The country seems to embody an immense mass of rich quartz veins, in which silver predominates, and with the right kind of crushing facilities near by, there can be no doubt that Rye valley will be more prosperous than ever. Rock has been found in the camp that goes as high as \$10,000 to the ton, but, by the process of wet crushing, the general yield from quartz has been light, and the camp has been kept in a hazy state in consequence. Quartz was first discovered there in 1870, but placer mining operations have been carried on since 1864. Where water has been abundant, some of the claims have yielded as high as \$300 a day, and parties interested in many of these claims have been doing well the past season. The Monumental, Macedonia and Green discoveries are the principal quartz mines. Each has been worked with a limited force during the season, and the prospects continue encouraging, so much so that the belief is entertained by many that Rye valley will, in time, become one of the prosperous camps of the country.

#### Monumental Mine.

There are some 15 men at work on this mine at the present time. The veins which have been encountered during the season are such as to afford great encouragement to the owners of the property, who expect next season to realize handsomely from their operations in that vicinity. These small ledges are all well defined, and vary from six inches to three feet in width. The strata, too, wear a promising appearance. A tunnel has been run, during the summer, for the purpose of tapping the main ledge about 400 feet below the surface. This will be reached in a few weeks, and there is every indication of the existence of an immense ore body, work on which will yield the company handsome returns for all their labors and investments. The mine is situated about 60 miles from Baker City. The stages of Messrs. Grier & Kellogg make trips to Independence twice a week, and the mode of locomotion from the last-named place to the Monumental, a distance of a few miles, is on the "hurricane deck of a cayuse." Independence is the central business point of that region. There are several good ledges in the immediate vicinity which have been worked to advantage this season.

#### Placer Mines.

There are some placer mines and gravel claims near Independence. W. Johnson & Co. have been doing a fine business with their claims this season. Bomer & Lucas have also been doing a fine business. Gardner & Thompson have a large body of water on Trail creek which they use for mining purposes. A considerable quantity of treasure has been shipped from Independence during the past summer.

S. A. Oglesby has a valuable placer claim at Jordan ranch formerly known as the Kelley bar. The claim is worked by hydraulic machinery, and when there is a full flow of water in use the profits are quite large. The water comes from Jordan gulch and Channing creek in the vicinity and has only been used recently at the rate of a couple of hours per day. The claim embodies about a dozen acres of good ten-dollar diggings.

Two miles below Oglesby's, at the mouth of Dixie creek, the Jett Bros. have dug a ditch on the Cariboo bar. They have taken out considerable money and are making preparations to work their claims on a large scale. They have laid 400 feet of iron pipe besides putting in a flume and doing other work.

Messrs. Gear & Hartwell are conveying water from Sisly creek to the bar on Burnt river. They have extensive diggings, and are certain to realize handsomely from them. Farusworth & Sisly are using a new wheel in their operations on Burnt river known as Scoll's central discharge wheel. The water is raised to a height of 40 feet. There is abundance of good placer ground on either side of the Burnt river for a distance of 26 miles. There is great need of a

ditch by which all this ground could be worked, and if an enterprising company would inaugurate such an enterprise there would be abundance of money in it for all concerned. There are many localities in eastern Oregon where placer mining can be profitably carried on, and with the supply of the needed facilities, we may look for a vast change for the better in the business of the coming season.

#### Notes.

A. D. Hoffstetter, Esq., is building a five-stamp mill about two miles from the Swaizes station, near the stage road. The machinery is all on the ground, and the mill will be ready for operations early in October. The mill will commence crushing rock from the White & Huffman ledge, which is about five miles south from the Burnt river at this point. One hundred tons of rock are now lying at the mine ready for crushing. A shaft is down 80 feet on this mine, and a tunnel runs in 170 feet. There is a considerable force employed at this mine, and, as the rock taken out is of good quality, a profitable season's work is assured. Mr. Hoffstetter has been engaged in mining in this vicinity for several years. His mill is constructed on improved principles, and there is no doubt but that the enterprise will pay him well.

Messrs. Estabrooks, Wood and Blanchard are working a five-foot ledge about six miles north-west of Conner creek, and, if all reports are correct, they have got a big thing there. Col. Estabrook was formerly interested in the Conner creek property, and while he and his associates had control of it they took out bullion to the amount of \$130,000. This money was mainly spent in Baker county, and resulted in the establishment of many improvements which have been of great permanent benefit to this section of the country.

H. B. Frans, who was the original discoverer of silver quartz in paying quantities in Rye valley, has a half interest in two mines known as the Tilden and Pungle, which are situated within three miles of the Weatherby station. He had a crushing of 20 tons of Pungle rock recently at McCord & Long's arrastra, which turned out quite well. Mr. F. is veteran in mining operations. He owns a quarter interest in a mine called the Bobtail, and has been the discoverer of several small veins in the vicinity. He operated in Owyhee with much success from 1864 to 1866, and went to Amelia City in '67. He is now the owner of several good claims in eastern Oregon, and much of the ground which belongs to him can be operated at a trifling expense, picks being the only implements required in working it, and no powder being needed.

One great drawback to the successful progress of mining in this vicinity is the inadequate milling facilities, the arrastra process of crushing being unavoidably very slow, and the wastage considerable. A good five-stamp mill would be of immense service in this section of the district. Mr. Frans located the Pungle on the 21st of July last, and if he has the nerve and pluck to hold out where he is at present, he will make a fortune in a few years.

About two miles from Weatherby station Mr. Thomas W. Porter and his father are running an arrastra which they moved over from Rye valley a short time ago.

James Hart arrived recently from the Heath district, which is about 25 miles from Conner creek. He informs us that a two-stamp mill is being built there and that the machinery is all on the ground for that purpose. It is being built by Messrs. Ruth & Heath who are old operators in that vicinity, and whose enterprise will be the means of keeping several mines in operation there during the winter.

The Jasper mine in Burnt River district has been turning out \$40 rock recently. It was crushed at Stearn's arrastra which is now being worked about a mile from the mine.

M. R. Speelman and J. Daily occupy a cabin together at Conner creek, which is one of the most old fashioned and comfortable edifices we have struck for many a day. The boys are very hospitably inclined. Speelman is an old Owyheeite, having formerly worked at the Silver Cord. Mr. Daily is from the "Hub," we believe, and intends to stick by eastern Oregon until he becomes a millionaire.

Water has been quite scarce in Rye valley during the past season.

A tunnel through Gold mountain would be an immense and profitable enterprise for that section of the district.—*Owyhee Avalanche.*

**SKILLFUL HAMMERING.**—At the Ghent exhibition of industrial art, an interesting collection of articles of new design and execution, one of the most interesting objects was a *grille*, three meters square, executed entirely in wrought iron by the hammer alone. This work of art, which embraces in its composition roses, each with 44 leaves, ferns and lilies, compares favorably with even the best medieval scroll-work. It was designed and executed by M. Wanters-Keockx, of Brussels, who was awarded the first prize, consisting of a diploma, a silver-gilt medal, and 300 fr.

THE cabinet of J. W. Virtue, Esq., at Baker City, embraces the finest collection of choice minerals to be found anywhere on the continent. The entire collection is worth \$10,000. Among the specimens are some rare gems of richness from the Virtue mine, which show amazing streaks of gold, and tell the story of the great wealth of the ledge. Mr. Virtue is very proud of this collection, as well he may be, and takes great pleasure in showing his rare cabinet of minerals and other specimens to strangers.—*Idaho Avalanche.*

## MECHANICAL PROGRESS.

## Notes on the Use of Belts.

A new work on a subject of interest in the machine shop is on the "Use of Belting." The writer is J. H. Cooper, and the following paragraph is quoted from the book: "Special conditions of successful practice, within which is embraced the driving capacity measurable by the area of contact, and modified by the state of the pulley and belt surfaces, and adhesive used, which must not permit the belt to slip or stick; the proper material for and treatment of belts; the utmost contact or arc of enrollment on the pulley; the proportion of diameter of pulley and length and width of belt for best running; the least rounding of the pulley faces, and the greatest smoothness obtainable; the hair side of leather belts always to pulleys, as it is the smoother side, for what is lost in contact must be made up in strain, and because the stronger fibers lie nearest the flesh side, and should be preserved; the amount of adhesion or traction developed by the tension employed; the fastenings, which should be of the best; the disposition of the laps such that the motion of driving will run with not against them; the employment of large pulleys, high speeds, and light belts; the careful putting on and skillful joining of belts; the running of them slack as possible, in the upper fold or strip; the avoidance of tightness by excessive strain or binders, and of lateral straining, as in some quarter-twist methods; the introduction of fly wheels, or like devices, for rendering the work of the belt uniform; the increase of driving capacity, for overcoming occasional resistances and starting frictions; the uniformity of belt section, and weight and the texture of material; the straightness of edges for smoother running at high speeds; the employment of gum belt for elevators, or to run in moist or hot situations, or where uniformity of section, without joints is desirable—in fact, in many places where leather is generally used, always avoiding twists, all devices rubbing the edges, and the contact with any solvent gum; the adoption of leather covering for pulleys, by which 33% of adhesion is gained; the securing of strips to the outer edges of single belts to increase adhesion; the running of a belt atop of another to make it drive; increasing the speed of a belt, which may be as high as a mile in a minute and be safe and advantageous; the introduction of the devices for augmenting the tractive pull of belts; the utilization of belts for imparting and arresting motion; the substitution of "wrapping connectors" for gear, as in twist-belt arrangements, which do not overstrain the fibers; these, and a multitude of other conditions, involving the essential elements of best practice, will be found on examination to be accepted and used by the numerous authorities noted, and to which the reader is directed and assisted by a complete index, arranged especially or ready reference.

**BAD RIVETING.**—A writer in the *Polytechnic Review* states that some time ago having occasion to use some boiler castings with tube-sheets attached, he started to take the sheets off, commencing by chipping, but finding, after a time, that he could save labor by hammering the rivet heads, the result was about on an average, *three blows with a pound and a half hammer per rivet*, to drive it completely away from its head. Now this is what might be called bad riveting, and it was perfectly new, having never been used. The result of a high steam pressure, on such work may readily be imagined. And yet, says the writer, we do not know that there are not hundreds of boilers in nearly the same condition, running very nearly up to their full capacity. Even though the work may not be so bad when new, corrosion will make it constantly worse, when leaks may start, and caulking is of no use; nothing but new rivets will answer. The rivets under discussion, were cut too short in the first place, and consequently the heads were under the proper size; then they were hammered too much, and a crack started around the head, and the whole structure of the iron rivet, as could be seen by examining them after they were removed. A good plan to prevent flawing the head in such a manner (in addition, of course, to good work) would be, to counter-sink the holes in the sheet, on the side of the heading, so as to form a fillet under the head which would serve the same as a fillet in castings, to avoid cracks.

**THE TELEPHONE FOR DIVERS.**—A new submarine armor is exhibited in Cleveland. The body, as described by the *Iron Age*, consists of its steel, while the limbs and helmet are of eaten copper, operating on ball-and-socket joints, overlaid with a coating of heavy rubber. The whole is, of course, water and air tight. To the head piece are two lines of rubber hose, one of these acts as an air supply pipe, and is attached to an air force pump, while the other carries off the bad air and acts as a telegraph wire connected with a telephone. There is a glass window in the fall of the helmet. On pushing the water, although it took five men to lift the armor, it contained so much air that it almost floated. More weight was attached, and it went to the bottom nicely. Here the diver could make himself plainly understood by telephone, but could not hear what was said above. If this apparatus proves to be sufficiently convenient to allow a man to

work in it, it will enable us to make a vast increase in the scope of submarine work. The depth at which work can be performed in an armor of this kind would only be limited by the strength of the material, while at present, with the armor in use, the depth is limited by the pressure which a man can sustain. It is possible that with the improved armor the length of time which a man can work under water will be greatly increased. In some situations it certainly will be.

**NEW USES FOR CAST STEEL.**—We notice by English exchanges that progress is being made in the employment of simple cast steel instead of forged. The first experiments were made a year ago with several eight and ten-inch shells, made out of steel without blows, which had been simply cast, tempered and reheated. These had penetrated armor-plate of a thickness equivalent to their diameter at an angle of 30°. These remarkable results were obtained not only in France, but also by the Italian and Russian navies. In such oblique firing the work of perforation becomes complex. The first action on contact is one of compression; this is followed by a certain amount of flexion, which tends to bring the projectile to a position perpendicular to the plate at the point of least thickness; at last after penetration of the conical head, comes the friction of the cylindrical portion against the rough edges of the hole, which tends to elongate the shell longitudinally. Such a metal resisting both tension and compression against instantaneous deformation is remarkable. Later tests have been as follows: Several pieces one and one-fourth inch square and six inches long were next submitted to the shock of a ball weighing 40 pounds, and allowed to fall from increasing heights. The supports were five inches apart, and rested on an anvil weighing 1,800 pounds. These pieces resisted well, and one of them did not break when the ball fell from eight feet in height, which gave it a bend in center of about one inch. The remarkable result of those first experiments show, if nothing else, that we have had to deal with a metal possessing very interesting and valuable properties, well worthy of the attention of engineers.

**NOTES ON CAR PAINTING.**—We find in the *Car Builder* a report of a meeting of an association of car painters, the following notes on sizing, which may be of use to our decorating workmen. Mr. Bennet had used English Japan gold size in mixing sizing for gold, but found that American sizing was superior, as it had more adhesive properties and the gold stood better on it. Mr. Stines said he also used American size as it made a cleaner edge, which was the only advantage he claimed for it. A gold sizing need not have any wearing properties, as it is more liable to crack. Gold will crack on all slow sizes. Mr. H. C. Burch preferred English Japan gold size clear, as the quicker it dries the better the gold will wear. Mr. Bennet had used a quick sizing on a number of cars, and found the gold was gone when the cars were brought in to be varnished at the end of the year. Mr. McKeon, used a size made with Japan gold size and rubbing varnish, with lead enough to color it. It was medium in drying, and gold stood well on it. Size should be made to dry in not less than five hours, and should not stand over 10 hours. It should dry about the same as the varnish put on over it. Mr. Kirkpatrick did not favor slow sizing, as the gold will crack and flake off on it. Varnish did not wear as well over gold as on color, the reason of which could not be satisfactorily explained.

**IRON SHIPS PLANKED WITH WOOD.**—It has been for some time under consideration by the naval architects of England, says *Iron*, to discover a mode of applying iron and wood in combination with shipbuilding, so as to give them the strength and durability of iron and the buoyancy of wood, enabling the vessel to be sheathed with anti-fouling metal, and, by this means, to obtain greater speed and weight-carrying powers. There has been a vessel of this description lately built in London, by Messrs. Mills and Knight—the *Ury*, a clipper three-masted schooner, of 236 tons register. She is an iron ship, planked with wood from keel to gunwale, which is fastened to the iron by means of wooden bolts with iron heads driven from the inner side of the ship, forming a secure fastening, and preventing all galvanic action, and over this planking she is sheathed with the ordinary yellow metal. Great results are anticipated with regard to speed from this method over the ordinary iron vessel. This method of planking is said to be adaptable for the restoration of old iron vessels.

**COST OF STEEL RAILS.**—The lowest prices for steel rails, says the *Railroad Gazette*, are those bid at the letting of a contract in Belgium, Sept. 5th. About 3,000 tons were wanted, and the lowest bid for the contract was a price equivalent to \$28.32 per ton at the works in Germany (Ruhrort) being about \$30 delivered at Malines in Belgium. The lowest price bid by a Belgian works was \$33. At the same time bids were received for the iron substructure of 30 miles of road of the Hilt system (substitute for wooden ties), and the lowest bid of \$27.16 per ton was nearly \$5 a ton lower than the price asked by the same works a year ago for a similar quantity of the same materials. By the way the quantity required for this substructure was 96 tons per mile.

## SCIENTIFIC PROGRESS.

## The Sun's Distance.

A writer for the New York *Tribune* notes that a somewhat unexpected result is obtained by the reductions of the British observations on the last transit of Venus. The data used are the eye observations (telescopic) in Egypt, Honolulu, New Zealand, Rodriguez and Kerguelen. The photographic observations have not yet been reduced, and there are also eye observations taken in India and Australia that may be utilized, but it is not believed that any great change in the computation will be effected by the figures obtained from the latter source, and the value of photographic observations is as yet an open problem. The new British calculations give for the value of the sun's parallax, 8".760, with a probable error of 0".013. This corresponds to a distance for the sun of 93,300,000 miles, with a probable error of 140,000 miles. The curious feature about this is that it is, in some measure, a return toward the old figures which made the sun's distance very much greater. These old figures from the transit of 1769 were believed to be in error to the extent of three or four per cent. But if the new figures for the parallax be conceded, it will be estimated about midway between the extreme views. The following table will make this plain: in it, No. 1 is Prof. Encke's estimate from the transit of 1769; No. 2, Prof. Newcomb's as used in the *American Nautical Almanac*; No. 3, the estimate of Leverrier adopted by Prof. Hind and given in the *British Nautical Almanac*; No. 4, the recent deductions from the British observations on the last transit:

Estimate.	Parallax, seconds.	Distance, miles.
No. 1.....	8.5776	95,292,000
No. 2.....	8.843	92,381,000
No. 3.....	8.95	91,329,000
No. 4.....	8.76	93,309,000

**GOLD IN THE SUNBEAM.**—Faraday's researches upon the nature of thin films of gold and other metals, and upon the size of finely divided particles of gold diffused through various liquids, are of a most interesting and refined character. Availing himself of the well-known reducing power of phosphorus, he floated small particles of it upon the surface of weak solutions of chloride of gold. In the course of 24 hours he found that the surfaces of the liquids were covered with films of metallic gold, which were thicker near the pieces of phosphorus "possessing the full golden reflective power of the metal," but becoming so thin by gradations, as to be scarcely perceptible. "They acted as thin plates upon light, producing the concentric rings of colors round the phosphorus at their first formation, though their thickness then could scarcely be the 1-100, perhaps not the 1-500 of a wave-undulation of light." By treating very dilute solutions of gold with phosphorus he obtained the metal diffused through the liquid in extremely fine particles, producing a beautiful ruby color. These particles, when in their finest state, often remain unchanged for months, and have all the appearance of solutions, but they never are such, containing in fact no dissolved but only diffused gold. The particles are easily rendered evident by gathering the rays of the sun (or a lamp) into a cone by a lens and sending the part of the cone near the focus into the fluid; the cone becomes visible, and though the illuminated particles cannot be distinguished, because of their minuteness, yet the light they reflect is golden in character and seen to be abundant in proportion to the quantity of gold present. Portions of gold so diluted as to show no trace of gold by color or appearance, can have the presence of the diffused solid particles rendered evident by the sun in this way.

**THE TOAD IN THE ROCK.**—Of the many stories told of finding toads inclosed in the solid rock, none have hitherto been authenticated to the satisfaction of scientific men; but *La Nature* considers that the following case, reported by one of its correspondents, is well vouched for: "In the building of a new chateau in the department of Aisne, materials from the old chateau were used as much as possible. This building dated from the end of the 17th century. One piece of stone had in the middle of one side a large moist portion; it seemed otherwise sound. The stone was sawn to remove the moist exterior (the moisture was attributed to a flow of water into the stone in the old building), and was put in position in a window. Time went on, and the stone (much to the builder's disappointment) did not dry, but presented a villainous contrast to its surroundings. It was at length decided to remove and sacrifice it, in order to find out the cause. On sawing right through the moist part, a large, irregular cavity (about 0.15m. in all directions) was found in the center, and in this cavity an enormous live toad, which by squatting had escaped the saw!"

**SAHARA.**—At a late meeting of the Berlin Geographical Society, a report from Dr. von Barry was read. The *Journal of the Franklin Institute* says: In his excursion into the Tuarez region of western Sahara, he found few grounds to sustain the theory that the desert was formerly the bed of a sea. He inclines to the belief that North Africa has long been free from a covering of water, as no traces of tertiary formations were found, and the sand dunes cannot be regarded as proofs of an ancient sea.

**CHEMISTRY AND EXPLOSIVES.**—In a recent address on the achievements of industrial chemistry, Prof. Abel made the following points in the line of scientific work as applied to explosive compounds: It is to a careful study of the influence which the physical characters of gunpowder (its density, hardness, etc.,) and its mechanical condition (i. e., form and size of the masses and condition of their surfaces) exert upon the rapidity of the explosion under confinement, that we chiefly owe the very important advance which has been made of late years in controlling its explosive force, in its application as a propelling agent, and the consequent simple and effectual means whereby the violence of action of the enormous charges now used in siege and ship guns, is effectually reduced to within their limits of endurance, without diminution of the total explosive force developed. But concurrently with these important practical results, the application of combined chemical and physical research to a very extended and comprehensive investigation of the action of fired gunpowder, has furnished results which possess considerable interest from a purely scientific point of view, as in many respects modifying, in others supplementing, the conclusions based upon earlier experiments and theoretical considerations with respect to the nature and proportions of the products formed, the heat developed by the explosion, the tension of the products of combustion, and the conditions which regulate it, both when the explosion is brought about in a close vessel and when it occurs in the bore of a gun.

**CHEMICAL ACTION ON GLASS.**—In the course of an article on this subject, the *Journal of Chemistry* prints the following paragraph: While, for ordinary purposes, glass is one of the most permanent of compounds, it is not so indifferent to chemical action as it appears. Water acts more or less on all kinds of glass. Faraday found that powdered plate-glass renders moist turmeric paper, showing that a portion of its alkali is readily dissolved out. Pure water, boiled for a long time in glass vessels, likewise becomes alkaline. Mere exposure to moist air gradually causes a decomposition of the surface of the glass, especially when there is ammonia in the air. According to Griffiths, a flint-glass bottle, in which a solution of carbonate of ammonia had been kept for a long time, was so much acted upon by the liquid that flakes of glass could be detached by shaking it. All acids also act upon glass, especially if there is an excess of alkali in its composition, or, as already intimated, if it contains lead. Wine and other acid liquids kept in bottles have often been found contaminated with salts, resulting from the solution of the metals in the glass. Wine is sometimes put into bottles made of glass wholly unfit for the purpose, and its taste and color are affected in a very few days by the salts produced by corrosion. We can imagine that serious mischief might occasionally arise from putting up domestic wines, fruit juice, and the like, in bottles not intended for any such use.

**AN ICELANDIC NEWSPAPER.**—A type foundry in St. Paul has lately furnished the types for the *Framvæni*, an Iceland newspaper, to be published in the Icelandic colony at Keeswatin, on the Red River, in British territory, about 60 miles from Fort Garry. This will be the first newspaper published on the American continent in the Icelandic language. The preparation of the types required the greatest care. They are in the Roman alphabet, but with a great many peculiarities in regard to accentuation, and are of a very antiquated form. The Icelandic language is something like the Norwegian language as it was spoken about 1,000 years ago.

**ELECTRIC LIGHT FOR CITIES.**—*Les Mondes* says that the municipal council of Exeter is the first public body in England which has officially recognized the value of the recent experiments in electric lighting. It has postponed a contemplated purchase of gas works, under a hope that electricity will soon be shown to be more satisfactory as well as more economical. The three rival systems, of the Gramme machine, the Alliance machine, and the electric candles of Jablockhoff and Denayrotze, are continuing their experiments in Paris, on a large scale.

**BRITISH ENCOURAGEMENT TO SCIENCE.**—An influential deputation of members of Parliament lately waited on the Chancellor of the Exchequer, to advocate the claims of the Scottish Meteorological Society. Sir Stafford Northcote said that the treasury was prepared to grant £1,000 for services rendered to the government during the past 20 years; and he gave encouragement for future appropriations.

**AROUND THE WORLD.**—The date of the sailing of the Woodruff scientific expedition is now fixed at October 25th. Only 50 had been "hooked" up to Monday of last week, although the minimum is 250. Gen. Macauley and Mr. Woodruff, however, expect to sail promptly, but in case of failure, the tour will be postponed a year. At least 800 have made inquiries, and over 100 have promised to go. The fee has been reduced from \$5,000 to \$2,500.

**THE CAVE-DWELLERS.**—According to *Nature* Dr. Mitchell, of Edinburgh, places the cave-man in the home rather than the stone age. His weapons were made of bone or horn, and highly finished, while his stone implements were extremely rude. The art faculty and the cranial developments of the cave people, show that they possessed a high capacity for culture.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

**EADLE.**—Amador Ledger, Oct. 13: This claim comprises a number of small veins opposite West Point on the Amador side of the river. Messrs. Pina and Marchin are the owners. Work has been prosecuted for several years, the result proving very encouraging. Latterly a ledge 2½ feet wide has been struck, 300 feet from the surface. It looks more like a permanent lead than anything hitherto found in that locality. The rock prospects well, but none has yet been milled. The mill will be fitted up and new batteries put in as the season opens next spring.

**THE PHOENIX.**—The Phoenix company are pushing every branch of business connected with their operations. The ditch has been enlarged in many places, where timbers jammed in floating. A strong force is still at work one mile north of town on Indian creek, where the flume passes over the creek. They are building rock piers under the two center braces to support the flume, as the timbers were considered unsafe for the heavy pressure of water.

BUTTE.

**DOUGLAS.**—Oroville Mercury, Oct. 12: We learn from gentlemen living in the immediate vicinity that C. M. Cry, of Eureka, is taking out gold pretty fast from his claims. As there is but little water he has little or no trouble in working it, and it is paying something like \$100 per ton. The Electric mine in that vicinity is also doing well, having got a good piece of rock for crushing, though the vein is not very wide, still it is rich and the prospects are that it will widen out as they go deeper.

The men who have had this in change have shown a good deal of pluck, and are now about to reap a reward for their faithful-

**BUTTE CREEK MINES.**—Butte Record, Oct. 9: We learn from Dr. Brotherton that several claims near the old mining camp of Centerville and Diamondville are paying well. We also learn that Shepherd and others, from San Francisco, having purchased the rights of the Messrs. Elliotts to ditch property in that vicinity, are at work with surveyors running a line for a ditch that will carry water to the high bank of gravel deposits on the west side of the creek, thus giving a chance to work extensive gravel lines upon which water has never before been introduced. We believe the gravel diggings of that vicinity, when supplied with water, will prove remunerative and lasting, and there is no prettier view to be found in that vicinity, which in the course of the water, the creek will open large areas of mining ground that is known to be rich in deposits of dirt. The water will be taken from the creek near the forks of Butte.

CALAVERAS.

**GETTING READY.**—Calaveras Chronicle, Oct. 13: The hydraulic miners in this vicinity are busy making preparations for the winter campaign. Emerson, Voth, Cook, Co., McCann, and a host of others are getting a "good ready," and everything points to the fact that the approaching wet season will be a lively one in a mining point of view. The tunnel miners are also busy. Dureya running levels for the purpose of having extensive "breasts" of gravel opened by the time he can get water to run his mill, and Garland is pushing work rapidly ahead to be in readiness when rain falls. Times will be very busy this winter.

**CLEANING DITCHES.**—The Mokelumne Hill Water Co. has a large force of hands employed cleaning ditch in anticipation of soon having a full head of water. The ditch is cleaned annually, from head to foot, just before winter sets in, the object being to maintain the capacity of the ditch at its maximum. We understand that the water in the ditch is gradually enlarging in volume, the old rights in the ditch are being renewed, and the flow of the springs.

**MOSQUITO GULCH JETS.**—Work is progressing steadily on the San Bruno, with the most satisfactory results. The 200-ft and 325-ft west levels are being run and a fine quality of ore extracted from both. The ledge varies from 2½ to 3 feet in thickness, all good milling ore. There is nothing like 200 tons of quartz now in the dumps. Hauling to Garland's mill has been commenced, and the company has been at work next Monday. The San Bruno has never before so vigorously and systematically worked as it is being at present. Work is shortly to be commenced on the Ood Hope, with the understanding that indications do not prove favorable the machinery is to be removed to the Vance mine. At the Banner the pumps are kept constantly running, the mine not being need of water yet. The machinery now works to it. It will take a week or ten days to finish taking out the water. Everything continues favorable at the Blue Jay. The main shaft is being sunk, the ledge continuing to show the superlatively rich rock that has rendered the mine so famous. The 200-ft level will be run shortly and stopes opened. Then the mine will produce a continuous stream of gold again. Operations at the Monte Cristo continue at about the same pace, the mine being one of the steady paying properties in the district. Cass & Co. and others owning quartz properties in the vicinity of Mosquito are busily at work.

REX.

**REX MOUNTS.**—Inyo Independent, Oct. 13: According to rumor, which we have so far been unable to authenticate, a very rich and extensive strike of ore has just been made in the Rex MOUNTS. The Superintendent, however, as just gone to San Francisco with some parts of the broken water wheel for the purpose of getting it repaired, and probably to induce the company to build a new mill one able to do the work required.

MARIPOSA.

**NEW MINE DISCOVERED.**—Mariposa Gazette, Oct. 13: On Saturday last, the 6th inst., two of our good citizens, Wm. Olmstead and Thos. Kendall, of Cathey's valley, called to see us at our office. They had struck a rich quartz vein over on the Quadoupe mountain, between Bridgeport and Cathey's valley. We were shown specimens of ore which showed free gold in abundance. Johnson had thought the vein for a considerable distance, and is satisfied of its quality and richness, and that it is an unmistakable vein, well defined.

NEVADA.

**RICH.**—Nevada Transcript, Oct. 14: The lode which was under the National hotel, in this city, and on which the Operative mining company have for a long time been running a tunnel, is proving to be very rich. The lode is of good size, is heavily sulphureted, and is liberally sprinkled with gold. One point of dirt taken out from the side of the lode on Friday, yielded \$250.

The North Bloomfield gravel mining company are going to let all the water out of most of their reservoirs this week, for the purpose of having them enlarged and improved.

**THE NEW ENGLAND** mining company are having a large lot of rock crushed. It looks well. The result of the crushing will exceed all former ones.

It is said that Oscar Maltman has sold that big pile of saline sulphurets, in front of his works, on the Orass Valley road, to the Pioneer reduction company. That company propose to work the sulphurets for silver as well as for gold. No attempt has ever been made to save silver sulphurets, in this section.

**THE MURKIN** mining company are taking out some fine looking rock.

**LITTLE YORK.**—John Hussey, of You Bet, was in town yesterday, and he informs us that very extensive preparations are being made in fitting up claims in that township. The mine owners there are never caught out by early rains, for they always take good care to fix up their dig-

gings just as soon as the water gives out. The prospects of that township were never better than now, and unless owners expect, if they have plenty of water, to take out more gold next season than at any previous one for years.

**CENTRAL MINE.**—Grass Valley Union, Oct. 13: The ore in the Centennial mine is of most splendid character. A crushing of 40 loads is now going through the John Smith Orleans mill, and a big result is anticipated. We heard John Trenberth, the Superintendent of the Centennial, propose to treat all hands if the ore were to be crushed and sold next season for \$100 a ton. The Centennial is at the top of Osborn hill, and Osborn hill is full of ledges that are rich in gold.

**HOMEWARD BOUND.**—Foothill Tidings, Oct. 11: The work of drifting goes on uninterruptedly on the second level of this mine, and any day may bring either header—north or south—to a chuto of good ore, though the place cannot be decided by survey, from the fact that the upper ground is so unevenly broken before, was broken. When one of these chutes is out in this level, Homeward Bound will be "on its feet," and from thence on be able to pay its own way, and very soon pay regular dividends. A new move, lately inaugurated, gives greater assurance for the permanency of this mine when the chutes are opened than ever—this being the securing of some adjoining ground, upon which good pay is known to exist.

PLACER.

**CLEANED.**—Dutch Flat Forum, Oct. 11: The South Yuba company's lumes and ditches have already received marked attention in being cleaned after the recent rains, and the company's mines at that point will be worked more extensively the coming season than at any time heretofore. The work necessary to put the Cedar Creek company's ditches in good repair for the present year is under progress of completion, they having less breaks than usual to contend with.

**WHITES IN PLACER OR CHINESE.**—The rumor mentioned in our last, that the Chinese now employed in our mines would be discharged, and the work be done exclusively by white labor in the future, proves to be a fact, providing white labor can be procured at \$35 per month and board. We have had interviews with several of the superintendents regarding this question, and without exception they all tell the same story, which is this: They all claim to be opposed to the bringing of Chinese labor to the mines, and they all claim to be under a tremendous expense in opening up mines which are yet unprospected, if they were compelled to hire labor at the wages formerly paid to miners, they would, in nine cases out of ten, be compelled to shut the mines down. But in order to show their good intent and preference toward their fellow white men, and they think they are as liberal with him as they can, consistently with the chances of the market, they offer to hire them exclusively, and pay them more per month with board than they pay the Chinamen without board. They say they are now determined to have white laborers, if they have to send to the Eastern States to get them; and if failing in that they say they will be compelled to shut the mines down or employ Chinese labor. As regards the boarding of their men, those who are married will be allowed the privilege of boarding with their families, and will receive as much extra per month as the average cost of boarding the miner in the boarding house.

**HAZARD.**—Placer Argus, Oct. 13: The Hazard mine, one mile from Michigan Bluff, of which Col. Keown is Superintendent, will start up about Thursday next. The buildings and works, which were burned down last winter, are now being rebuilt. The claims are believed to be part of the same lode which was burned down, and the mine was regarded as very flattering just before the destruction of its works. They spent \$33,000 in starting the mine in the first place, and they have always been noted for their punctuality in paying up their hands. Before the fire, the company ran the mine for three years and a half by steam machinery. During that time they ran 1,700 feet up the stream from 150-ft shaft. The mine has been drifting since the fire, and the prospects are very rich indeed, and they are driving forward for the wide part of the channel.

PLUMAS.
